1919

INDEX TO VOLUME 119

Mining and Scientific Press

July to December, 1919

| A | Page | B | Page |
|---|------|--|------|
| Abrasives and abrasive wheels, Fred B. Jacobs, new book..... | 212 | Babbitt, analysis of, James Brakes, new book..... | 731 |
| Accidents in mines..... Harry S. Cordell..... | 804 | Ballot, John, and flotation..... Editorial..... | 840 |
| In mining..... | 46 | Ball-mill drives at Rochester Combined mill..... | 7 |
| Addicks, Lawrence..... Editorial..... | 768 | K. Freitag..... | 447 |
| Afterthought metallurgy..... Herbert Lang..... | 400 | Bancroft, George J..... Genesis of quartz in veins..... | 528 |
| Mine, Horwood process..... A. H. Heller..... | 151 | Banquet at A. I. M. & M. E., Chicago meeting..... | 593 |
| Mine, methods..... S. E. Bretherton..... | 148 | Barker, W. M..... Handling and smelting of flue-dust..... | 226 |
| Ditto..... Frank L. Wilson..... | 147 | Ditto..... Smelting flue-dust and fine ore..... | 465 |
| Ahmeek Mining Co., company report..... | 173 | Ditto..... Utilizing furnace slag..... | 839 |
| 'Air Derby'..... Editorial..... | 588 | Barrows, David P., new president for the University of California..... | 874 |
| Alaska placer yield..... | 417 | Bartlett, Frank W., Engineering, descriptive geometry and drawing, new book..... | 668 |
| Alaska Gold Mines Co., company report..... | 943 | Bedding system at Cananea..... G. W. Price..... | 851 |
| Alaska Gold Mining Co., labor costs..... | 748 | Beer, Sondheimer & Co. and Minerals Separation..... | 868 |
| Alaska Juneau Gold Mining Co., labor controversy..... | 536 | George L. Nye..... | 372 |
| Labor costs..... | 748 | Belgian Congo copper..... | 73 |
| Alaska Road Commission work..... | 162 | Benedict, W. de L..... Gold, prices, and war debts..... | 557 |
| Albert, King of Belgians, in San Francisco..... Editorial..... | 623 | Benguet Consolidated Mining Co., company report..... | 546 |
| Allis-Chalmers Mfg. Co. new design of motors..... | 385 | Berry, Edwin S..... Mining at Braden..... | 593 |
| Amendments to compensation laws in California..... | 194 | Betts, Anson G..... Leaching flotation concentrate..... | 184 |
| American Association of Engineers..... Editorial..... | 321 | Bingham & Garfield Railway engineering features..... | 441 |
| A. I. M. & M. E. convention at Chicago..... Editorial..... | 387 | R. C. Gemmell..... | 431 |
| American Mining Congress..... Editorial..... | 801 | Blast-furnace v. reverberatory..... C. V. Corliss..... | 428 |
| Ditto..... Edwin Higgins..... | 913 | Ditto..... Editorial..... | 323 |
| Resolution regarding Minerals Separation..... | 856 | Ditto..... E. P. Mathewson..... | 79 |
| American potash..... Editorial..... | 180 | Bolshevism in Russia..... Editorial..... | 497 |
| Ditto..... Herbert H. Roe..... | 195 | Botulism..... George E. Collins..... | 185 |
| American Trona Corporation..... Herbert H. Roe..... | 197 | Boutwell, John M..... Platinum at Grand Canyon..... | 148 |
| Ames slide on Rio Grande Southern Railroad..... | 611 | Braden Copper Co. mining methods..... F. Cameron..... | 405 |
| Anaconda Copper Co., slag granulation..... | 118 | Bradford, Edw. A..... Economic education of labor..... | 713 |
| Anaconda Copper Mining Co., farm for employees..... | 159 | Brakes, James..... Analysis of babbitt, new book..... | 212 |
| Oliver E. Jager..... | 237 | Brannat, W. T..... Metal workers handy book, new book..... | 657 |
| Reduction works, apron feeder..... | 118 | Ditto..... Techno-chemical receipt book, new book..... | 924 |
| Slag granulation..... | 192 | Brazil, manganese in..... | 475 |
| Step-bearing for Wedge furnace..... | 835 | Breakey, A. S..... Selling prices of machinery since 1913..... | 148 |
| Antimony: Chemistry, metallurgy, uses, etc., Chung Yu Wang, new book..... | 262 | Bretherton, S. E..... Methods at Afterthought mine..... | 665 |
| Apex case, unusual..... R. T. Walker..... | 365 | Brinsmade, R. B..... Gold, prices, and war debts..... | 627 |
| Litigation, Elm Orlu v. Butte & Superior..... | 911 | Ditto..... Mr. Ingalls and Walkerian economics..... | 741 |
| Suits..... Editorial..... | 549 | Ditto..... Mining and smelting near Monterrey, Mexico..... | 54 |
| Applied mechanics, Charles E. Fuller and William A. Johnston, new book..... | 873 | Briquetting magnetite concentrate..... F. H. Mason..... | 930 |
| Science for metal workers, W. H. Dooley, new book..... | 237 | British Columbia mineral production during 1919..... | 193 |
| Apron feeder at Anaconda reduction works..... | 393 | Brodie, W. M..... Coquina: the shell-rock of Florida..... | 270 |
| Argall, Philip..... Crowe process..... | 634 | Brown coal in Australia..... | 703 |
| Ditto..... Crowe vacuum process..... | 508 | Brown, Gilmour E..... Mining engineering in the Orient..... | 773 |
| Arizona mining during 1919..... V. C. Heikes..... | 273 | Brunton compass, use of..... | 400 |
| Arizona Smelting & Power Co. construction..... | 321 | Bully Hill metallurgy..... Herbert Lang..... | 265 |
| Arrival of fleet..... Editorial..... | 614 | Mine..... Herbert Lang..... | 289 |
| Ashton, E. Conway, obituary..... | 204 | Bunker Hill & Sullivan M. & C. Co. operation of Sweeney mill..... | 670 |
| Asphalt production in 1917 and 1918..... | 167 | Bunting, Charles..... The Premier gold mine..... | 913 |
| Assessed valuation of Arizona mines..... | 549 | Bureau of Mines..... Edwin Higgins..... | 767 |
| Astronomy for surveyors, R. W. Chapman, new book..... | 891 | Burma mine..... Editorial..... | 369 |
| Aulbach, Adam..... Reminiscences of Prichard creek..... | 731 | Burro Mountain, Diesel engines at..... C. Legrand..... | 129 |
| Austin, F. E., Examples in magnetism, new book..... | 731 | Butler, B. S..... Production of copper..... | 943 |
| Ditto..... Induction coils in theory and practice, new book..... | 264 | Butte & Superior Mining Co., company report..... | 939 |
| Australian gold production..... | 591 | Accounting to Minerals Separation..... | 18 |
| Labor conditions..... William Motherwell..... | 255 | Electric hoisting equipment..... Oliver E. Jager..... | |
| Authority and brains..... N. H. Emmons, 2nd..... | | | |

| | Page |
|--|------|
| Dougherty, Ellsworth Y. Relation of regional deformations to ore in pre-Cambrian | 227 |
| Drill round, model of Walter S. Weeks | 848 |
| Steel, is yours too long? | 250 |
| Drum controller | 732 |
| Dumoulin, W. L. Crushing practice at New Cornelia | 305 |
| Dutch Guiana | 702 |
| Duty of the Mining Industry. George Otis Smith | 782 |

E

| | | |
|--|---------------------------|-----|
| Easton, Stanly A., the president among the miners..... | T. A. Rickard..... | 435 |
| Eaton, Lucien | Skip-changing device..... | 433 |
| Economic theories of Ingalls.... | R. B. Brinsmade.... | 627 |
| Editorial: | | |
| A. I. M. & M. E. convention..... | | 387 |
| Air derby | | 588 |
| American Association of Engineers | | 321 |
| American Mining Congress plan for enlargement... .. | | 801 |
| American potash | | 180 |
| Apex suits | | 911 |
| Arrival of fleet | | 321 |
| Blast-furnace v. reverberatory | | 428 |
| British interests in Mexico..... | | 356 |

| Editorial, cont. | |
| Peace Treaty | 3 |
| Perpetuation of mining-company organizations | 495 |
| Pressmen's strike in New York | 626 |
| Prohibition | 41 |
| Rand gold mining | 218 |
| Romineo Mines Co. prospectus | 140 |
| Salmon River district | 734 |
| Scholarships given by International Nickel Co. | 623 |
| Silver | 879 |
| Smith, Frank M. | 695 |
| State insurance; an experiment | 697 |
| Steel strike | 462, 734 |
| St. John Del Rey mine | 75 |
| Strikes | 496 |
| Sulman and flotation | 840 |
| Taxation of mines | 841 |
| Threatened coal strike | 625 |
| To young engineers | 552 |
| Treaty and the Covenant | 252 |
| Treaty and the Senate | 330 |
| Trial of Kaiser in London | 75 |
| Tule Canyon, Nevada | 461 |
| Use of injunctions in coal strike | 662 |
| U. S. Geological Survey quarters | 320 |
| von Wiegand, Karl | 180 |
| Wall Street and speculation | 218 |
| War Minerals Relief | 76, 142, 219, 322, 877 |
| Washington and entangling alliances | 355 |
| What shall we do with the Treaty? | 589 |
| Who said thrift? | 880 |
| Editorial independence | Editorial, 141 |
| Elaterite in Utah | 434 |
| Electric hoisting equipment at Butte & Superior mine. | |
| Oliver E. Jager | 18 |
| Locomotives, controller for | 693 |
| Electrolytic deposition of copper following leaching | |
| Percy R. Middleton | 149 |
| Precipitation of gold and silver | 448 |
| Electrostatic separation of zinc ores | 117 |
| Elmore, F. E. | Process patents, 479 |
| Elm Orlu case | A. L. Rinearson, 147 |
| Elm Orlu v. Butte & Superior litigation | Editorial, 284 |
| Ditto | Walter W. Lytzen, 364 |
| El Progreso property near Nacozari | 652 |
| El Tiro Leasing Co., company report | 943 |
| Emigration | Editorial, 462 |
| Emmons, N. H., 2nd | Authority and brains, 255 |
| Employment management | J. C. Metger, 83 |
| Engineer as a citizen | Editorial, 4 |
| In industry | J. Parke Channing, 635 |
| Engineering, descriptive geometry and drawing, new book | F. W. Bartlett and T. W. Johnson, 874 |
| Education, new book | Ray Palmer Baker, 873 |
| English speaking peoples | C. M. Campbell, 186 |
| Ditto | P. A. Robbins, 362 |
| European coal stocks | 238 |
| Post-war conditions, address by Herbert Hoover | 467 |
| Evans, F. H., obituary | 211 |
| Exploration methods | Hugh M. Roberts, 55 |
| Explosives plant at Nitro, West Virginia | Editorial, 427 |
| Extraction or recovery | E. M. Hamilton, 8 |

Mining and Scientific Press

Edited by T. A. RICKARD

Volume 110
Number 1

SAN FRANCISCO, JULY 5, 1919

15 Cents per Copy
\$4 per Year

AN INDEPENDENT WEEKLY PAPER OWNED, EDITED, AND MANAGED BY ENGINEERS

Ask Collins & Webb

Whatever your needs we can fill them.

"Collins & Webb Service" for mines is complete, comprehensive, efficient and prompt.

Our stock includes mining, milling and metallurgical equipment from complete plants to the smallest accessory.

What do you need?

Ask Collins & Webb

Here are a few items:

CRUSHERS
COMPRESSORS
BALL MILLS
HOISTS
PUMPS
ROLLS
ENGINES
MOTORS
CONVEYORS
AERIAL TRAMS
TABLES

Two warehouses with direct rail and water connections give exceptional facilities for quick shipment

COLLINS & WEBB, Inc.

MINING AND MILLING MACHINERY AND SUPPLIES
412 East Third Street, Los Angeles, Cal.

TONOPAH OFFICE: 503 STATE BANK & TRUST BLDG.

CABLE ADDRESS—Halharding—New York

Hardinge Mills

—AT—

Nevada Consolidated

The actual running time was 11 months, or to be exact—

7973 $\frac{1}{4}$ hrs.
without relining
 (349.8 tons per day)

| | | | | | |
|--|-----------|---|---|------------------------|-----|
| CAST IRON LINING CONSUMPTION—approximating 2 oz. per ton | | | | | |
| " | STEEL | " | " | $\frac{1}{2}$ oz. | " " |
| " | IRON BALL | " | " | $1\frac{11}{100}$ lbs. | " " |

The above figures are from an analysis of the paper by Mr. George C. Riser, Supt. Nevada Consolidated Concentrator, read before a meeting of the American Institute of Mining Engineers.

We will be pleased to send you a copy of the paper upon request. It contains details of crushing—unbiased—technical and non-commercial.

Also write for complete data on ball-milling practice in other large plants.

LEADVILLE, THE SUPERIOR PORTABLE HOIST

Here it is shown lifting heavy timbers at the Nyack yards of the International Shipyards, Inc.

In Mines, Mills, Factories, Shipyards and large building operations, the LEADVILLE has proven its value in a wide range of work.

Compact and light in weight, it can be readily transported and quickly installed. Attaches to any size drill column or to timbers.

Uses Compressed Air or Steam.

Has Reversible Motor and Powerful Brake.

While designed for use in mines, many other industries have discovered how convenient and practical the LEADVILLE is.

It is so adaptable that anything within the limits of its capacity, can be hoisted, moved or hauled.

MODEL 5

THREE MODELS AND THEIR SPECIFICATIONS

| | LIFTS | WEIGHT | DRUM CAPACITY |
|--------------------------|-----------|----------|---------------------------------------|
| Model B | 700 lbs. | 190 lbs. | 500 ft. $\frac{1}{4}$ inch cable. |
| Model 5 | 1200 lbs. | 360 lbs. | 550 ft. $\frac{3}{8}$ inch cable. |
| Model 6 for Hemp Rope | 1200 lbs. | 396 lbs. | 260 feet, $\frac{3}{4}$ inch rope, or |
| | | | 380 feet, $\frac{5}{8}$ inch rope, or |
| | | | 620 feet, $\frac{1}{2}$ inch rope. |

MODEL 6

Let us send you full information concerning the LEADVILLE.

DENVER, COLORADO

"Perfect" WIRE CLOTH DOUBLE CRIMPED *is an essential part of every milling plant*

Thousands of satisfied users testify to the superiority of Ludlow-Saylor 'PERFECT' double crimped wire cloth for mill screening of all kinds. Its long life under hard usage—its lasting rigidity and firmness and the uniformity of product delivered make it the ideal screen for any mill. Re-orders are invariably the case once 'PERFECT' screens are used.

It's the Double Crimp that counts

The wires are not bent but *crimped*—they curve gradually and gracefully over and under the intersecting wires without any sharp angles.

Every wire is kept firmly in place—no shifting to cause wear and unevenness.

All strain is equally distributed, every wire being a flat arch, the crimps forming the buttresses.

Every particle of ore passes through as soon as it has attained the required fineness. The reject is free from fine particles.

Let your next replacement be 'PERFECT'.

Write today for the Ludlow-Saylor 'PERFECT' screen book.

It contains valuable information for all users of screens—data compiled from many years experience.

TURBINES

FOR BELT CONVEYORS

DIXON GRAPHITE CUP GREASE

Some find that twice a year is plenty often enough to fill the cups on their conveyors with **Dixon's Graphite Cup Grease**. That assures a smooth-running carrier; saving power, saving the life of the belt, saving shut-downs.

This grease is thoroughly waterproof. Its lubricating qualities are unequalled. It is in use the world over on every class of machinery subjected to dampness in the work of mining, milling and smelting.

It is very much worth while to find out how Dixon's will apply to your own case.

JOSEPH DIXON CRUCIBLE COMPANY

JERSEY CITY, N. J., U. S. A.

ESTABLISHED 1827

PACIFIC COAST OFFICE:
155 SECOND STREET,
SAN FRANCISCO

DODGE

Do you buy rope by the pound or belt by the inch?

In any shop the prime mover is either a rope or belt drive. When a Dodge rope drive can be used, the service is more nearly continuous and the upkeep cost lower.

The belt itself constitutes the larger portion of the cost of a belt drive; while in the case of a rope drive the rope is the least expensive part of the installation.

In either case the belt or the rope is the wearing part.

The economy of buying Blue Strand Manila rope by the pound against replacing belt of excessive width is immediately apparent — and the rope delivers more nearly 100% of the engine power than does the belt.

Complete freedom from tightening and lacing heavy belts with the attendant shutdown to production is another big argument in favor of a Dodge rope drive as a prime mover.

There are other points of superiority shown in our book "25 Years of Rope Driving". Send for a copy and see for yourself the application of Dodge rope drives to each industry according to the particular requirements of that industry. It is free to the engineer or master mechanic of any industrial plant.

To overcome the high cost of man power by strict economy in the use of mechanical power should be the aim of all engineers at this time.

TRAYLOR "BULLDOG" JAW AND GYRATORY CRUSHERS

and

TRAYLOR HEAVY DUTY CRUSHING ROLLS

have reached the highest stage of development yet attained in any crushing equipment in the economical use of mechanical power per ton of material crushed.

"Bulldog" Gyratories have a shaft that is much shorter and 100% stronger than standard Gyratory shafts—an eccentric that is both longer and of greater diameter than others and a positive forced feed lubricating system.

"Bulldog" Jaw Crushers have the strongest and lightest pitman of any Jaw Crusher in the world—the only frictionless toggle system and a simple and positive method of lubrication.

All patented features that make for as great and lasting economies in Jaw and Gyratory Crushing as the thoroughly tried and proven "Fleeting Roll" in Traylor Heavy Duty Crushing Rolls has brought about in roll crushing, economies so well known and so essential that Traylor Crushing Rolls have become the world standard.

Bulletins PJ-2 and PJX-1—Jaw Crushers

Bulletins PG-4 and PGX-1—Gyratory Crushers

Bulletins PR-2—Crushing Rolls

are fully descriptive of Traylor money-saving crushing equipment.

Write the nearest Traylor man for them—now.

Even when they shaved Worthington helped

"SHOES shined and faces shaved"—if any one phrase from the orders of the day will be remembered, that is it.

With the American soldier the morning shave was a habit, even under fire, so Worthington's part in making razor blades at once assumes a peculiar importance.

And while Worthington compressors and vacuum pumps in South Boston were helping to make razor blades, other Worthington equipment was playing its part in factories making soap, steel mirrors, brushes, and indeed practically everything that went into the recruit kit.

It is significant of Worthington's ability to meet emergencies that, although the eight Worthington factories were all delivering unprecedented quantities of war materials, it was still possible for them to supply the wants of those industries essential to everyday life.

PUMP YOUR SUMP

With a CAMERON

You are insured against mine flooding when you pump your sumps with Camerons. These pumps require little attention, less care and no rest.

The passage of time has no effect upon Cameron Pumps, and you do not have to worry about them.

Put Camerons to work and your pumping problem is solved.

In addition to Cameron Direct Acting Pumps, the company manufactures an extensive range of Centrifugal Pumps.

THE FOLLOWING BULLETINS WILL BE SENT YOU UPON REQUEST:

7204 Cameron Steam Pumps.

7152, 7251, 7150, Cameron Centrifugal Pumps.

The Hand That Rocks the Cradle Runs the "JACKHAMER"

The illustration furnishes still another proof of the ease with which "Jackhamers" can be operated. Aside from the "Jackhamer's" light weight, it is free from complicated mechanism, easy to control and so well proportioned and designed that a woman can run it without drain upon her strength.

"Jackhamers" are portable rock drills which lose no time, waste no power, cost little to maintain and concentrate their entire mechanism upon the business of drilling rock speedily and efficiently.

*Bulletin 4321, descriptive of dry and wet
"Jackhamers" will be sent you upon request.*

GENERAL ENGINEERING COMPANY, Inc.

(Established 1906)

J. M. CALLOW, President

SALT LAKE CITY, UTAH,
U. S. A.

120 Broadway, New York

336 Sparks Street, Ottawa

Our ore testing laboratory is one of the most completely equipped in the world, and is not only equipped with all modern ore treatment devices, but is practical in its design and arrangement.

The present metal market conditions, calling for decreased production, are of course only temporary. These conditions offer special incentives for preparing for improvement in ore treatment methods in existing plants, and the determining of correct processes for mines not yet equipped with treatment plants, so that full advantage may be taken when the prosperous times that are ahead for the mining fraternity have materialized.

We shall be glad of the opportunity to consult with you on these matters.

Our offices and plant are located in our own building near the center of the business district. We cordially invite visiting metallurgists and engineers to call on us when in the city.

Amongst the many samples we received last month was one shipment from Australia and one from India.

Ask for the Fourth Edition of our Ore Testing Bulletin

Senn Amalgamators

pan the gold into the quick or onto the amalgamating plates.

They save the very coarse and the very fine gold, and the rusty gold.

Every inch in the surface of the amalgamating plates covering the deck moves 40 feet per minute. Every particle of pulp requires about 3 minutes to travel from the amalgam bowl to the tailings launder, across the amalgamating surface.

The plates of one machine are therefore equivalent to 120 lineal feet of stationary plates, but they are more efficient than any amount of stationary plates, because the panning motion keeps the pulp loose and settles all the gold into the amalgam.

Senn Concentrators

pan the finest as well as the coarse concentrates onto a moving belt that withdraws them from beneath the suspended gangue.

The continuous panning motion of the Senn keeps the barren gangue suspended and loose in a thick pulp. The thick, slow moving pulp avoids mashing away the very fine values.

One Senn Concentrator Takes the Place of Four Ordinary Vanners.

THE SENN WILL SAVE ALL THE PAN CAN SAVE

Senn Concentrator Company

WATERBURY ARMORED ROPE

End view of worn rope.
No broken wires.

tained longer as the rope wearing to a smooth surface does not change the score of the sheaves or drums.

The flat wires when worn through do not project, but are pushed down into the interstices of the rope, thus giving a greater wearing surface than is ordinarily obtained.

Note in the illustration that the flat wires are held transversely to the axis of rope so that the same do not affect its flexibility.

The initial factor of safety is maintained longer in Waterbury Armored Wire Rope (Gore Patent), than in any other construc-

Side view of worn rope.

PAGE 104

WATERBURY ARMORED ROPE

This big Dipper Dredge in service on the Pacific Coast is equipped with Waterbury Armored Rope.

The strands are intended to take all strains to which the rope is ordinarily subjected, and the flat wire covering is for the purpose of protecting the strands from abrasion and in retaining the strands in retaining lubrication.

or is the lack of in the strands themselves. It is impossible for which is the failure.

and in the fact rope core, or,

PAGE 105

You couldn't ask for better proof

Put a Waterbury Armored Rope into service alongside ordinary bare wire rope, and about **the second time the bare rope has to be replaced**—while the original armored rope is still doing duty—you'll realize the difference that protecting flat wire armor makes. The harder the service, the quicker the economy in a Waterbury Armored Rope shows.

Waterbury Armored Rope (Gore Patent) is a wire rope with each strand served with flat wire, which protects the strands of the rope from abrasion and aids in retaining the internal lubrication. (The details of this construction and of other kinds of ropes, you'll find in the Waterbury Rope Handbook.* It tells all there is to know about rope—illustrations, diagrams, tables, statistics and all that.)

In service where bare rope is usually short-lived, Waterbury Armored Rope shows most convincingly the value of this patented design and the quality that is in every Waterbury rope.

Built to Stand the Vibration of Geared Service

The severity of operating requirements for ball mill drives only accentuates the qualities of ruggedness in Westinghouse CW Motors, and testifies to the characteristic Westinghouse thoroughness in design and construction which takes into account every possibility of actual service.

Westinghouse CW Motors

are simply, but very ruggedly constructed. They will operate continuously with very little attention and they possess that high starting torque and high efficiency essential to ball mill service.

WESTINGHOUSE ELECTRIC & MFG. CO.,
East Pittsburgh, Pa.

Westinghouse

Giant

SEMI-DIESEL OIL ENGINES

FOR most power users Giant Semi-Diesel Fuel Oil Engines are the ideal prime mover for all power purposes.

Because they operate successfully on the lower grades of cheap fuel oils, the fuel cost in comparison with other forms of power is exceedingly low. And because of their unusually simple construction they are particularly suited to heavy duty service under conditions preventing the employment of highly trained attendants—another operating economy.

Giant Fuel Oil Engines are built in capacities from 12 to 160 horse power, both single and duplex types. They usually pay for themselves, wherever installed, within a year's time—and then pay dividends on the investment. Ask for Bulletin 34-W.

Wilfley Concentrating Tables at The Rare Metals Ore Co., Rollinsville, Colo.

WILFLEY SELF-OILING HEAD MOTION

WILFLEY ROCKER BEARING

Wilfley "Straight-Line" Efficiency— It "Gets There"

The exact character of the riffling on the Wilfley Concentrating Table, which produces such uniformly satisfactory results, can be seen in the above illustration.

The riffles are constructed on a true table throughout, the lowest point of which is at the diagonal line, where the riffles come to a feather edge. The highest point of the riffled field is at the head of the shortest riffle next to the feed box.

The purpose of riffling the field as illustrated is to give necessary holding, conveying and directing force to the material under treatment, so that the mechanical action of the head motion together with the cross flow of wash waters may harness the line of separation along the diagonal tips of the riffles.

Higher extraction has been the reason for the installation of the 22,000 Wilfleys now in use.

Where floor space is limited, Wilfleys can be set close together and still be accessible at all points. There are no angles to take up valuable room.

Mechanical refinements from time to time give constantly increasing capacity, economy and long life to these famous concentrators.

There is a Wilfley for all kinds of work and all grades of ore.

Tanks Adapted for Mining

"National" Settling or Agitating Tank.

Our Portland factory is located in the heart of the great Douglas fir forests where the best of tank woods is always on hand. We also make tanks from California Redwood. Our tanks are manufactured by our own process and are guaranteed to give the most satisfactory wear.

We furnish standard cyanide plants manufactured from either fir or redwood lumber. Careful attention given to special installations. Ask for information.

The Iron Dike Mill where "National" tanks are used in helping to keep up a daily capacity of 150 tons.

We make all kinds and sizes of wood tanks. Tanks up to 10,000 gallon capacity are kept in stock ready to be shipped by either water or rail on a few hours' notice. "National" tanks have been used in all kinds of mines and have stood up well under the hardest kind of service. U. S. Government has used carload after carload. You will be pleased with them. Get our prices, and specifications.

THE NORDSTROM LUBRICATED PLUG VALVE

is the invention of Mr. S. J. Nordstrom, a mechanical engineer, for many years engaged in the design, construction and operation of cyanide plants. In the course of this work, Mr. Nordstrom was impressed with the obvious defects of standard plug cocks and gate valves for handling cyanide solutions and slimes. His Lubricated Plug valve was conceived to remedy these defects.

**"IT CAN'T STICK
and
IT WON'T LEAK"**

The basic principle of the Nordstrom patent is the combination in a plug valve of lubricant conduits and a lubricant chamber at the base of the plug so positioned that when pressure is applied to the lubrication screw this pressure operates to lift the plug from its seat and to distribute the lubricant over the bearing surfaces.

The Plug Valve has been in use in the mining camps of Mexico—particularly in Pachuca and El Oro for over three years. In several plants it has been adopted as standard equipment to the exclusion not only of ordinary plug cocks but of gate valves as well, for handling cyanide solutions, slimes, water and air.

You'll want to adopt the Nordstrom, too. Send us a trial order and use it in place of that troublesome valve which always sticks.

The Jordan Spreader leveling waste material excavated in stripping operations by Oliver Iron Mining Co.

The JORDAN SPREADER

Eliminates gang labor and is saving thousands of dollars for many progressive mine, mill and smelter operators.

THE GREATEST OF ALL LABOR-SAVING DEVICES

The Jordan Spreader displaces 2,500 men at a saving of \$7,844 a day. By handling 25,000 cu. yards of material a day at a cost of \$116, it has proven indispensable to numerous mine and smelter operators.

If you have one hour of work a week for the Jordan—disposal of overburden, tailings, slag, construction of stock piles, railway work, snow removal, ditching and numerous other purposes—the Jordan will soon pay for itself.

Jordan Spreaders are built of the very best materials. Many, after 15 years of continuous operation, are still on the job and rendering the same efficient service as when new.

Send for details as to operation and performance and let us tell you just what the Jordan will do on your particular work.

THE MARATHON MILL (Trunnion Type)

A few reasons for Marathon superiority as reported in a paper presented before the American Institute of Mining Engineers by an independent investigator of the largest American Mining Companies :

CRUSHING PRINCIPLE of the Marathon is by line contact absolutely confining the ore. In the ball mill point contacts prevent any confinement.

GREATER CRUSHING WEIGHT accounts partly for larger capacity, as Marathon round grinding bars weigh fifty per cent more than balls.

HORSE-POWER OF MARATHON only one-quarter to one-third as much as ball mills of same capacity, as rods enable a grinding drum with smaller diameter and greater length than the ball mill principle permits.

PRODUCT FROM THE MARATHON is practically uniform for whatever desired mesh adjusted, while the ball mill discharge contains much larger over-size and an excess of finer than desired.

CAPACITY OF MARATHON per horse-power exceeded ball mills from two to four times in competitive tests.

WEAR OF GRINDING PARTS is about one-quarter pound or four ounces of steel per ton of ore ground.

Copies of this very complete report by Mr. A. P. Watt, a well known Mining Engineer of New York, will be sent free upon request ; also data as to competitive grinding results accomplished by some of our other customers.

A number of the new improved Trunnion type of Marathon Mills have been in continuous operation the past two years with great success.

INDUSTRIAL PROGRESS

A lubricated plug-valve.

COMMERCIAL PARAGRAPHS

Established May 24, 1860, as The Scientific Press; name changed October 20 of the same year to Mining and Scientific Press.
Entered at the San Francisco post-office as second-class matter. Cable address: Pertusella.

Branch Offices—Chicago, 600 Fisher Bldg.; New York, 3514 Woolworth Bldg.; London, 724 Salisbury House, E.C.
Price, 15 cents per copy. Annual subscription, payable in advance: United States and Mexico, \$4; Canada, \$5; other countries in postal union, 25s. or £6

Electric power equipment when properly applied is eliminating shut-downs and thereby boosting production in metal mines the world over.

G-E Motors Keep Mills Running

Mills that require nearly double power at starting and run continuously in moist, gritty air, are being driven by G-E motors.

The splendid operating records of these motors in this service are used as a basis for repeat orders when extensions are planned

which require dependable, heavy-duty motors.

Scores of G-E motors drive mills at leading mining companies throughout the country.

Our engineers will be glad to show you why.

Write our nearest office for bulletins on Electric Power in Metal Mining.

40-283

General Electric
 General Office  **Company** Schenectady, N.Y.

CONGRESS has been advised that the Alaska Engineering Commission expects to complete the Alaska Government railroad from Seward to Fairbanks, in 1921. The cost is estimated at \$50,400,000, or at the rate of \$73,200 per mile. The mining public will welcome the completion of this important project, which will render accessible a rich and interesting part of the national domain.

ON June 28, at the very time when the Treaty of Peace was being signed, 900 Germans who had been interned during the War were shipped aboard the transport 'Martha Washington' on their return to Germany. They are said to have gone at their own request. Some 1800 others are due to leave on July 1. It might be well to make it July 4, as an item of celebration, for there can be no doubt that the departure of these anti-American elements is favorable to national solidarity.

FROM the columns of the 'Financial Times', of London, we get the news that Mr. Henry Gardner, formerly of Henry R. Merton & Co., Ltd., applied for a license to organize a new company of metal-brokers, but his application was opposed by the Board of Trade on the ground that his company would be "subject directly or indirectly in the conduct of its business to enemy influence or association," these being the words of the Act passed to deal with such cases. He appealed from the Board of Trade to the Court of the King's Bench and was awarded a favorable judgment, the Court stating that no evidence had been found to show "that Mr. Gardner intended to come under the influence or intended to associate with Germans" in his business. Indeed, the testimony all served to prove that, as the Public Trustee stated, "he was a thoroughly loyal and patriotic Englishman." Since this favorable judgment was given, Mr. Gardner, who is a Scot, has announced the formation of a metal-dealers company in association with other non-German former members of the Merton firm, and we wish him and them every success.

ENGINEERS Licensing Bills have been before the State legislatures of Colorado and California. In the Rocky Mountain State the bill was passed by the Legislature and signed by the Governor before the mining engineers heard about it. Nothing could be done to prevent the enactment, but the Governor was persuaded to appoint a Board of Examiners that would interpret

the Act in a reasonable manner. The Board consists of Messrs. H. I. Reid, H. S. Sands, Frank E. Shepard, Robert J. Grant, and, *ex officio*, the State Engineer. We are informed that engineers from outside the State coming to Colorado to examine mines will suffer no inconvenience, whether they have a license or not, as the Board is in favor of using the soft pedal until such time as the next legislature shall have had an opportunity either to repeal or to revise the law. In California the mining engineers, in co-operation with other branches of the profession, introduced a Licensing Bill because the architects had attempted by legislative action to compel the employment of a licensed architect for the erection of any structure, thereby putting the engineer out of business except as the employee of an architect in the erection of mill-buildings, head-frames, power-stations, and the like, even down to the humble woodshed in a man's backyard. In order to circumvent this scheme all the engineers united in self-defence and introduced an Engineers Licensing Bill placing themselves on a parity with the other professions. This had the desired result, for both bills were withdrawn, the architects finding themselves euchred. Apparently this matter is settled definitively in California.

IN this issue we print the entire text of the presidential address delivered by Mr. Hugh K. Picard before the Institution of Mining and Metallurgy in London. It is well worthy of the large amount of space given it, as our readers will discover for themselves. Mr. Picard is a metallurgical engineer associated chiefly with the development of the flotation process, being the junior member of the firm of Sulman & Picard, whose name is attached to many patents, more particularly the one that has been the subject of so much litigation in this country. We like to think that if Mr. Picard had had the only say in the matter, the Minerals Separation company, with which his firm is so closely identified, would have adopted a less truculent policy. It is inconceivable that a technician capable of an outlook so scientific and philosophic, as that embodied in the presidential address, could have advocated the steps taken by the Minerals Separation company, in this country, to gag the profession. Whether we are right in our friendly surmise or not, the presidential address remains as a scholarly review bespeaking an intellectually generous mind and an accomplished metallurgist. What Mr. Picard says about the progress of the flotation process is highly interesting;

so are his remarks on the roasting of zinc ores and wet methods of extraction. He has kept in touch with American practice and is enabled thereby to present a comprehensive review of his subject. His references to the Delplace furnace, to the Cottrell and Halin processes, and to the Crowe method are to the point. We like what he says about the status of gold mining and the urgency for some measure of relief. In regard to secrecy in the art of metallurgy, and the paucity of information available concerning British methods, we venture to say—not without a smile—that Mr. Picard is throwing stones—and we approve of the throwing—from a domicile that looks to us very much like a conservatory. How much have he and his friends disclosed concerning the metallurgical methods in which they are especially versed? Evidently his admirable views on this matter are of an academic character and intended for non-domestic application. It is fair to note that he seems to be aware of the irony of his position, for he makes incidental mention of promised “contributions to the more scientific aspects of flotation.” Hurry up, Sir! Something of this kind was said five years ago by some of your friends. “Art is long and life is fleeting.” We note with considerable satisfaction that the advice given by Mr. Ingalls in a recent presidential address has greatly impressed his fellow-president in London, so we hope that even our less influential suggestions may impinge favorably upon Mr. Picard’s eminently receptive mind. We thank him for the courageous note with which the address ends; that is the spirit in which the War was won, and it is the spirit in which all good work is accomplished.

A PROPOS of our editorial on ‘The Engineer as a Citizen’ appearing on another page, we note that at the recent meeting of the American Society of Civil Engineers a report was submitted by the Committee on Development in the course of which sundry interesting recommendations were made. Among these was one embodying the local affiliation of the branches of the national technical societies and the local technical societies. In some degree this is being done already in San Francisco and Denver, for example, where joint meetings of members of all the technical societies are called on special occasions, as when a paper or address of special interest is to be presented. Next comes the suggestion to form a State Council composed of representatives from the local affiliations. This also has been done in California. For example, all the branches of engineering were represented in the steps taken to prevent the passage of an engineers licensing bill by the State legislature. We note also that “a short code of ethics of broad scope, general character, and positive rather than negative injunction, be prepared.” That will be useful and interesting. It is highly desirable that the professional morale be maintained and the ideals of the profession be encouraged at a time when so many professional men are tempted to engage in questionable business for the sake of making money easily. A standard form of licensing bill is recommended to be used in the framing of legislation.

If we must have a licensing law it will be well to have it uniform all over the country. The Committee finds that “the present practice with regard to expert testimony and arbitration is not satisfactory,” an expression of opinion with which most of us will agree, and it suggests the co-operation of a committee from the four founder societies with a committee of the American Bar Association in order to develop a better practice. Yes, indeed; it is high time that technical witnesses, now special advocates, were engaged by the Court itself, not by the litigants, although the cost of engaging them might still fall upon the latter, equally. Another recommendation looks to the co-ordination of the Government’s industrial activities under the direction of a Federal Department of Public Works. In this respect we are behind European practice; we load our Cabinet officers and Federal departments with an extraordinary medley of responsibilities; for example, the departments of War and of the Interior. The result is both extravagance and inefficiency in many directions, but not in all. We note, in conclusion, that, in accordance with similar action taken by the societies of mining, mechanical, and electrical engineers, it was decided to form a joint conference committee for the purpose of putting these ideas into effect.

DURING a mining dispute recently decided in Ontario, two interesting points were presented for adjudication by the Mining Commissioner, Mr. T. E. Godson. The first involved the legality of using old stakes for making a re-location. It appears that the ground had been staked many times previously and that the disputed location, of Mr. J. A. Knox, was made at night in order to obtain priority. The Commissioner said that he saw no distinction “between the re-marking of a post formerly used and the adoption, by the staker, of posts used by other holders, but upon abandoned claims.” The old posts had ceased to have any legal value “and their usefulness passed with abandonment or forfeiture. The posts would no longer be the property of the holder of the forfeited interest or cancelled claim, and remained only as the mute testimony of a disappointed licensee.” However, he considered the re-marking of such abandoned posts “a dangerous practice” and it behooved all licensees “to stake their claims so that possibility of attack upon the ground of defective staking is not left open.” Another legal point arose out of the fact that the re-locating was done on a Sunday. It was claimed that the staking by Mr. Knox was abortive because it was contrary to an Act of Upper Canada “to prevent the profanation of the Lord’s day” and an Act of the Dominion making it unlawful “for any person on the Lord’s day . . . to sell or offer for sale or purchase any goods . . . or to carry on or transact any business . . . or to employ any other person to do on that day any work, business, or labor.” The Commissioner decided that the prospector is not “a workman or laborer” in the sense of the first enactment and, as to the second, Mr. Knox made his discovery “without work or labor.” The discovery had been made already. A locator in

Ontario must comply with the Mining Act of that Province; he must perform his assessment work under that law; neither Sunday nor holidays are excluded; each day counts equally in the respective periods allowed for his assessment work. The ground became open for location after October 12, which was a Saturday. "The property was undoubtedly Crown lands," said the Commissioner, "and open for staking, and there was no prohibition in the license from the Crown restraining or prohibiting such an act on Sunday." He went further in his ruling, he considered the calling of the prospector and the consideration due to him by society. "A prospector," said he, "who separates himself from the comforts and protection of society, blazes a trail into unknown mineral zones and discovers mineral of value, is serving not only himself but the public at large, and no unnecessary restraint should be placed upon his activities." He could understand a prospector being forgetful of the day of the week; he could appreciate the necessity for haste when the grubstake was running low and the prospector was far from a source of supplies. We can understand these considerations also, and we regard the ruling as both sensible and humane. The Commissioner, however, does not encourage Sunday work, if avoidable. He said: "I confess a desire to abstain from finding that to stake a mining claim on Sunday creates an invalidity through the operation of the Lord's Day Act, and yet I wish to be understood that Sunday should be observed as a day of rest and calm when the mind can be dissociated from worldly tasks. Nature, however, has its own quieting influence and provides 'books in the running brooks, sermons in stones, and good in everything'." Yes, indeed; the prospector can, and often does, worship in the great cathedral, whose dome is the blue sky, whose aisles are of the forest, where the pines bend their heads in prayer and the winds of heaven make music for the listening ear.

Peace

It was the idea of peace rather than the terms of the treaty itself that gave joy to the world on June 28. The guns that boomed and the bells that pealed on Saturday last echoed the thankfulness of mankind that the long and cruel war was at an end legally. To most of us the event was a sad anti-climax, for seven months of growing impatience and disillusionment had elapsed since the joyous moment when in the darkness of a November night we had celebrated gratefully and enthusiastically the end of the fighting and the signing of the Armistice. Little then did we realize the difficulties and delays inseparable from the completion of the necessary negotiations; little did we comprehend the complexity of the international problems created by the disintegration of Europe. We realize and comprehend all that now, and it should increase, rather than decrease, our appreciation of the labors performed at Paris. We regret the absence of the Chinese delegates at the last ceremony and we feel some sympathy with General Smuts in his protest against the

Shantung settlement, of which President Wilson's enemies will make the most, but any fair-minded man will recognize the practical impossibility of adjusting a thousand and one conflicting claims without giving offence to one or more of the nations concerned. Most of all we regret the growing irritations expressed by the Allies and their Associate after the finish of their victorious campaign against German brutality. United against the foe in the height of conflict, they have failed to keep their tempers or to maintain their comradeship since the crisis has passed. One has boasted too much, another has been jealous, a third has been too grasping, a fourth has adopted a pose of selfish detachment—we do not describe any member of the group, but we instance the pose assumed by various ones in turn—until the splendid solidarity of the fighting days has given place to dissension on the very eve of the final settlement. If the world is to benefit from the peace we must change our mood and determine to work together generously, not only for the establishment of the League of Nations and the continued development of the idea expressed by the Covenant, but we must try earnestly to evoke a larger measure of international charity. We Americans are too provincial, almost as provincial as some of the others; much of the petty spirit shown today, even by the returning soldiers, is the result of that provincialism; we must take care lest the labor-unions develop a false internationalism—one based on class feeling—before we acquire one founded on a better basis. For the internationalism of the proletariat, which aims to destroy national spirit, we have no use whatever, believing that the best cosmopolite is he who loves his own country above and beyond all others; and the highest type of such patriotism is shown not by the ignorant or the unimaginative man but by him who knowing, respecting, and even loving other countries and other peoples, still loves his own country as a man loves his own mother. The treaty records the punishment of Germany and the fulfilment of the purpose that brought 26 nations into alliance against the unscrupulous effort to dominate first Europe and then the world. It is a warning to international piracy and to militarist ambition. We may see other wars in the days to come, but it is safe to predict that wars of conquest such as those of Frederick the Great, Napoleon I, and William II will never be allowed again to make headway. The League of Nations is imperfect necessarily, and it may not succeed in all its good intentions, but it is reasonable to expect that it will serve to check any further attempts at world domination. We think the President justified in speaking of the Treaty of Peace as "a charter for a new order of affairs in the world." Certainly it does "associate the free governments of the world of affairs in a permanent league in which they are pledged to use their united power to maintain peace by maintaining right and justice." It will not be smooth sailing; there will be squalls; but we have a chart now to help us in steering through darkness and storm, and if the ship's company will only try to restrain their natural impetuosity we may hope to reach smooth waters and keep on the course of human progress toward the distant haven

of a peaceful way of living. So we welcome the signing of the Treaty thankfully, and on this consummation of the national effort, and of the Allied effort, we rise in deep respect and profound gratitude to salute the heroic dead by whose valor our purpose has been achieved.

The Engineer as a Citizen

This was the subject of a symposium held recently in the Engineering Societies Building, at New York, under the auspices of the local sections of the four founder societies of engineers and of other technical organizations. Mr. Gano Dunn, an eloquent speaker, was chairman of the meeting. Mr. Philip N. Moore, who needs no introduction to our readers, took as his text 'The Responsibility of the Engineer' and started by saying that the engineer has awakened to the fact that he is "not politically potent," because he rarely serves politically nor has he usually developed the political sense. This is due in part to his migratory habits, themselves the consequence of short-lived engagements and discontinuous work over a field not limited either by county or State, nor even by national boundaries. Failing to make local ties or to assume local responsibilities, he has little sense of civic duty except spasmodically in times of crisis, such as in the War, when he rose to the occasion in an exemplary manner. Another adverse factor is found in loyalty to, or in discipline enforced by, big corporations, many of which have interests adverse to the public and therefore expect their engineers to keep out of politics. We agree with Mr. Moore, whom we are paraphrasing; it is noteworthy, for example, that the technical men employed by the big smelting consolidations show no more than a formal interest in the vexed questions of the hour. The talking is left largely to the heads of the organizations and they usually have little to say except when their pocket nerve is touched. Their juniors, the progressive technicians, are bound, by rule or etiquette, we do not know which, to a discreet silence. We venture to say that our profession has lost something of its character during the last two decades by reason of the fact that the big corporate mining and smelting enterprises have aggrandized themselves exceedingly and have tied the most capable members of the profession to themselves, making them a part of a business organization in which liberty of political action is difficult, if not altogether impracticable. The number of independent consulting engineers is small and most of them are not independent from choice. Again, the tradition that engineering societies must hold themselves aloof from political affairs—a view held strongly, for example, by Dr. Raymond—has discouraged participation in civic duties and in discussions upon public questions. On top of these checks and timidities the engineer is inarticulate publicly, because, with rare exceptions, he does not cultivate the ability either to write or to speak effectively, particularly the latter, which is essential to the exercise of influence upon one's fellows. That this entails a great loss to the community no thoughtful citi-

zen will deny, for the mental training and the varied experience of the engineering class, in the doing of things and in the directing of men, represent an asset of inestimable value to the commonwealth if applied to municipal, State, or national affairs. At a time when loose thinking is as dangerous as loose dynamite, at a time when a hysteria of political sentimentality is undermining the very foundations of representative government, it is more than regrettable—it is pathetic—that the engineer should not bring his disciplined mind to the service of society. During the War the need for joint action by the engineering societies became recognized, the result being the creation of the Engineering Council, which, since May 1917, has been able to express the best engineering opinion of the country on matters of administration and legislation at Washington. At the close of the War the Engineering Council appointed the National Service Committee, of which Mr. M. C. Leighton is chairman, to keep an eye on legislative measures affecting engineers and on matters of public welfare connected with engineering. This is a step in the right direction. Mr. Calvert Townley, of the Electrical Engineers, raised the question whether it would be possible for the engineers to be "a technical organization and a political party at the same time." Obviously "a united body of technical men" might, by political passion, become disintegrated unless guided sagaciously. The time may come when the technical institute as such will be distinguished from, and supplemented by, the larger organization intended to promote professional solidarity and co-operation. The movement toward a union of the existing societies and the evident tendency to form one national engineering organization is in large measure a result of war conditions and of the national spirit evoked during that stirring period. To the engineer as a citizen in a republic such a consolidation would give a political power he never had before, but it might tend to relegate purely technical subjects, now the principal topics at the periodic meetings, to a secondary place. Even that prospect should not appal, for a place will be found for technology at special meetings, and if we sacrifice something to good citizenship we shall be better engineers. We are inclined to agree with Messrs. Farley Osgood and J. E. Johnson, Jr., both of whom took part in the symposium, that the education of the modern engineer is so specialized that he misses the generous training of the humanities; he has no time for the study of his own language or of the classics, for history or philosophy, because he wants to give his time to the special studies that prepare him for the winning of a livelihood or the gaining of a fortune. He emerges a specialist, rather than a well educated man. In consequence, his mental scope is so narrow as to make him politically impotent. After all, there lies the trouble. As bends the twig so grows the tree. We sacrifice culture to bread and butter. We make an efficient specialist at the expense of an effective citizen. When we recognize that a good citizen is more valuable than any 'ologist, we may begin to produce him in larger numbers.

DISCUSSION

A Primitive Sun-Dial

The Editor:

Sir—On a recent professional trip through the mountains of northern Sinaloa in Mexico I came across the following curio at the home of one of the Indians. This man could neither read nor write and was of the typical type of Indian who inhabits that part of the country. He was by profession a wood-cutter, and I was much

surprised to find in his little yard a sun-dial, which I photographed. It consisted of a post set on an incline, from the top of which was nailed a bottom of what had once been a lard pail, and in the centre of this a long wire-nail was driven. Well-defined scratches on the circumference of the tin disc in connection with the shadow made by the nail indicated the time of day. You will note the shadow caused by the nail. The picture was taken at about a quarter past four by Mexican Federal time, and it was not so very far out when the proper corrections were applied.

I questioned the Indian whence he got his knowledge, and he stated that the method of determining the inclination of the post and the marking of the disc had been known in his family for "ages," as he expressed it. I tried to get him to describe this method of doing it, but I was no wiser at the end of his discourse than when he commenced. The fact remains that here is your sun-dial and it gets results, which, from an engineering standpoint, was interesting.

The Leaching of Flotation Concentrate

The Editor:

Sir—In reply to Mr. E. M. Hamilton's letter in your issue of June 21 on the above subject, I have pleasure in answering his questions in the order given.

(1) The tests at the Edwards metallurgical works were conducted with the object of determining the best methods of treatment. While percolation gave satisfactory results, the time required for the operation makes it advisable to use the Dorr system of counter-current decantation in a plant treating more than a few tons per day.

(2) I have proved by experiments that over 90% of the acid-soluble copper can be dissolved in a few seconds by adding hot calcine, as discharged from the furnace to the lixiviant. Therefore dissolving-tanks are not required preliminary to the Dorr counter-current system. This opinion is confirmed by Lawrence Addicks in the Transactions of the A. I. M. E., Vol. LII, 1915.

(3) I refer to the danger of incomplete washing of the pulp between copper extraction and cyanide treatment for gold and silver. I thought the fact that the final washing out of gold and silver can be successfully performed was sufficiently well known to prevent any misunderstanding when I referred to incomplete washing.

(4) If roasting is conducted under the most favorable conditions for copper extraction, the silver in the calcines will be in the form of the sulphate and metallic silver. In confirmation of this statement I quote 'Experimental Leaching at Anaconda', Transactions of the A. I. M. E., Vol. XLIX, 1914.

(5) The chlorination of residues from copper-leaching was successfully performed on a large scale at Mount Morgan, Queensland, by means of a solution of chlorine in water, the operation being conducted in large open tanks. I propose a modification of this process.

(6) The ores on which the experimental work was conducted did not contain sufficient silver to warrant extraction by a separate process, but a few experiments were conducted on the residue from chlorination and the greater part of the silver was found to be in the form of the chloride.

(7) The working-costs given for gold and silver extraction apply to chlorination followed by water and 'hypo' treatment. In the case of the gold both the extraction and costs were compiled from figures obtained in working-scale tests, but the figures for silver were assumed.

The extraction of the silver is the only step in the process that has not been thoroughly demonstrated, but in view of the results obtained at Anaconda by an oxidizing roast followed by an acid-brine leach, I cannot see that this is an unsurmountable difficulty.

I would like to point out that the experiments outlined in my article were conducted on concentrates from a number of Australian mines and not exclusively on Mount Lyell mill-products.

The Gwin Mine

The Editor:

Sir—I wish to correct an erroneous news-item that appeared in the June 14 issue of your valuable paper, relating to the Gwin mine. Evidently your correspondent did not know the facts concerning this great property.

The surface plant of the Gwin Mine Development Co. was sold more than a year ago, when machinery of all kinds was in great demand and brought war-time prices. The company deemed it good business to dispose of it, as much of it would have to be replaced with modern electrical equipment because it was worked out, as stated; it was a question of power conditions that closed the mine. Of this I will not go into details other than to say that it was most unfortunate for all concerned.

As to the conditions of the mine, the engineer's last report showed that the mine had developed more ore, and of a better grade, and looked more promising than it had for many years previous to closing down. There is developed in the bottom of the mine, ore-shoots of a combined length of over 450 ft. that show an average assay-value of more than \$10 per ton, and there are other hundreds of feet of ore that give assay-values up to \$5 per ton. These splendid orebodies are practically intact, as the mine when closed had not been placed in condition to extract this ore. In addition to these newly developed orebodies in the bottom of the mine, there is known to be a very large tonnage of ore available in the upper levels of the south shaft of the mine. Two-thirds of the mine has not been prospected and very little cross-cutting has been done. The contact with the greenstone was never reached on either the east or west side. All of the ore encountered was found in the slate. The Gwin mine has been as rich in places as any mine on the Mother Lode,

and has had as long chimneys of payable ore as any. One chimney was over 1600 ft. in length of continuous pay-ore averaging from 4 to 8 ft. thick. In other places the ore was over 20 ft. thick for many hundreds of feet.

About a million tons of ore was mined and milled by the present company. In addition to paying liberal dividends, the original cost of the mine, the cost of hundreds of acres of added territory purchased by the company, and the entire cost of the plant was paid for out of the profits of the mine. The Gwin has produced about \$5,500,000 in gold. The stock has been closely held and was never placed on the market. The mine owes not one cent to any investor, and it is safe to predict that when this splendid mine re-opens, as it will some day, it will give a good account of itself.

F. B. MOORS.

San Francisco, June 21.

Ptomaine, or Botulism

The Editor:

Sir—In your issue of June 14 you mention the death of 12 out of 36 guests at an Alaskan dinner and state the cause as ptomaine poisoning. It would be of great interest to know details of the food eaten and its condition. The danger from ptomaine poison is well known and is usually ascribed to spoiled meat or fish. It is not so well known that spoiled canned fruit or vegetables may be equally deadly. Botulism is the disease brought on by such spoiled canned fruit or vegetables; it occurs within a few hours or may be delayed as much as nine days. It is stated that this disease caused the Alaska deaths and not ptomaine. Great muscular fatigue, eyes affected even to blindness, diarrhoea, and nausea are among the symptoms. On the Pacific Coast ten cases were reported in the six months ended May 1918, and in all 19 cases have been recorded; death took place in two-thirds of these cases. In November 1913 out of 12 persons who ate string-bean salad at Stanford one died. At Fallbrook, five died after eating canned apricots. A woman and 40 chickens died at Hillsboro, Oregon, after eating canned corn. In Darmstadt, Germany, 11 died out of 21 persons who had eaten bean-salad. A peculiarity of the disease is that the mere tasting of canned food has caused death; a Miss B. of Ontario, Oregon, tasted a jar of canned string-beans and concluded that they were not "exactly right." She died in 52 hours.

The disease is due to toxins generated by the bacillus botulinus. Boiling the food from 15 to 30 minutes destroys the toxin and renders it harmless. The disease although rare is worth bearing in mind and whenever there is any doubt as to the goodness of canned food it should be boiled for 30 minutes.

W. H. SHOCKLEY.

Palo Alto, June 16.

Note: An intensive study of botulism is now in progress at the laboratory of experimental medicine at Stanford by Mrs. G. S. Burke, to whom I am indebted for the above information.

THE ROCHESTER COMBINED MILL, ROCHESTER, NEVADA

Ball and Tube-Mill Drives at the Rochester Combined Mill

By K. FREITAG

The grinding elements in the Rochester Combined Mines Co.'s mill at Rochester, Nevada, are arranged in two units, each composed of one 6 ft. by 4 ft. 6 in. ball-mill and one 7 by 12-ft. tube-mill.

The ball-mills are fed from two cylindrical bins by apron-feeders that discharge into the centre-fed scoop-feeders mounted on the feed-trunnions. The size of the ore particles fed to the ball-mills is $1\frac{1}{2}$ in. All the mills are of the overflow type employing no screens in the discharge end, but the trunnions are equipped with reverse-spiral liners. The ball-mills use forged-steel balls as a grinding medium, and the new balls fed through the central feed-opening are 5 in. The pebble-mills use flint, which is fed through the centre opening in the scoop in the same way as the balls. The ball-mill discharges its product to a duplex Dorr classifier operating in closed circuit with the pebble-mill, the pulp being ground so that 80% will pass a 200-mesh screen.

The feature of the equipment is the main-drive arrangement. Many designs of ball and tube mill-drives have been put into operation, and every known method of transmission has been employed, but nearly all have developed serious faults after a few months of continuous operation. From the early application of the long-belt drives to the later short-centre or Lenix drives, many variations of belt-drives have been applied. Of all belt-drives the long-centre straight drive has proved the best, but it requires considerable floor-space and is an obstruction where closed-circuit grinding is employed. All belt-drives involving a friction-clutch to reduce the starting torque introduce an accessory that is weak mechanically, as the strain on the clutch is extremely heavy when starting the mill from rest, even if rocking the mill is attempted.

With the introduction of closed-circuit grinding it was necessary to develop a short-centre drive. The first tried

was a double-gear reduction, using a friction-clutch and constant-speed motor. Later, a chain-belt was used in place of the first-gear reduction, and finally, a single-gear reduction by means of herringbone gears. All these drives were objectionable either in the methods of application or under-rating the excessive strain on them; but the main trouble was that due consideration was not given to the end-surge which occurs in all ball and tube-mills, no matter how well they may be balanced. The bearings cannot be set close to the trunnion-collars, as clearance must be allowed for contraction and expansion

PLAN OF BALL-MILL DRIVE

of the mill-barrels. This is particularly the case with the longer tube-mills, in which the grinding temperature varies. In shorter mills, where it is possible to set a new mill with only slight clearance, the wear and tear of daily use will soon be noticeable.

It can be seen readily that this end-surge will seriously affect direct or single reduction gearing. The speed of the driving-shaft prevents it from following the jerky surge of the mill, and therefore causes excessive side wear on the driving-sprockets. In order to overcome the objectionable features embodied in the drives mentioned it was decided to eliminate them in order as they occurred. That this was accomplished has been demon-

strated by the continued successful operation of the mills during the past year.

In the illustration it will be noted that the general design is identical for both ball and tube-mills. In order to secure interchangeability of parts, it was decided to build both mills as nearly alike as was possible, although the diameters were different. All trunnions and trunnion-bearings were made 24 in. diam. by 24 in. long, giving an extra large bearing-area and also providing large trunnion-openings. The trunnion-liners were made interchangeable as well as the feeders and discharge-spouts. This idea of interchangeability of parts was carried through to the motors and the entire drive arrangement. The motors were built on the same frame, thereby making all bearing-shells interchangeable. The switchboard and control apparatus were made identical with the exception, of course, of the grid-resistance.

The selection of motors to take full advantage of the desirable features of the drive was carefully investigated and it was determined finally to use motors of the Westinghouse CW type. These are phase-wound motors designed especially for good starting characteristics and high running efficiency with windings carefully braced to resist the vibrations incident to tube and ball mill-drive. A further advantage was that the Westinghouse company could supply motors of 75 and 100 hp. for the ball and tube mill-drives, respectively, built on the same frame so that all mechanical parts would be interchangeable. The ball-mills are driven by 75 hp. 585 r.p.m. 440 volt, three-phase, 60-cycle type CW motors and the tube-mills by 100 hp. motors of the same characteristics. Each motor is provided with a control panel of the Westinghouse type RF, style No. 245,374, equipped with suitable starting resistance. These RF panels are supplied with an ammeter, a primary circuit-breaker with overload trip and under-voltage release, as well as a drum-controller behind the board with a hand-wheel mounted on the face of the panel. The ammeters enable the operator to know at all times just what his mills are doing, and he is accordingly able to adjust his ball charge to get the best results. The RF control-panel has a special feature in that the operating mechanism of the motor starting-controller is interlocked mechanically with the primary circuit-breaker so that if the circuit-breaker has once tripped it cannot be closed again until the controller has been returned to the 'off' position.

On each motor-shaft is mounted a 24-in. Nordberg flexible coupling connecting the motor to a short shaft that carries the driving-sprocket for the chain-drive. This shaft is of the same diameter as the motor-shaft and is mounted in two rigid pedestal bearings supplied with ring-oiling removable bearing-sleeves interchangeable with the motor-bearings. These pedestals were furnished by the Westinghouse company. A heavy cast-iron sole-plate forms the base for the above bearings as well as for the main counter-shaft bearings, and as all bearings are provided with means for lateral adjustment, it forms a rigid base on which it is possible to maintain perfect alignment for the chain-belts.

The driving sprockets and chains for the ball-mills are as follows:

75 hp., 48-in. centres, reduction 585 to 160 r.p.m.

Driver-sprocket 21 toph, $9\frac{1}{4}$ in. face, 10.02 in. diam., hardened steel.

Driven sprocket 77 tooth, $9\frac{1}{4}$ face, 37.03 in. diameter.

Chain, Morse type, 14.5 ft. long and 9 in. wide, 1.5 in. pitch.

The driving-sprockets and chains for the tube-mills are as follows:

100 hp., 50 in. centres, reduction 585 to 138.5 r.p.m.

Driver-sprocket 21 tooth, $12\frac{1}{4}$ in. face, 10.02 in. diam., hardened steel.

Driven-sprocket 89 tooth, $12\frac{1}{4}$ in. face, 42.75 in. diameter.

Chain, Morse type, 15.75 ft. long and 12 in. wide, 1.5 in. pitch.

Both of the above drives are enclosed in a galvanized iron case provided with hand-hole and oil-drip rings.

The main countershafts for the ball and tube-mills are $5\frac{1}{8}$ in. diam. mounted in heavy mill-type ring-oiling bearings. The two bearings next to the main pinion are mounted on a heavy cast-iron sole-plate which is tied to the main trunnion-bearing at the discharge end of the mills, ensuring perfect alignment of the main drive. The other end of the shaft, on which is mounted the driven sprocket, is carried in heavy ring-oiling bearings, similar to those on main-drive end, and mounted on the sole-plate, which also supports the bearings carrying the motor-shaft extension.

The main drives for the ball-mills are as follows:

Driving pinion cut cast-steel, 15 teeth, $3\frac{1}{2}$ in. pitch, 14 in. face.

Driven gear close-grained cut semi-steel, 100 teeth, 4 in. pitch, 14 in. face.

Main drives for tube-mills are as follows:

Driving pinion cut cast-steel, 16 teeth, 4 in. pitch, 14 in. face.

Driven gear close-grained cut semi-steel, 100 teeth, 4 in. pitch, 14 in. face.

Both main-driving gears are made in halves and bolted to the end flanges of the mills in such a way that they can be easily removed or turned around, so that both faces of the teeth can be used. The speed of the 6-ft. ball-mills is 24 r.p.m. and of the 7-ft. tube-mills, 22 r.p.m.

This drive arrangement with all bearings mounted on interconnected sole-plates ensures perfect alignment of all the shafts. The employment of cut spur-gears, chain-drives, flexible couplings, and slip-ring motors is considered by the designers to be superior to any other drive arrangement for ball and tube-mills. The chains are relieved of all excessive strains and run perfectly, without the customary jerk so familiar in the old type of drives. Any undue strain or surge of the mills that is not absorbed by the cut main spur-gears and is transmitted to the chain-sprockets, due to slightly worn collars on the main shaft, does not affect the running of the chains; as this motion is not counter-acted by the motor, but is absorbed by the flexible Nordberg coupling connecting the motor with the floating motor-extension shaft.

Institution of Mining and Metallurgy, London

PRESIDENTIAL ADDRESS, BY HUGH K. PICARD

INTRODUCTION. In addressing you tonight I propose to follow the course taken by my predecessors in giving a brief survey of recent metallurgical progress, in so far as such has come within the purview of my particular work, concluding with some remarks of a more general character on matters affecting our industry. In normal times it would be a simpler task to follow and record such developments, but the War has imposed entirely new conditions which increase the difficulty of a review, such as secrecy (in order to prevent leakage of information to the Enemy), urgency (wherein economics have been thrown to the winds in the materialization of a desired military result), an entire re-grouping of the factors of chemical and metallurgical supply and demand, and, finally, the promise of revolutionary changes in regard to labor.

As to the first of these it is to be hoped that, as the necessity for secrecy no longer exists, many of the great advances in technical and metallurgical science evolved under the stimulus of war may now become known for the early benefit of our national industries.

Further, it is much to be desired that such industries as have sprung up in response to our urgent necessities (other than those concerned with the production of purely war material) will not only be retained by us, but will continue to develop to the advantage of the country and the nation. Certain of these have been re-created in an artificial atmosphere of State support or subsidy; several, with such assistance, having reached a stage of technical efficiency, it appears to be of vital importance that further encouragement should be afforded them for such periods as will secure their permanence or of their requiring a minimum of external support.

TUNGSTEN. A typical example of this is the tungsten industry, about which so much has been made public. Even the non-technical reader is now familiar with the general facts regarding this metal, while a certain amount of information as to its production has also become known through the technical press. It will be sufficient for me to refer to Julius L. F. Vogel and A. F. MacLaren, whose able work resulted in the production of this essential metal—essential not only in war, when its supply was a vital necessity to the country, but also in time of peace. Its importance is well expressed by the American metallurgist, Colin Fink, who says: "It may some day be said that tungsten made democracy possible." Through the efforts of these metallurgists and their associates we are now independent of foreign supplies and, moreover, the quality of the British production is superior to that previously imported from Germany.

FLOTATION. In regard to recent metallurgical advance

during the past few years it will probably be conceded that the practice of flotation has brought about greater progress in metallurgy than any other single invention. At the inception of the froth-flotation process in 1905, oils, such as oleic acid (then deemed to be insoluble), were used. As careful analysis showed the mineral so frothed to be intimately associated with the insoluble oil employed, the impression was gained that this had uniformly coated the particles which had been floated, and that the air-bubbles had become attached to such oiled particles. As the amount of oils used was relatively minute, say 2 lb. to the ton of ore, while the aggregate surface of the particles oiled is enormous, calculation showed it to be questionable whether an oil could be distributed *qua* 'oil' in such extreme tenuity and still retain its original physical properties.

With the discovery, some four years later, that other and wholly-soluble frothing-agents were found equally and sometimes even more efficacious, the conception that oil was primarily essential to frothing was necessarily modified, and the process became more widely known as that of 'froth-flotation'. With later discoveries as to the partial solubility of essential oils, of the beneficial effect of certain insoluble oils in 'stabilizing' the froths and of sub-aeration procedure, the elimination of any need for pulp-heating, or in many cases for acidification, together with the use of alkaline circuits, etc., modern flotation has made remarkable advances.

Broadly speaking, the essential conditions for effective flotation appear to be that the material to be floated must be capable of flocculation, while that not to be floated must be brought as nearly as possible to the reverse state. This is achieved by the addition to the ore-pulp of reagents which by adsorption or sorption at the surfaces of the various particles increase such differentiation. Acids, alkalis, and certain alkaline salts act in the direction of wetting the gangue by water more profoundly, producing a deflocculation effect, whereas the adsorption or sorption of a minute amount of an immiscible oil at the mineral surface renders this still less capable of being wetted by water, and thus stabilizes a mineral-coated bubble in water.

The water-soluble portion of an oil, or a water-soluble substance such as cresol, amyl alcohol, etc., reduces the tension of water, and thus permits the latter to form an extended froth surface for occupation by the less water-wetted floatable mineral. Certain oils may thus pay a dual part in flotation. Variations in ore constitution—both physical and chemical, in the nature of the water, in choice or limitation of reagent, and in local conditions generally—are so wide that each one will present a flota-

tion problem of its own, requiring individual study. Where the factors are so varied flotation must in large degree remain an art, as well as a growing science. This condition, however, governs applied science generally, and metallurgical processes form no exception to the rule.

I understand that contributions to the more scientific aspects of flotation may be expected shortly, which will, no doubt, go far to elucidate the fundamental principles on which the process is based.

Since the outbreak of war flotation methods have been widely, indeed almost universally, adopted. During this period, the greatly extended use of this process in the United States is the most notable feature, and it is hardly too much to say that concentration practice has been revolutionized; in addition to the increased recoveries of mineral due to the ability of this method to deal effectively with slime, its adoption has led to a general simplification of concentration procedure, with a corresponding reduction of working cost.

In modern installations, such as that of the Inspiration Consolidated Copper Co., at Miami, Arizona, where the plant was specially designed for flotation, the current practice is to limit the units to the smallest number possible. At this mill the ore, first crushed by disc-crushers, is passed to tube-mills, working in closed circuits; the pulp is then immediately sent to flotation units with the consequent elimination of all intermediary steps in the concentration. The re-treatment of any middling products and the enrichment of the primary concentrates is also effected by flotation, resulting in a simple flow-sheet.

Froth-flotation has developed the use of settlers and vacuum-filters, which are now indispensable units in concentration plants adopting this process. The settlers are in some instances employed for the re-utilization of plant-water, and in others for the thickening of concentrate prior to vacuum-filtration; their usual size is from 30 to 50 ft. in diameter, but in some instances settlers of over 200 ft. in diameter are in use. The shallow 'tray' settler is also employed where the physical character of the ore permits; these consist of units 3 to 4 ft. in depth superimposed on a common shaft to economize space and secure increased capacity.

Similar progress has marked the evolution of the flotation-units themselves. In the Minerals Separation type, for example, the driving gears have in some instances run continuously for over three years. These units are self-regulating, the supply of reagents being automatic, so that in practice it is not uncommon to find one man per shift operating units dealing with between 3000 and 4000 tons of ore per 24 hours.

Everywhere the tendency is toward the elimination of hand-labor; thus, besides ore, the concentrate and tailing are handled by settlers and belt-conveyors, whereas the grouping of all units is designed with the object of reducing labor, space, and construction cost to a minimum. The result has been a reduction in cost which, in many instances, has rendered obsolete the best of the older gravity concentration systems.

Some comparative figures as to the advantages of flotation may be of interest. The total tonnage of ore treated by water concentration at the Anaconda plant from February 1902, to December 1915, was approximately 36,000,000 tons, carrying 1,250,000 tons of copper, of which the actual recovery was approximately 900,000 tons. In 1916, flotation was installed, from the results of which it is estimated that had it been used during the earlier period 175,000 additional tons of copper would have been saved, capable of realizing, less cost of treatment, a further profit of nearly £8,000,000. In 1913, when water or gravity concentration had attained perhaps its high-water mark of efficiency, the five largest disseminated copper mines in the United States produced approximately 162,000 tons of copper, but discarded about 83,000 tons in tailing, the average recovery of copper at these mines being about 66%; had flotation been employed it is now demonstrable that their increased recovery for that year alone would have exceeded £3,500,000. In its turn, however, flotation has introduced new smelting problems, mainly due to the fineness of the material to be handled; the International smelter, at Miami, which now represents the latest copper-smelting practice in America, has been specially designed to deal with this type of concentrate. Hand-labor here has also been practically superseded by mechanical appliances; specially designed cars handle the concentrate and facilitate loading and unloading, prior to its passage to the roasting-plant. The roasters are fired either by oil, or coal-dust, the latter having now proved the more economical; the Cottrell process here becomes a necessary adjunct, preventing dust losses with practical completeness. Again, progress in one department of metallurgy has imposed conditions which have led to improvement in another, thus the cost of smelting the fine concentrate, originally so difficult to handle, is now reduced to between 5 and 6 shillings [\$1.25 to \$1.50] per ton of charge.

Though the theoretical principles underlying flotation are still unsolved, progress in this direction is being made and it is one of the most remarkable features of this process that its use has been so greatly extended while its full scientific basis is yet unestablished. Callow, whose contribution to the technique of the art deserves special mention, calculates that with four different oils, three oil-percentages, two pulp-densities, and two changes of temperature, the possible commutations are no less than 59,284. This gives some idea of the difficulty experienced in arriving at the effect of any given change of conditions, but in spite of this over 400 flotation plants have been installed on the North American continent alone.

ZINC. Passing to the metallurgy of zinc there has not been any marked improvement of first importance in smelting during recent years, though general advance in matters of detail may be recorded. The problem of the mechanical roasting of the ores cannot yet be considered as completely solved, especially for the more refractory type, such as Broken Hill concentrate, which forms so large a proportion of the world's supply of raw material.

Though improvement has been effected in this direction, as exemplified by the Ridge and Spirlet furnaces, it is significant that in the latest zinc works to be erected in this country, the management have adopted the hand-rabbled Delplace furnace as being the type best suited to their requirements. These works, situated at Avonmouth, are being constructed by the National Smelting Co., and are designed for an ultimate output of 50,000 tons of zinc per annum. These, when completed, with extensions of other existing works, should go far toward establishing the industry in this country on a much sounder basis than existed before the War. No effort is being spared to make the Avonmouth works thoroughly efficient and up-to-date. The general arrangement is well designed, and provision is made for future extensions. The pottery has a capacity of 45,000 retorts, and is arranged for convenient handling in and out; two hydraulic pot-presses are to be installed (one of which is already erected), which will supply the retorts for the 16 retort-furnaces contemplated. These are of modern gas-fired type, the retorts being arranged in four rows, back-to-back. The air is pre-heated in regenerative chambers under the furnaces, and are protected from injury due to slag from broken pots by the interposition of a layer of chrome-iron ore between the regenerators and the retort-chamber. Five gas-producers are provided for each pair of furnaces, two being in regular use for each furnace, the fifth being a spare one which can be turned on to either furnace as may be required.

Though Delplace furnaces are being installed for roasting, the management is erecting one of special design, upon the results of which future additions will depend. The former are of large type, having six muffle-hearths each with 18 sections, and should be capable of dealing with 20 tons of raw concentrate per day. Special care has been taken in the design to ensure easy renewal of the hearth as required.

The acid plant, of platinum 'contact' type, was originally built by the Government, and has been used for the manufacture of sulphuric acid from Sicilian sulphur. With the necessary additions for cleaning the roaster gases from arsenic, etc., this plant will be available to deal with the sulphur di-oxide evolved from the 20 roasting-furnaces it is proposed to erect.

In view of the present high cost both of labor and material and the improved extraction now called for, much attention has lately been given to the question of treating retort-residues for their metallic contents, both as to still contained zinc, and other metals such as lead and silver, if present. It has been proposed to blow such residues on Wetherill grates, but this yields a mixed product of zinc oxide and lead sulphate and affords only an incomplete elimination of the silver. Other objections are the inferior quality of the product (due to a certain amount of fine grit being carried over with the fume), while if silver be present the blown fume acquires a pinkish tint, rendering it unsuitable for paint purposes; further, the silver, both in the fume and the ultimate residues, is lost. In the absence of silver, a market exists

for the zinc oxide-lead sulphate product, if free from grit and carrying about 20% of lead; such a mixture makes a paint of covering power superior to pure zinc-white, besides being cheaper. For ores of a less complex character, 'blowing' the residue offers fair possibilities, and it has even been proposed to modify the usual distilling practice in the direction of only recovering the more easily distilled portion of the zinc, calling for the employment of a smaller amount of reducing coal and leaving a richer zinc-residue for blowing. Such a procedure would increase the capacity of the distilling-furnace and result in longer life of retorts, as they would not require to be submitted to the high final temperature necessary to drive off the last units of zinc.

WET PROCESSES for zinc extraction with the subsequent recovery of the metal by electrolysis have now become firmly established; Ashcroft's pioneer work in this direction will be remembered. The conditions necessary for success, notably roasting at a low temperature to avoid the formation of insoluble ferrite, and the subsequent perfect purification of the solution are now well understood, the latter condition being demanded by the necessity for keeping the deposited zinc in a passive state to prevent re-solution. As a necessary consequence electrolytic zinc will always be highly pure compared even with the re-distilled zinc producible from retorted metal. Much discussion has taken place as to the possibility of the electrolytic process displacing the older method; but it seems probable that for some years to come both processes will survive, and that local conditions with regard to nature of ore, power-cost and facilities, etc., will determine which method shall be adopted for any particular case. It may be said for the electrolytic process that it certainly permits the utilization of low-grade and complex zinc ores which could never be available to the retort process. As an example, the Consolidated Mining & Smelting Co. is treating ores by this method at Trail that assay as low as 20% zinc and carry 14% of lead. Further, combination dry-and-wet processes are likely to develop wherein the zinc oxide (and lead if present) are concentrated as a 'fume' for subsequent treatment by solution of the zinc followed by electrolysis. Such methods have the advantage of yielding a zinc solution requiring the minimum of purification, while leaving other metallic contents in a form recoverable by smelting.

At Anaconda, Laist has proceeded in a reverse direction, by first extracting roasted flotation concentrate with acid, electrolyzing the purified solution, and treating the residue by volatilization in a reverberatory furnace, the contained zinc being recovered as oxide. According to recently published information, Laist no longer recovers the zinc by volatilization, confining this operation to the saving of the lead, while the zinc passes into the slag. How far this is due to more perfect original extraction of the zinc in solution in the previous operation is not stated.

These developments are due in large degree to the work of American metallurgists, who have at their dis-

posals large supplies of ores of varying character offering scope and opportunity for special methods of treatment. But in this country also zinc has been regularly produced by electrolysis from ores, though on a smaller scale; given, however, equal opportunity we may certainly claim to possess the necessary technical knowledge to compete with foreign producers.

The War brought about a large demand not only for the highly-pure electrolytic zinc of 99.95% grade, but also for metal of 99.9% purity obtainable by the re-distillation of ordinary brands, and even of 'hard' spelter, which contains about 90-92% zinc, the remainder being mainly iron. The method chiefly adopted in this country was devised by Fricker, who distills the metal in vertical closed crucibles provided with connecting pipes leading into a brick condensing-chamber common to a number of pots, generally eight. The lead and other impurities are prevented from passing over with the zinc-vapor by covering the surface of the molten metal with a floating filter of crushed coke, or similar porous material. By this process large quantities of refined metal have been produced for cartridge-brass and other purposes. How far the demand for high-grade zinc will persist for ordinary commercial uses is uncertain. For most alloys containing a substantial percentage of zinc, as also for galvanizing, ordinary brands of spelter are sufficiently pure; hence consumers are not likely to pay the higher price demanded for 'purity' metal.* The latter will therefore have to compete with G.O.B., and producers may perhaps be forced to accept a price only greater in proportion to the higher unit of the purer product.

ZINC OXIDE. Before leaving the subject of zinc metallurgy, reference may be made to the manufacture of zinc oxide in this country. Before the War practically the whole of our requirements were met from Continental and American sources; indeed, our secondary products were in some cases bought by German firms, exported to the Continent for treatment, and the zinc-oxide produce again sold to us. War conditions have since brought about the establishment of a domestic zinc-oxide industry; and, as in other cases, we now produce this material of a quality equal in all respects to that hitherto imported. Works capable of producing 50 tons or more per week are running regularly, and, given reasonable protection against unfair competition, there seems no reason why the whole of our requirements should not henceforward be met from domestic sources.

The oxide is manufactured by distillation of hard spelter, scrap, etc., with subsequent burning of the volatilized metal to oxide, which is collected in bag-house plant in the usual way. Technical details as to pipe arrangements, fan-capacities, etc., have been worked out, and the conditions necessary for the production of the highest quality product have been established. No doubt there will still be competition from American oxide, produced directly from ore, owing to the lower cost of the

raw material employed. This oxide, though of inferior color, is suitable for many purposes, such as rubber filling; moreover, it possesses the advantage of high density. Oxide production from ores and residues though not yet established in this country is being investigated, and there is reason to anticipate that this may eventually prove successful.

In South Wales zinc-dust ('zinc blue') has recently been manufactured direct from metallic scrap and a product obtained which is far superior to that derived as a by-product from the retort process; the latter usually contains about 85% of active zinc, whereas the former carries not less than 95%. The demand for high-grade zinc-dust in the dyeing industry is large, and, owing to its superior reducing value, it should have a good outlet in gold-precipitation.

The prepared fume is screened in a flour-miller's bolting machine; owing to its granular character no difficulty is experienced in screening. The product though excessively fine is uniform in size of particle and free from dust; under the microscope each grain is seen as a brilliant metallic sphere. A word may be said as to the perfection of the bolting machine for screening fine powders; this has been developed to meet the stringent requirements of the corn-milling industry and if better known would no doubt find application in screening dry crushed ore.

A wider general knowledge of the practice of industries other than our own would, I believe, lead to the discovery of many appliances which could be adapted to our special needs. For example, the filter-press was well known to the potter before its value was recognized in ore treatment. He has, from our point of view, the worst possible type of clayey material to filter and in addition contamination by iron rust must be avoided; hence he adopts a press with wooden frames. We could perhaps reciprocate by introducing to him the vacuum-filter and pulp-thickeners.

POTTERY. While on the subject of pottery an interesting application of gold may be referred to, though this perhaps comes rather within the province of chemical industry than metallurgy. It is not commonly recognized that the gold decoration of cheap pottery consumes a large amount of the metal in such a manner that it never returns to the market. The gold-line decoration on cheap cups and the 'solid' gold handles on cheap 'ornamental' vases is in fact gold of almost the highest degree of fineness employed in the arts. The compound as employed consists of an organic salt of gold in an oily medium, and as applied does not contain more than about 6-9% of metal. The desired decoration is painted on the otherwise finished ware, which is then heated to about 700°C., far below the melting-point of gold. Over 90% of the compound, consisting of the oils and medium, is thus burnt away, leaving the perfectly uniform coherent film of gold with which we are all familiar. The metallic components consist essentially of pure gold, but modified to the extent of about 1% with other metals, which brings about the brilliant metallic film; and it is

*The galvanizer would prefer pure zinc if obtainable at a reasonable price, as a more durable product results from its use.

interesting to remark that if absolutely pure gold be employed no such film would result, the effect being instead a dull earthy pink deposit. This affords another example of the influences of a small amount of a foreign metal on the mass, a feature so frequently met with in almost every branch of metallurgy. So coherent is the film, in spite of the loss of over 90% of the original compound, that it may be used as a satisfactory base for electro-deposition thereon of another metal, such as silver, for decoration or other purposes. Platinum behaves in a similar manner, and it is possible that for certain purposes porcelain dishes coated with gold or platinum by this means may be of service in the laboratory.

As another illustration of borrowing from other industries, the metallurgical furnace-builder may derive much assistance from the glass industry and *vice versa*. Oil-firing, now so commonly employed in smelting, is well known to the glass-maker, who may have experience in its use not generally known to the metallurgist. My object in the above remarks is to call attention to the advantages which must result from a freer interchange of knowledge and experience between our various industries. To this end one of our leading societies, the Society of Chemical Industry, has in normal times an annual program of visits to various works, giving members the opportunity of inspecting operations in which they are not directly interested.

COPPER. For developments in the metallurgy of copper we naturally look to the United States. Thanks to the publicity given to progress in the States and to their excellent technical publications, we have been made familiar with recent advances and it thus becomes unnecessary to refer to them in detail. Among such, reverberatory practice (due to the ever-increasing amount of flotation concentrate to be smelted) may be mentioned. In this connection the increased throat-area, with correspondingly larger burners for oil or coal-dust firing resulting in largely increased output per furnace, should be noted. The El Paso 130-ft. furnaces burning oil have reached a daily capacity of over 960 tons with a consumption of 0.61 barrel of oil per ton. Leaching of oxidized copper ores by ammonia, so often suggested in the past, has come within the domain of practical metallurgy. For example, it is reported that the Calumet & Hecla Mining Co., in a plant treating 2000 tons of tailing per day, is recovering copper at a total cost of 6.25 cents per pound, with a loss of only one pound of ammonia per ton of ore. Further developments have also taken place in acid-leaching plants in connection with which A. W. Halin's process deserves mention. He passes the acid solution through a number of ore-charges until the solution becomes neutral. It is then delivered to a tank containing fresh ore whereby the ferric iron is precipitated, whence, after acidification, the solution passes to the electrolyzing plant for precipitating the copper. The treatment of ore in heaps by leaching, following Rio Tinto practice, is also being extended in America.

In this country the industry cannot be said to be

flourishing, though in spite of war conditions, and partly because of them, some notable achievements have been effected. One instance of overcoming a serious difficulty may be cited, as showing the adaptability and resourcefulness of our metallurgists. In this case the ores to be smelted demanded the addition of pyrite, hitherto imported from Spain. Owing to the requirements of the Government for Spanish pyrite for acid-making this source of supply was cut off, threatening the closing down of the smelting operations. A new and hitherto neglected supply was, however, developed by the manager (one of our members) from the pyrite seams of the Welsh collieries, and it is satisfactory to record that this source now meets all the requirements of the works, not only for sulphur, but when calcined it is available as iron flux for smelting oxidized ores. The neglect to make use of this supply in the past is no doubt due to the reluctance of colliery proprietors to admit the existence of sulphur in their mines, as it might reflect on the quality of the coal. However, they now recognize that they have in pyrite an asset of value; moreover, it now pays to mine coal-seams rich in pyrite that hitherto have been left. The pyrite is recovered by hand-picking on belts. In the result the copper-works now secure ample supplies at a cost considerably below that previously paid for Spanish mineral; it is strange that this material has been overlooked by acid-makers in spite of the great demand created by the War.

As producers of copper we can, of course, never expect to compete with the United States, but, given a measure of State assistance, we ought to be in a position to secure for treatment a fair share of ores and matte from our own Dominions. For this purpose increased electrolytic refining capacity is certainly needed, but until some security for the industry be assured there is no inducement to capital to embark in such undertakings. The ever-growing demands of labor, with consequent increase in the price of raw materials, unless checked, must inevitably tend to drive the industry to countries where easier conditions prevail. The recent heavy fall in the price of the metal due to over-production, and the withdrawal of consumption for war purposes, calls for economy in every direction; it also points to the necessity for State action, failing which it is difficult to see how the industry can survive.

THE METALLURGY OF GOLD, in so far as it relates to the recovery of the metal from its ores, shows general improvement, but nothing of first-rate importance except perhaps Crowe's method of precipitating cyanide solution under reduced pressure. He shows that the air dissolved in the solution, has, owing to the different coefficients of absorption, a composition of 35% of oxygen and 65% of nitrogen, and consequently is a more active oxidizing agent than air of normal composition. He points out that in weak cyanide solutions, consequently with a minimum of hydrogen being generated, the oxidizing action of the dissolved oxygen largely neutralizes the reducing action and may even overcome it. In normal practice this is met by adding lump cyanide at the head

of the precipitation box, with consequent increased consumption of both cyanide and zinc. By the adoption of the vacuum process this practice is unnecessary and extraction may be effected with weaker solutions resulting in savings in all departments, including the production of a purer bullion. The Portland Gold Mining Co. reports a saving of \$30,000 per year in zinc and cyanide in a plant treating 2000 tons of ore per day. It is interesting to note that G. T. Hansen claims similar advantages by heating the solutions to 170°F. before precipitation.

Concentration of gold ores by flotation is making progress, but the field for this process is somewhat restricted, owing to the general high efficiency of the older methods. At Cobalt flotation has replaced gravity concentration, although at the Nipissing mine this process has been rejected, not on account of its inefficiency, but because of the difficulties in subsequent treatment of the concentrates. On complex gold-silver concentrate involving further treatment, the advantages of flotation compared with ordinary concentration followed by cyanide are not so manifest. The value of flotation as a means of increasing the world's output of gold lies rather in improved recovery of base metals, such as copper, with which gold is so commonly associated.

With reference to the production of gold, and more particularly to the question of a bounty, this is a matter for settlement between the economist and the producer. It is a subject upon which so many varying opinions have been expressed by authorities that it is difficult to arrive at any decided conclusion. So far as our own direct interests are concerned, a bounty on gold would be an obvious benefit, as we have many members engaged in this industry, though the objections to this course are also weighty.

A committee of the council of the Institution appointed to report on the position of the gold output of the British empire made an exhaustive inquiry into the subject, and issued their report in March 1918. This shows that a reduction of 20% of the Empire's gold production is visibly imminent, and this at a time when the need for gold is ever more pressing.* There can be no two opinions as to the vital importance of not only maintaining but also increasing our gold supplies, and with the object of effecting this the committee recommend a 10% bounty on the output of all struggling mines or alternatively a bounty of two shillings [48c.] per ton of ore treated. Proposals on these lines, however, were not acceptable to the Government Gold Production Committee.

It seems self-evident that unless relief in some form be granted, the production of gold must necessarily fall

by the stoppage of the lower-grade mines; apart from the influence this would have on the general economic position, as to which opinions vary, a serious injury would be done to gold mining as an industry. Lord Inchcape's committee, however, is not disturbed by the prospective stoppage of these mines, and does not consider such an eventuality to be of any great importance to national interests.† Although there may be objections or difficulties in the granting of a direct bounty it would not appear impossible to concede some remission of taxation, and to this extent relieve the industry of some of its unfair burden. We already have a precedent for such action; children are considered to constitute a valuable asset to the State, and in principle, though to a very slight extent, taxation relief is granted to the producer. Why, therefore, should not similar action be taken in regard to gold?

LEAD. In the metallurgy of lead, also, recent advances seem to be in detail rather than in fundamental improvements. In the stress of recent years there has been small opportunity of developing new processes in industries that are well established on recognized lines, such efforts being rather devoted to specialties called for by the War. Mention, however, may be made to progress in hydrometallurgy, as applied to oxidized lead ores. This has been limited to brine treatment with or without the addition of sulphuric acid to carbonate and sulphate ores. This process has been tested in America as well as in North Wales, where a small plant was working until the difficulties of obtaining supplies caused a temporary cessation of operations. In this case the material to be treated consisted of an extensive dump of blende and lead sulphate slimes. Vanner concentration yields a mixed product of no value until further separated. This is effected by agitating the concentrates with hot saturated brine at 70°C., whereby the lead sulphate is completely dissolved, with, of course, the equivalent formation of sodium sulphate. The presence of this salt in growing proportions interferes with the solubility of the lead sulphate, and must therefore be removed by the addition of the equivalent amount of calcium chloride. The lead solution is filtered from the blende-calcium sulphate residues, and precipitated with slaked lime, reforming a portion of calcium chloride; about 50% of the chloride is regenerated, the balance of the chlorine being precipitated with the lead as oxy-chloride. The blende-calcium sulphate residues are then re-treated on a vanner, which effects perfect separation of the easily removed flocculent sulphate, leaving a saleable blende concentrate. The chief objection to the process lies in the chloride present in the lead precipitate involving volatilization loss in smelting, but this may be overcome by precipitating the lead by electrolysis, using soluble iron

*The accuracy of this forecast is shown by a recent question in the House of Commons in which the Chancellor of the Exchequer was asked if he was aware that there had been a drop in the gold production of the British Empire of 13½% in the year 1918, compared with 1915, and that the world's production showed a drop of 20% in the same period. The figures given were not questioned.

†Since these words were written the Chancellor of the Exchequer has stated: 'There is nothing in the report of Lord Inchcape's committee to suggest that producers of gold are not entitled to obtain for their produce the best price available in the most favorable market, and I am now considering in what manner this can be secured.'

anodes. This process is limited in its usefulness by the relatively small quantity of material available and by its inapplicability to silver or gold contents. It may, however, develop in the direction of the treatment of low-grade sulphide ores, after a sulphating or chloridizing roast at a temperature low enough to prevent the volatilization of the lead chloride.

In the province of general metallurgy the increasing use of the Cottrell process deserves special mention. As an example of painstaking research in developing a practical process from a long-known but unused scientific fact it has few equals. We have to go back to 1870 to the work of Dr. Tyndall for the first disclosure of the phenomenon on which the process is based. This was further examined by Frankland, Lord Rayleigh, and Oliver Lodge; but for the useful application of the principles involved, we had to wait for Dr. Cottrell. He first applied the method to depositing sulphuric acid mist produced in the contact process, and is still being used for this purpose. It is satisfactory to report that the merits of the invention have been recognized in this country, the first plant to be erected here in 1917 being at one of the Government acid-plants. It is also in use here for the precipitation of fumes from metallurgical works, following established practice in America; its further extension in this country seems certain. The advantages of the process are far-reaching; not only are valuable products recovered, but agriculture in the neighborhood of the operations is saved from serious damage. We are glad to congratulate Dr. Cottrell on receiving the Perkin medal as a recognition of his valuable services to industry.

THE METAL INDUSTRY. In considering the position of the metal-producing industry before the War, one cannot but be struck with the apathy of the Government in regard to a matter of such vital importance to our security. It is true that as soon as the seriousness of the position was realized, energetic steps were taken to meet the situation. That within such a comparatively short time the difficulties were overcome is a striking tribute to the ability and energy of the technical men in this country. Industries were created and developed in a period of months which had been the subject of many years' growth on the part of foreign producers; not only were we able to produce articles equal to those obtained from abroad, but in many cases higher standards of purity and efficiency were achieved. The production of high-grade tungsten already referred to is an example of this, while in other directions the manufacture of magnetos and optical glass has reached a state of perfection unsurpassed by makers possessing prolonged experience.

These facts demonstrate that our position in pre-war days was in no sense brought about by lack of technical knowledge or skill, though it has been usual to refer to our inferiority in this direction, as well as to lack of initiative and energy, as being the true cause. The experience of the War shows this view to be unfounded, and that given reasonable facilities and the absence of official and fiscal discouragement we can, so far as technical

knowledge is concerned, place ourselves in the front rank as producers of all essential materials. This charge having been proved to be baseless, it is clear that in order to maintain our position as producers some protective steps must be adopted; failing this, there is every reason to suppose that our new or revived industries will relapse into their pre-war inefficiency. It is reported, for instance, that efforts are being made to re-introduce foreign glass into this country, which if successful (unless effected under conditions which will protect our own manufacturers) cannot but tend to harm, if not to destroy, an industry which, under war conditions, has succeeded in re-establishing itself.

I am, of course, referring here only to such industries as were either non-existent or were in a struggling state, and this condition obtained largely in the production of certain essential metals. This possibility has been officially recognized, and committees have been formed to examine into the problems and make recommendations. Lord Balfour of Burleigh's committee on commercial and industrial policy after the War has made an exhaustive inquiry into the subjects covered by the Terms of Reference. A study of the committee's final report reveals the complexity of the subject. The departmental committee's report on the iron and steel trades ascribes the relatively stationary condition of this industry in part to deficiency of our iron-ore resources, but primarily to greater efficiency of German and American methods.

A point is made of the individualism of the British character which prevents the manufacturer from "pooling his brains and capital to the greater ultimate advantage of the industry." This would appear to be a just charge. It is well known that with few exceptions large amalgamations are not looked upon with favor in this country, where moreover every effort is made to maintain secrecy in regard to working processes and operations generally. I cannot say from personal knowledge how far this applies to the steel trades, but it is very evident in other metal-producing industries. I am satisfied that nothing but benefit would result from removing the restrictions to open discussion which persist in this country. We should do well to open our works to the visits of technical men interested in the subject, as this would inevitably result in the exchange of experience and information to mutual advantage. The present attitude is certainly not dictated by the technical managers, who as a body would welcome such an interchange of knowledge, but are excluded from this benefit by the action of their employers.

W. R. Ingalls, in his admirable presidential address before the Mining & Metallurgical Society of America this year, says on this subject: "One of the cardinal principles of American engineering during the last 20 years has been the exchange of information and the promotion of publicity about everything—technical processes, business relations, corporate affairs. We have seen America forge ahead largely owing to the absorption of this idea, while Great Britain lagged behind. . . . She is wide awake now."

It is to be hoped that the awakening referred to has indeed taken place. Apparently this secrecy is not confined to our own special branch of industry. C. F. Cross, in 1916, on the occasion of the presentation to him of the medal of the Society of Chemical Industry, said: "He was particularly aware of the difficulties which they had encountered, especially that of being between the cross-fires of the commercial or financial man whose watchword was secrecy and the scientific man whose disinterestedness, perfectly natural and spontaneous, led him always to wish to publish in order that he might communicate what he had found in his laboratory to his fellow scientific men. . . . They . . . were always most anxious to take counsel with their brother chemists, and give them the benefit of anything that had impressed them, just as they looked to hear of any new discovery by others at the earliest possible moment."

This condition is reflected in our own Transactions (and to a less extent in our technical journals), which contain but little information on important undertakings in this country. In analyzing the papers published in the last ten volumes of our Transactions, I find that 35.8% deal with mining in foreign countries and our dominions and colonies. Foreign, etc., metallurgy supplies 17.3%; assaying and analysis 15.0%; general 27.7%, whereas British mining in these islands is confined to a solitary paper, and British metallurgy to six papers, or 3.5% of the whole. It is true that some of the general papers find application here, but the record can only be considered as unsatisfactory in that it fails to present in any adequate manner important operations which we know are being conducted. I hope these remarks may have some effect in removing the veil of secrecy which overshadows our undertakings.

Reverting to the committee's report, the Departmental Committee (iron and steel) favors combination both in production and in realization of produce, but is also of opinion that protection in some form is required to give security to industry. Other departmental committees report on similar lines, ten such being in favor of a tariff, while three (representing the cotton, jute, and ship-building industries) report against. The main committee is by no means unanimous on the point, but it should not be beyond the capacity of the Government to reconcile the conflicting views, and decide on the course most advantageous to the country as a whole. It would be out of place and indeed superfluous to discuss the well-worn arguments for and against tariffs, though it would probably be found that the majority of the members have very definite views on the question.

Though the committee leans toward protection it expresses the fear that such might result in stereotyping inefficient methods, but in my view there is little ground to support this. I anticipate, on the other hand, that the feeling of security engendered by a suitable degree of protection would stimulate producers to adopt modern methods involving capital expenditure which under present conditions they decline to risk.

The committee is strongly of opinion that State con-

trol will be found detrimental to peace conditions, a conclusion with which most will agree, though recent action in regard to both coal mines and railways does not encourage the hope that this opinion will find favor. It is also eminently satisfactory that they agree with the resolution adopted by the Imperial War Conference as to the formation in London of the Imperial Mineral Resources Bureau. Much of the foundation work of the bureau has been accomplished, and there is good ground for anticipating that the hopes of its promoters will be realized.

It was my intention to discuss in some detail certain aspects of the problem of reconstruction in so far as our special interests are affected, but these have been so fully and carefully analyzed by W. R. Ingalls, in his address already referred to, that little remains to be said. I am in no sense detracting from the merits of his remarks when I say that he is addressing those who are already converted, but few have the knowledge and ability to put the case so succinctly and convincingly. It is earnestly to be hoped that it may come into the hands not only of Labor leaders, but of those in control of Government departments having relations with mining and metallurgical matters. Naturally he deals mainly with American affairs, but his arguments bear with equal force on conditions existing here. He makes reference to these, but in my view his opinions on our position are somewhat too sanguine. He will pardon me for giving one or two extracts. He quotes the view of an American visitor to this country, who says:

"England is knitting together for work. The directors of capital and organized labor were never more together. . . . England is studying efficiency and is preparing for overseas competition."

Mr. Ingalls himself says:

"We have seen how Great Britain practically lost important metallurgical industries . . . and we see her now keenly studying and introducing improvements that will . . . not unlikely put her ahead of us."

It will be admitted that there is some tendency in this direction, but the union and progress foreshadowed are still far from achievement. No doubt his reference to conditions in Europe are designed primarily to stimulate the efforts of his own countrymen. The ever-growing concessions of shorter hours at higher pay must be carefully watched in their effect if we are to maintain our position against foreign competition. From this point of view it is almost a matter of satisfaction that similar claims are being put forward in America.

Mr. Ingalls in his masterly address shows the economic fallacy underlying such demands as have recently been pressed. I take the liberty of making two more quotations: the first, addressed to the American engineer, has equally forceful application to ourselves:

"First of all, what I see is that the engineer should saturate himself with sound economic doctrine. This is just as much the basis of his professional work as are the sciences of physics and chemistry."

The second will, I hope, reach the class to whom it aptly applies:

"The social reformer, who does not understand production, is a far less important person in the promotion of human welfare than the engineer who does."

The principles he lays down as to the general economic position apply with perhaps greater force to this country, since we are to so large an extent dependent on overseas countries for our supply of raw materials.

It is beyond my capacity to forecast the future of metallurgy in this country. Our industry is suffering in common with many others from the lack of any clear indication of the fiscal policy of the future. The Minister of National Service and Reconstruction has certainly stated that all raw materials required for national industries would be admitted without restriction, but whether this applies only to the reconstruction period or is to be the final settled policy, seems uncertain. So far as his statement goes it indicates that ores, which are essentially raw materials, will be admitted freely, and to this extent the smelting industry would benefit; but if metal, such as spelter, which may be looked upon as raw material from the galvanizer's point of view, is also included in the list we may have a hard task to hold our own. In regard to this, however, there is ground for a hopeful outlook, as he also intimated that industries which it was essential to foster would receive a measure of protection in some form. I think it will be admitted the production of metal is among such industries.

Regarding the labor situation, we are, I think, justified in anticipating that the Industrial Conference will lead to greatly improved relations between Capital and Labor, though up to the present some of the more important groups have held aloof from the Conference. It is to be hoped that legislative effect will be given promptly to the proposals and that the National Industrial Council will be the means of promoting and maintaining industrial peace.

Though the future may be beset with difficulties it is not the time to take pessimistic views, but rather to use every effort to meet them and to accommodate ourselves to the new conditions brought about by the War. Shakespeare puts the following lines into the mouth of King Henry V when in a position of difficulty before Agincourt:

" . . . 'tis true we are in great danger;
The greater therefore should our courage be.

There is some soul of goodness in things evil
Would men observingly distil it out."

It is in this spirit that we must go forward, striving if possible to extract the small essence of goodness which may, after all, be extractable from the vast slough left to the world as a war legacy.

GOLD PRODUCTION of the Lena property in Siberia, during 1916-'17—the latest figures just to hand—was 380,273 oz. from 569,513 cu. yd. of gravel. This return was well up to normal. As the mines are 5000 miles from Petrograd, and 1000 miles from rail, Bolshevism did not affect the community in that year.

Oil-Land Valuation

A bulletin on the 'Decline and Ultimate Production of Oil-Well, with Notes on the Valuation of Oil Properties', by Carl H. Beal, has just been issued by the U. S. Bureau of Mines. One of the most vexing problems that confronts petroleum producers and petroleum engineers is the estimation of the total amount of oil that may be obtained from the oil-wells and from oil-lands, and the rate at which the future productions may be obtained. This is a problem upon which much thought has been given and much work been done in the past, but it has only been within recent years that it has been brought down to a rational engineering basis. The bulletin of the Bureau of Mines is a record of the work done by many engineers with much information in advance that has been developed by the Bureau of Mines. It is obvious that an estimate that is reasonably reliable is an extremely valuable bit of information to the producer, to the prospective buyer, to the pipe-line companies, and to refiners depending upon certain sources of supply, and for the purpose of determining depletion allowances for book-keeping or taxation. In the past this has usually been done upon the personal judgment of the producers of wide experience, though many of the principles employed in this bulletin have been used consciously or unconsciously by producers; as, for example, observing the rate at which production falls off. The bulletin is the result of a rational and systematic compilation and analysis of records whereby essential principles and facts are established and the factor of personal experience and judgment is almost eliminated.

The bulletin outlines old and new methods for estimating the output of oil-lands and gives numerous curves and other data which should be of great assistance to oil producers and engineers in determining the probable amount of oil that a property might yield. The problem of the application of methods of oil-valuation is covered and explanations given in the use of methods in computing depletion allowances in book-keeping and in taxation. The bulletin should do much toward developing scientific methods for the buying and selling of properties, amortizing capital investment, and in estimating future productions of properties in the United States.

TIN PRODUCTION of Tasmania during the past four years was 2256, 2637, 2855, and 4010 tons, respectively. This is oxide, carrying 70% metal. The industry employs 1260 Australians. The largest producers last year were Mt. Bischoff (lode) with 458 tons, Briseis (alluvial) 321 tons, Pioneer (alluvial) 264 tons, Mt. Bischoff Extended (lode) 155 tons, and Royal George (lode) 112 tons. From 1880 to 1918, inclusive, the total output of the State was 126,846 tons of oxide, valued at £13,236,078 (\$63,100,000).

AMORPHOUS GRAPHITE to the amount of 6560 short tons, valued at \$69,455, was sold from mines in Colorado, Nevada, and Rhode Island. The output of amorphous graphite in 1917 was 8301 short tons, worth \$73,481.

Electric Hoisting Equipment at the Butte & Superior Mine

By OLIVER E. JAGER

The present electric hoisting equipment at this company's mine at Butte, Montana, has now been in operation about two years, steam-hoists having been employed prior to this. The installation of the new hoists is so closely connected with the history of the mine itself that it is of interest to review briefly the course of events.

The mine is in heavy ground; faulting is frequent, and there is considerable movement of ground. On account of these factors the old shaft had got into such bad condition that it was decided to sink a new shaft and equip it with a new hoist. This brought up the question of the 'chippy' hoist, which had been run unbalanced, and hence with heavy consumption of power. To reduce this power consumption it was suggested to run the chippy with a counterweight, but on developing the idea it was found better to substitute a cage for the counterweight, which meant another compartment in the shaft. The plan of the proposed new shaft embodying all these features now showed that it was entirely too large for the prevailing conditions, so it was decided to sink two shafts about 60 ft. apart. These two shafts were arranged to assist in the development of the ventilation system (actually they are both down-cast), and certain safety-first ideas, such as connections, fire-doors, and sprays, were included in the design. The hoisting equipment was to be a permanent feature, not changing with depth, and was designed for an ultimate depth of 5000 ft. The design called for a rope-speed of 3000 ft. per minute, so that about 160 tons per hour could be hoisted. The adoption of electricity as the motive power for the new hoists was decided upon only after all the factors of cost, reliability, and electric design had been considered. One of the determining factors was the amount of steam required by the milling process. The discussion of the relative merits of steam and electric hoisting is outside the scope of the present article. Suffice it to say that electric hoists have reached a stage of dependability unknown ten years ago, while the inter-connecting of the various ramifications of the Montana Power Co. guarantees a supply of power in which interruptions are extremely rare.

The main shaft has two skip-compartments and one small compartment for signals, etc. The 'chippy' shaft has three full compartments, two for skips and one for pipes and power-lines. The steel head-frame at the main shaft is 135 ft. from the ground to the centre of the sheaves, which are of 12 ft. diameter. The main hoist is set back 400 ft. from the head-frame, the ropes running over idlers on two steel towers placed between the shaft and the hoist-house. For handling men, four super-

imposed cages are used in each compartment of the main shaft, and two cages in the chippy shaft-compartments, making 12 decks in all. This means 120 men lowered at each round trip of both hoists, an important factor when sending a shift of 600 men into the mine. The skip weighs 5 tons, and holds 7 tons of ore; the cage above it weighs 2.5 tons, making a total load of 14.5 tons. The rope is of 1.5 in. diameter and weighs 4 lb. per foot. The rope at the chippy hoist is of 1½ in. diameter.

Both the Ilgner and Ward-Leonard systems are embodied in the hoisting equipment, but they are too well-known to call for more than brief mention here. The heavy fly-wheel on the motor-generator set is the main feature of the Ilgner system. When the load on the generator becomes heavy, as at starting, the set is slowed down by a regulator on the A.C. motor, causing the fly-wheel to give up some of its stored energy and put into the system power that would otherwise have to be drawn from the supply mains. Peak loads, and hence cost of power, are thus reduced. On the other hand, if the descending load in the shaft speeds up the hoist, the D.C. motor becomes a generator and puts power into the motor-generator set, thus speeding up the heavy fly-wheel. When the speed of the latter is 5% over synchronous, the induction motor also acts as a generator and feeds alternating current back into the power-lines. The Ward-Leonard system applies to the regulation of the hoist-speed by varying the field strength of the generator that supplies power to the hoist motor.

The diagram shows the arrangement of the main hoist as it will appear when complete. While not the largest electric hoist in the world, it will be the largest of the fly-wheel type. The photographs show the present condition of the equipment, in which the motor-generator set consists of one A.C. motor, one fly-wheel, and one D.C. generator with exciter; the hoist has one D.C. motor. When complete, a second fly-wheel and D.C. generator will be added to the motor-generator set, and a second D.C. motor to the hoist. These additions will be made as the shaft approaches its ultimate depth of 5000 ft. The main hoist and the chippy hoist are in separate rooms, each having its own overhead crane. This is a good arrangement, as it means that the lighter machinery of the chippy hoist can be handled by a small crane, leaving the big crane for the heavily constructed main hoist. The motor-generator set for the chippy hoist is in the same room as the main hoist.

The induction motor that drives this set is developing about 1400 hp. at present, but when the set is complete it

THE SHAFT-BUILDING OF THE BUTTE & SUPERIOR MINE, SHOWING HEAD-FRAMES, STEEL IDLER TOWERS, AND CHIPPY HOIST

ELECTRIC HOIST, SHOWING D. C. MOTOR, HOIST-DRUMS, OIL-PRESSURE RELEASE FOR BRAKE AND CLUTCH, ENGINEER'S CABIN, OVERHEAD CRANE, ACCUMULATOR AND SWITCHBOARD ON RIGHT AND M. G. SET FOR CHIPPY SHAFT IN THE CORNER.

will develop 2000 hp. To give the higher rating, an alteration will be made in the winding, the present series-delta being changed to a parallel-star. The speed is 500 r.p.m. and the voltage is 2200. A three-phase 60-cycle current is taken from the Montana Power Co. at the above voltage, two separate lines coming in from their main sub-station, about a mile from the mine, so that it can be arranged to run the hoisting equipment on a line separate from that supplying the power for the mill. The induction motor has an automatic slip-regulator for inserting resistance into the rotor to reduce the speed. This regulator operates when the load comes on at starting and during the acceleration period, thus preventing a too heavy demand on the power-line. As the speed of the set is reduced, the fly-wheel gives up energy to take the peak load. The fly-wheel is a disc of 12 ft. diameter, built up of steel plates riveted together, its effective weight being 60 tons. At 500 r.p.m. it has a peripheral speed of 18,850 ft. per minute. It is mounted on a shaft of 18 in. diameter, which runs in two water-cooled bearings, each 4 ft. long, lubricated by both ring and gravity-feed systems. Besides these, oil at a pressure of 1500 lb. per square inch can be forced under the shaft for raising it off the bearings when it is desired to start the set after a stoppage. The fly-wheel is housed in order to reduce wind friction. The D.C. generator is a 1500-kw. shunt machine with interpole and commutator windings. Its field is controlled directly by the hoist-engineer, as will be explained later. The maximum voltage is 650. In case of shutting down the motor-generator set for any reason, there is provided a reverse-switch for putting a counter-torque on the motor, resulting in its coming to rest in about five minutes, as against 2½ hours if left to run free. The exciter for the set is a 60-kw. 250-volt shunt-machine, whose voltage is kept constant by a Terrill regulator. The exciter is for both motor field and generator field excitation, and for the control of all the safety-devices. In case of accident to this machine, a spare exciter (a motor-generator set) is provided. All these machines are rated at a continuous operating figure allowing for a 40°C. rise in temperature; they are all capable, as far as commutation is concerned, of taking a momentary over-load of 100%. The weight of the motor-generator set (including the fly-wheel) as in use at present is 285,000 lb. When complete it will weigh about 500,000 pounds.

The two drums on the hoist consist of cast-iron spiders with shells of rolled-steel plate. The present diameter is 9 ft., but this will be increased to 12 ft. for the complete equipment, when each drum will carry 5000 ft. of 1½-in. rope in two layers. The present speed of hoisting with the 9-ft. drums is 2260 ft. per minute. The capacity to 3000 ft. depth is 216 tons per hour, allowing for an acceleration period of 20 seconds and a retardation period of 15 seconds. The diameter of the shaft is 16 in., with the connecting flange forged solid. Lubrication of all bearings is by ring and gravity-feed systems. The maximum speed is 80 r.p.m. Brakes are applied by weight and released by oil-pressure, though there is not so much brak-

ing necessary with an electric as with a steam hoist, the speed of the former being reduced by moving the controller back, the brake being applied only for the final stoppage. Oil at a pressure of 100 lb. per square inch is supplied by triplex pumps (installed in duplicate), while an accumulator is provided on the line, which would give several operations of brake or clutch should the pumps go down. The D.C. motor is direct-connected to the drum-shaft. It has a continuous rating of 2000 hp. but is capable of a heavy over-load, as is demonstrated by the ammeter when starting, the current being between 4000 and 5000 amperes. The maximum voltage is 650. The weight of the hoist without the motor is 375,000 lb., the motor weighing 180,000 pounds.

The hoist-engineer sits in a closed cabin lighted by windows and ventilated by a fan. He has three levers in front of him, one being the master-controller, the others the brakes for the two drums. Two cranks for operating the clutches are placed one on each side of him. Engineers accustomed to hoisting by steam have no trouble in learning to operate an electric hoist; in fact, they prefer the latter once they have become familiar with it. The master-controller works a series of contactors on the switchboard, which cut resistance in or out of the generator-field to regulate the speed of the hoist. Since the field of the hoist-motor is separately excited, its speed will vary directly as the impressed voltage coming from the generator. The hoist will run at certain speeds, constant for each notch on the controller. The equipment is such that by pushing a button the speed is automatically reduced for hoisting men. This control is independent of the master-controller, but is seldom used. Welsh safety-devices prevent over-speed or over-winding; they operate by shutting off the power and applying the brakes. In addition, a limit-switch is being put into the shaft, which will be positive in its action. Should the indicator on the Welsh device slip, the over-wound cage will hit the limit-switch mounted on the head-frame. To ensure reduction of speed at the proper point, there is a cam slow-down device that pushes over the master-controller as the cage approaches the collar of the shaft. This device operates should the engineer not slow down, and will ensure the hoist being at a low enough speed for its prompt stoppage if the cage should open the limit-switch. Power (if on) is cut off, and brakes are applied if power from the generator to the hoist-motor fails for any reason; if power for control, or for the motor-field, is lost; if the motor-generator set over-speeds owing to power coming back into the circuit. In case any safety-device functions, the controller must be brought back to the central position before brakes can be released. All safety-devices work on the closed-circuit principle, so that if a wire breaks, or the current goes off the circuit for any reason, the safety-devices operate and the hoist stops. All these automatic safety-contrivances have been tested in actual work, so that every confidence is felt in their reliability; besides which every effort has been made to eliminate all possible mishaps, such as are usually classified at an inquest as "unforeseen". In case the power-lines coming to the

mine go dead, there is sufficient energy in the fly-wheel to make several trips in the shaft with men. If the motor-generator set goes out of action altogether, of course, no hoisting can be done, the case being comparable to the complete failure of the boiler-plant at a steam-hoist.

The 'chippy' hoist may be regarded as a small edition of the main hoist, with one or two minor changes. The drum is 8 ft. in diameter by 9 ft. long, and makes 68 r.p.m., being geared to the motor-shaft by Wuest herring-bone gears. The motor on this hoist is rated at 600 hp. with a voltage of 500 and a speed of 450 r.p.m. There is

charge of R. E. Renz, chief electrician, whose assistance in the preparation of this article I wish to acknowledge.

TIN PRODUCTION of the Federated Malay States during 1918, according to the Chamber of Mines, amounted to 37,370 long tons, a decrease of 2463 tons. The exported ore or oxide averages 72% metal. The product is smelted at Penang and Singapore. The pre-war rate for reduction was 70 cents per picul of 133½ lb., but the present charge is \$1.47. The average price last year was \$85.30 per picul, an increase of \$23.72 in 1917. Since the close

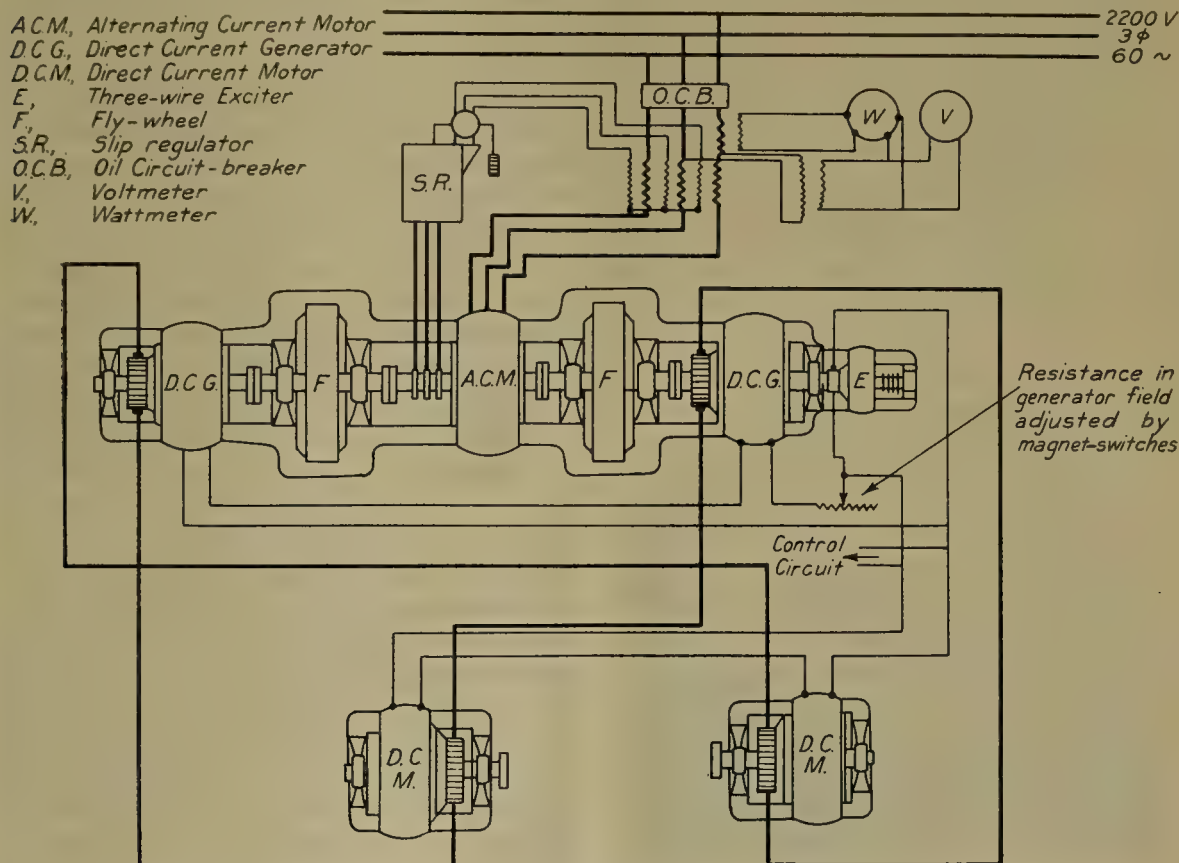

DIAGRAM OF CONNECTIONS WHEN OPERATING FROM 5000 FT. AT 3000 FT. PER MIN. SPEED OF ROPE

a flexible coupling between the motor-shaft and the shaft carrying the gear. The rope speed is 1660 ft. per minute. All the safety-devices found on the main hoist are installed on the chippy. For speed-control a face-plate controller is used instead of the contactors of the larger machine. The motor-generator set consists of an A.C. motor of 600 hp. making 720 r.p.m., a fly-wheel weighing 20 tons (to be increased to 40 tons when the depth is 5000 ft.), a shunt-wound generator of 500 kw., and a 7½-kw. exciter.

All windings on hoist-motors and generators are insulated with mica to take care of high temperatures. The hoists were made by Nordberg, and the electrical equipment by Westinghouse. All electrical machinery is in

of the year it has been necessary, owing to the absence of any market for tin, for the Government of the Federated Malay States to become a buyer at \$67 per picul, the price paid by the Government being subsequently reduced to \$56.78 per picul. The mining community contributed toward the revenue of the country in royalty alone \$7,462,062, which is 13.90% of the gross value of the ore recovered. This shows the substantial increase of \$2,097,840, or 39%, over the revenue derived from tin during 1917.—Consular Report.

THE OROVILLE DREDGING CO.'s boats in Colombia, South America, recovered \$28,950 from 28,767 cu. yd. at Pato, from April 10 to 28.

A Feeder for Oil or Acid in a Flotation Plant

STAFF CORRESPONDENCE

The feeder herein described is employed in the concentrator of the Anaconda reduction works. Some mention of this appliance has already appeared in print, but the present article goes more into detail in describing the feeder actually in use today.*

To each section of the concentrator there are two of these feeders, one for acid and one for oil. They supply the acid and oil for treatment, per 24 hours, of about 6000 tons of pulp, equivalent to about 1200 tons of dry material consisting of ground Wilfley-table middlings. To this is generally added some thickened slime, making the total pulp about 6780 tons. This pulp is elevated for

distribution to three standard Minerals Separation machines, with 15 cells and 14 spitzkasten each, and it is into the discharge of this elevator that the acid and oil are fed, thus obviating any corrosive action on the belt or buckets of the elevator. The feeders are placed side by side, and discharge into a lead pipe serving both, thus mixing the acid and oil on their way to join the pulp. Both liquids are sufficiently viscous to give a practically continuous thin stream.

The principal parts of the feeder are a box *A*, to hold the acid or oil; a bronze disc *B*, to carry the buckets; and a trough *C*, into which the buckets discharge. The box *A* is made of light steel plate, and lined with lead $\frac{3}{8}$ -in. thick. The inside dimensions of the box are: length 3 ft. 3 in.; width 1 ft. 6 in.; depth 1 ft. 4 in. A non-corrosive oil would, of course, not require a lead lining, and a steel disc could be used instead of one of bronze. The box is stiffened at the top by a light angle running around three sides. On the fourth side, it has a piece of angle to carry the bearing. Acid or oil is fed periodically into the box to maintain a sufficient level of liquid to fill the buckets. The bronze disc *B* is 3 ft. in diameter by $\frac{1}{4}$ in. thick. It is bolted to a flange on the shaft, and has the lead buckets attached tangentially to it. The details of the buckets are shown in the sketch. They are of $\frac{3}{32}$ in. sheet-lead, and have at one side a block of oval section to pass through an oval hole in the disc. The buckets are attached to the disc by driving a tapered pin through a $\frac{1}{2}$ -in. hole in the oval block. Should this hole become enlarged, a bolt with a washer may be used instead of the pin, the washer jamming against the disc. The capacity of each bucket is 330 cubic centimetres.

As the disc revolves, the buckets dip into the liquid contained in the box, elevate it and discharge it into the trough *C*, which empties into the pipe running to the discharge of the pulp-elevator. As originally designed, the speed of the disc could be varied by means of a friction-drive; but at present the drive is made directly by a bevel gear on the shaft, and the disc revolves at a constant speed of about one revolution per minute. To vary the feed, buckets are added or removed from the disc, plenty of holes being provided for this purpose. The trough *C* is of lead $\frac{1}{8}$ in. thick, and is of such form that the buckets can discharge into it and afterward pass clear of it. The wide end of the trough is supported by a lead bracket *D*, bolted to the edge of the box. The box-lining, trough, and buckets are all made up by the lead burners.

*Frederick Laist and Albert E. Wiggin. 'Flotation Concentration at Anaconda'. Trans. A. I. M. E., Vol. LV.

DREDGING at the Lenskoie property of the Lena Gold-fields company in Siberia has been postponed on account of the revolution in Russia. The first dredge was ordered in America over three years ago, is fully paid for, and awaits shipment at South Milwaukee. Reserves of gravel for dredging are estimated at 58,984,000 cu. yd., averaging 39 cents per yard recoverable. This is sufficient for two 17-cu. ft. boats for 16 years, according to C. W. Purington. In November 1917 there were 5379 men employed at the mines, who averaged only 0.14 cu. yd. of gravel per man-day.

REVIEW OF MINING

HOUGHTON, MICHIGAN

MORE UNDERGROUND WORK MAKES DEMAND FOR MINERS.

The demand for labor in the Copper Country has taken a sudden change; men are scarce, and there is work for every man here. All mines could use a few more men underground than they have at present. Sixty days ago the mines were laying off men and reducing production 50%. A total of 2500 men were discharged or quit; the majority were surface employees. Miners were not generally let out. Today there is not a mine in the district that could not use more trammers and miners. That does not portend an increase in output of ore, nor yet an increase in copper production; it simply means that shortage of cash is not the prime consideration with the mines. Rather was the action taken to prevent a too long continuance of an over-stocked metal market. The miners are at work in newer openings. Every operating company in this district is making the most of this opportunity to get its mine in good physical condition.

GOLD HILL, OREGON

STATE BUREAU OF MINES RESUMES INVESTIGATIONS.

The director of the Oregon Bureau of Mines, Henry M. Parks, has announced that the Bureau expects to do considerable field work in southern Oregon during the present season. The auto-truck engineer crew of the Bureau left Portland on June 3 for this region, and will be operating during the coming few weeks in the Jacksonville district south of Gold Hill. This outfit is an auto-truck upon which is mounted a complete sampling, crushing, pulverizing, and assaying plant. The power is operated by the motor of the truck. There will be four or five men in the crew, and they will make detail examination of a number of partly developed mines, most of which are now idle. Mr. Parks expects to be there during the preliminary work.

During the War, the State Bureau suspended all field operations, likewise its publications, but with an appropriation of \$50,000 by the recent Legislature, the Bureau will resume field work throughout the State and publish results. There will be also a systematic investigation of oil and gas possibilities. The field work in eastern Oregon is being done jointly with the U. S. Geological Survey, while the western part of the State is being investigated solely by the State department. The Bureau has contracted with a well known firm of consulting oil geologists to do the work in western Oregon.

The War Minerals Relief Commission will probably

hold a public meeting at Medford early in August to hear any further evidence in support of the claims filed for relief in southern Oregon and northern California.

The lessee of the Nellie Wright gold mine, R. M. Wilson, three miles east of Gold Hill, who recently undertook to unwater the mine preparatory to resuming operations, found that the present electric power-line and service were not sufficient to operate the mine and mill. The property is less than $\frac{1}{4}$ mile from the main transmission-line passing down the valley on the Pacific highway, but due to the lapse of this service during the 24-hour period, he will be forced to put in an independent wire to the sub-station at Gold Ray, a distance of 5 miles, at an expense of \$1500.

KESWICK, CALIFORNIA

OPERATIONS OF THE MOUNTAIN COPPER CO. DURING 1918.

The Mountain Copper Co. has issued its report for 1918. The profit from the sale of metals, acid, etc., was £88,159 (\$420,000). After charging £48,606 (\$230,000) for depreciation, £6722 (\$32,000) for American taxes, and £43,750 (\$206,000) for debenture interest, there

CONCENTRATOR OF MOUNTAIN COPPER CO., SHASTA COUNTY, CALIFORNIA

was a deficit of £7626 (\$36,000). Ores, metals, and stores on hand are valued at £155,674 (\$744,000); cash, £81,132 (\$380,000); investments, £162,021 (\$770,000); and sundry debtors £42,654 (\$201,000). Sundry creditors are owed £67,566 (\$320,000). The 6% debentures amount to £625,000 (\$3,000,000).

The consulting engineers, Burch, Caetani, and Hershey, reported as follows:

At Iron Mountain, developments in No. 8 mine were uniformly successful, resulting in an increase of reserves and average grade. The West vein contains 157,561 tons of 2.49% ore, plus 88,000 tons probable. Little exploration was done in the Complex mine, in which re-

serves are 93,596 tons of 2.22% ore, plus 33,500 tons probable. Miscellaneous ore in these mines is 17,700 tons of 2.22% ore. The Hornet mine is estimated to contain 1,320,000 tons. The New Year mine opened better than expected. Further drilling is to be done to find another 'layer' of ore; and later on, work may be done jointly with the Balaklala company.

The railway is in good physical condition. It is suggested that an aerial tram be constructed to take its place. The railway cannot be abandoned entirely for three reasons: (1) it is doubtful whether the Old Mine filling can be carried in buckets, it being uneven in size and sticky; (2) flotation concentrate is too sticky for buckets; and (3) the long timbers for the mine can hardly be carried by a tram. However, an aerial tram would reduce costs generally.

The Minnesota mill's capacity was proved to be 500 tons per day, instead of 550 as planned; but slight changes will remedy this. In order to produce a 15% copper concentrate, a tailing loss of 10% is expected. The new plant to treat Old Mine filling was completed at the end of the year. Preliminary tests showed good results.

At the smelter at Martinez, costs rose to a point somewhat above those of the period that preceded the change in mining and smelting methods. Abnormal conditions were the cause. The leaching plant worked well. It was to be enlarged to treat a larger quantity of calcined material from the Hornet mine. There was treated during last year 6023 tons from the Iron Mountain mine, 20,491 from No. 8, 27,418 from the Hornet, 16,001 of concentrates, and 8782 from other mines. The output of copper was 3448 long tons, or 7,723,520 pounds.

LEAD, SOUTH DAKOTA

GENERAL DEVELOPMENT AND MILLING NOTES.

CUSTER.—The Summit property near Oreville has been sold to John R. Bland, and men are getting it in shape for production. The copper ore can be graded easily by hand-sorting, and this will be done until such a time as the development warrants erection of machinery. It is expected that shipments to the smelter will be made regularly.

DEADWOOD.—Good progress is being made at the tunnel which is being driven to open the old workings of the Iron Hill mine in the Carbonate district. The tunnel has gained a depth of over 500 ft., and when completed will have a length of 1350 ft. Aside from draining and making these workings accessible, it will pass through virgin ground that in all probability will show mineral. The Iron Hill was the richest silver mine in the Black Hills, but has only been developed to a depth of 400 ft. The present work is being done by Eastern capital that holds options on the property and adjacent ground.

The Deadwood Lead & Zinc Co. has completed all arrangements for placing in commission its 10-stamp concentrator in Spruce gulch. A delay in the delivery of suitable motors caused an idleness of several months. The new equipment is expected shortly and the plant will

be in operation before July 1. The mine has been developed to a point where a continuous output of ore is assured.

The Cutting Mining Co., whose property adjoins the Homestake on the west, is continuing development. A shaft is being sunk, and has gained a depth of 250 ft. This will be continued to 500 ft., to be followed by extensive lateral work. A new single-drum hoist and Ingersoll-Rand compressor have been installed. Electric power is used. A good grade of gold-silver ore was opened in the upper workings, and this is being developed with depth.

ENGLEWOOD.—The Custer Peake Copper Co. has completed erection and started a concentrator. Wilfley tables and Bland screens are used. The Jungle mine, which is being worked by the company, shows copper ore on several levels, and is said to contain 4% native copper. The ore will be dressed and shipped to the smelter.

HILL CITY.—The National Tin Co., formerly the American Tin Co., has resumed work at the Cowboy and Mohawk mines. Ore is being broken in the former, and the latter is being developed. It is proposed to sink the Cowboy shaft, now 300 ft. deep, to 500 ft. A new 550-ft. Norwalk compound compressor has been added to the mine equipment. Additions are being made to the concentrator, and seven Wilfley and eight Isbel slime-tables have been purchased. In addition to this, a ball-mill for re-grinding has also been added. Alexander Roy of New York has been placed in charge as general manager.

LEAD.—Sinking of the Ellison shaft of the Homestake company has been started. At present this shaft is down 2090 ft., including a sump 90 ft. It is proposed to sink several hundred feet and cut stations every 150 ft., then open the levels. The storage for 10,000 tons of coal has been completed. An Erie $\frac{3}{4}$ -yd. clam-shell bucket-shovel is used in loading the coal into cars from the open bin, for distribution.

TROJAN.—The Dark Horse and General Grant properties have been leased to Manion, Harris, and Stewart and regular shipments of ore are being made to the Trojan cyanide plant.

DIVIDE, NEVADA

DEVELOPMENTS AND PROPOSED WORK BROUGHT DOWN TO DATE.

Ore production from the Tonopah Divide mine continues at the rate of 60 tons daily, mill-heads ranging from \$30 to \$35 per ton. This ore, shipped to the Mac-Namara mill at Tonopah, is drawn from all parts of the mine; from the four main levels and connecting raises. On the second level the south-east foot-wall drift is being advanced in good ore. It was the shortest of the south-east drifts, having advanced 160 ft. from the shaft cross-cut. The third level south-east drift was resumed lately from a point 350 ft. from the shaft cross-cut and is in ore of shipping grade. Two raises from the fourth to the third level were recently holed through. The first raise, 50 ft. from the shaft cross-cut, broke ore throughout averaging \$60 per ton; the second, 250 ft. from the

cross-cut, was in high-grade ore all the way, the product for over 30 ft. near the top averaging \$285 per ton. The fourth level drift to the south-east, resumed after the new compressor was started, has been breaking ore of high grade, having entered the rich shoot in which a sill 30 by 50 ft. was opened on the third level. This drift has exposed large masses of quartz, the first found in quantity in the mine. The presence of quartz does not affect the value of the ore. Two cross-cuts were started from the fourth level drift, which is on the hanging-wall side of the ore-channel, but neither exposed the foot-wall at a distance of 30 ft. from the drift. Both cross-cuts continued in rich ore. The consulting engineer, A. I. D'Arcy, says that the fourth level has proved far richer than levels above, and declares that the uniformly high value of ore throughout the large area developed, rather than bonanza spots and sensational assays, establishes the great value of the mine. The fifth level cross-cut is being driven to the vein, at a depth of 581 ft., and at the present rate of progress, about 7 ft. daily, should penetrate the hanging wall before the end of June.

Seams of rich ore were exposed in surface prospecting some time ago on the Divide Extension property, 600 ft. north of the main shaft. An assessment hole had been dug at this point by 'Jimmy' Grimes, a pioneer prospector and claim-owner of the district, who had abandoned this ground. A shot in the bottom of this hole exposed ore stringers and Ed. J. Bevis, the superintendent, after obtaining the consent of Zeb Kendall, president and manager, proceeded to sink a prospect shaft here, using a windlass. Rich seams were found in the course of sinking, and at a depth of 45 ft. laterals were started north-west and south-east. These were designed for drifts, but as work progressed it was shown that they were cross-cutting a wide fracture-zone, with a trend that has since been agreed upon as N.22° E. Well-defined walls were found 55 ft. apart, with a south-east dip, and drifts have been advanced north-east on both walls. Both have continued in high-grade ore, the foot-wall drift having exposed faces continuously sampling from \$150 to \$320 per ton, and the hanging-wall drifts ranging from \$50 to \$150 per ton. The ore between these drifts is said to average over \$25 per ton and the waste-dump, taken from the shaft and cross-cuts, is of shipping grade. This shaft is being timbered and hoisting equipment will be working shortly. Surface trenching has exposed the vein farther north and near the Dividend side-line, where high assays are obtained from these trenches. The main shaft is 400 ft. deep, and a drift will be driven, following the north-west vein, to reach the north vein.

On the Dividend property, trenching has exposed the Extension vein near the joint boundary, where this vein is intersected by another with a strike nearly east. At the point of junction the latter vein is said to swing to the north, uniting with the Extension vein and forming a large fractured area that appears to be enriched to a high degree. At one point, assays ranging from \$50 to

\$150 were obtained across 12 ft. of this material. The ore throughout this zone is said to contain argentite and stephanite, and good authorities express the belief that its source is at considerable depth. The Dividend main shaft, 1500 ft. north-west from this point, is down 500 ft., where a station is being cut. On the 300-ft. level a cross-cut has been driven within an estimated distance of 50 ft. from the north-west vein. This cross-cut will be continued to the vein, while another will be extended in the same direction on the 500-ft. level. George J. Murphy is superintendent. Control of the Dividend company is said to have been purchased by men controlling the Divide Extension, including Herbert G. Humphrey of Reno, one of the largest wool-growers in the country; Zeb Kendall, George Wingfield, and John H. Miller. These men control the largest enterprises at Divide.

At a depth of 180 ft., the shaft of the Divide Consolidated is in the typical ore-bearing material of the district—a silicified highly-oxidized rhyolite-breccia—and for the last 15 ft. box-samples have ranged from \$9 to \$48 per ton. The property has one of the best plants in the district, and the shaft is making rapid progress. Throughout the Divide district the ground breaks and stands well; little or no timber is required and a 6-ft. round in lateral work is not unusual.

In the East Divide workings, the south drift is advancing 12 ft. daily with two shifts. The east cross-cut on the 400-ft. level penetrated the foot-wall of a vein 93 ft. from the shaft. This vein is 26 ft. wide, the entire mass averaging \$7 per ton. The south foot-wall drift has progressed over 100 ft. in similar material, and is showing seams of rich sulphide. It is being driven to reach the point where this vein intersects the main east fissure, below the great blow-out east of the shaft.

The Florence Divide company recently purchased the Witt-Brandon-Taylor-Mechling lease on part of the Red King claim of the Florence Goldfield property, and ore as rich as any ever taken from the bonanza leases on that property is being sacked for shipment. The richest, assaying \$5 per pound, is stored in bank vaults. The second-grade ore assays from \$500 to \$1500 per ton and the miners have ready 200 sacks of this material, while the third-class product, worth from \$75 to \$200 per ton, will be shipped without sacking or sorting. At one point the richest of this ore is nearly 2 ft. wide. It is broken with great care, by stripping the bonanza streak.

On the Brougner Divide, efforts are being made by trenching to locate the Extension vein.

The Gold Zone is extending cross-cuts north-east and south-west on the 500-ft. level, having found only narrow seams of ore in exploring the main fissure-zone.

The Tonopah Hasbrouck is shipping ore at the rate of 50 tons per week to the MacNamara mill at Tonopah, and is blocking a substantial tonnage in work conducted from the lower tunnel, and in re-opening the old workings from a cross-cut at the 200-ft. level of the main shaft.

The Sutherland Divide is developing on the 300 and

400-ft. levels from the incline shaft, and has started to sink another 200 ft. Seams of rich ore have been found on the 300-ft. level. This shaft produced ore for shipment some 15 years ago, the ground being owned early in 1901 by the South Tonopah Mining Co., the first company after the Tonopah Mining to be incorporated in the Tonopah region.

Among properties now well equipped and sinking are the Victory, Belcher, Mohawk, Consolidated, Smuggler, Gold Wedge, Eureka, Farrell, Kernick, Reno, Belcher Extension, High Divide, Annex, Horseshoe, Mammoth, Ben Hur, Operator, Gold Reef, Alto, Allied, Crown, Bevis, Mecca, Western, Junior, Hull City, Liberty, Calumet, Trilby, Rosetta, Divide City, Florence, East Divide Extension, Mizpah, Aztec, Argentine, Apex, Giant, Hercules, Anchor, Chariot, Syndicate, Grimes, Emancipator, Hasbrouck Divide, Hennessy, Jim's, Myra, North, Northwest, Old Timer, Pershing, Rand, Revert, Silver King, Toggery, Verdi, West, Wilson, and Argonne Divide. Several of these have exposed highly mineralized fracture-zones, similar to those in which pay-ore has been found. Surface prospecting is being conducted on a number of properties, with the object of finding the best sites for sinking.

GRASS VALLEY, CALIFORNIA

STRIKE MATTERS.—LITIGATION OVER TOWNSITE PATENT.

Events connected with the strike during the past week are chronicled as follows:

A number of men have left the district for Nevada centres. These were principally single men, who in most mining centres move about a good deal.

The deputy State Labor Commissioner, John S. Blair, has been endeavoring to effect a settlement. Suggestions from both sides were exchanged. A compromise proposed by the operators on June 24 was rejected by the men, who are holding out for the extra 50 cents a day without any concessions. The proposal was:

"First: We will abolish the bonus system.

Second: We will establish a free market at no cost to the purchaser or seller. This will eliminate the middleman and his profits. The free market will be able to supply goods to the consumer at the lowest cost, overcoming expensive book-keeping, delivery, and service costs. The free market will handle boots, dry goods, meats, groceries, and in fact, goods of every description.

Third: We ask that hereafter should any grievance arise that these be taken up with the management and discussed fully, and in a proper manner before any drastic action is taken.

Fourth: We propose a percentage wage increase along the lines suggested by some members of your committee, as follows: At the end of a year from date we will pay 10% of the total wages earned by every man who has worked for us continuously throughout the year.

Fifth: As a proof of our sincere desire to aid you we will pay on next pay-day one-half of the wages lost by our employees, provided that you return to your former work promptly after the settlement of this matter."

In the M. & S. P. of June 21, it was stated that the North Star Mines Co. was to pay a dividend of 40 cents per share on June 28. The Grass Valley 'Union' of the 24th contained the following:

A. B. Foote, superintendent of the North Star mine, gave out the following signed statement yesterday concerning the dividend of 40 cents per share stated by the 'Mining and Scientific Press' as about to be paid by the North Star Mines Company:

The article appearing in the 'Mining and Scientific Press', referring to the dividend declared by the North Star Mines Co., is misleading, and in the light of certain statements made by the management, requires explanation. The dividend declared a year ago was paid out of the reserve fund, and the one declared payable the 28th of this month is to be paid out of the same fund. Neither of them could have been paid out of the profits of the past year, since there was no profit.

The company has kept a large reserve fund to carry it over periods like the present, and also because it carries no insurance. Some of the stockholders are dependent upon the income from their stock, and to help them it is necessary to distribute some of this reserve fund.

ARTHUR B. FOOTE,
Superintendent.

During 1918, the North Star company made an operating profit of \$57,668, but after allowing for depletion and depreciation, on the same basis as in previous years, the past year ended with a deficit of \$221,735. The balance at the end of 1918 was \$950,648.

On the 25th the men organized with a full complement of officers. J. B. Bennetts was elected president and Fred Osborne recording secretary. About 1000 signed the roll. Future meetings are to be in secret. The special committee of 12 heretofore selected is to be retained as a standing committee to resume negotiations at any time.

The strike came to a close soon after midnight on June 29 when the men voted unanimously to accept the compromise proposal of the operators.

The compromise provides for a wage increase of 10%, the sum to be paid as a bonus at the end of the year, the interest of workers of shorter periods than a year to be safeguarded. The men are to receive half-pay for the time lost during the strike.

A decision of much interest to mining men has recently been rendered by the Secretary of the Interior in the matter of the application of Golden Center of Grass Valley Mining Co. for a patent for a lode mining claim situated within the City of Grass Valley, Nevada county, California:

The company, on October 2, 1917, filed in the United States Land Office at Sacramento, an application for its lode claim situated in Grass Valley, claiming same under a lode location made in the year 1878 or 1879. The legal subdivision of land upon which the claim was situated appeared to be patented without any reservations, to the Trustees of the City of Grass Valley, under the townsite law upon a final entry made of said land by the townsite authorities under date of June 18, 1869.

The company filed with its application for patent, an application for a hearing, asking that it be allowed to prove that the land it claimed as a lode claim was at the

date of the townsite entry a known mine, or that it was at that time being held as a mining claim which possession was recognized by local authority.

The local Land Office at Sacramento refused the applicant company a hearing. This was based on the ground that the records of the Department of the Interior disclosed the fact that when the authorities of the townsite of Grass Valley were seeking to make the townsite entry, a hearing was ordered and heard before the local officers at Sacramento, as to the character of the land applied for by the townsite authorities. Based on evidence taken at this hearing, the Commissioner of the Land Office by a decision rendered on July 3, 1871, held that the land applied for by the townsite authorities was more valuable for agricultural and townsite purposes than for minerals. This decision was followed by a patent to the townsite authorities of the legal subdivision covering the mining claim of the applicant company, and the decision and patent barred the applicant company from asserting further claim to the lode claim for which patent application was made.

The Golden Center company appealed from the decision of the local office to the Commissioner of the General Land Office, who affirmed the decision of the local officers holding the townsite patent to be conclusive against the mineral claimant. The mineral claimant appealed to the Secretary of the Interior, who, in a decision recently handed down, reversed that of the local officers and the Commissioner, and holding that the decision of July 3, 1871, was not binding on the Golden Center or Grass Valley Co., and that it was entitled to a hearing as asked for.

In this decision, the Secretary states that the evidence in the case before the Commissioner taken at the hearing had, prior to July 3, 1871, disclosed the fact that evidence as to the character of the actual land now claimed by the Golden Center company was adduced, but held, nevertheless, that the decision was not binding upon the applicant company. The Secretary defined the law thus: the Department, in order to acquire jurisdiction to determine the question as to whether or not a known mine, or known mining possession, existed at date of townsite entry, must have a mineral application for land within the townsite pending accompanied by an application for a hearing to determine the question as to whether there was a known mine, or known mining possession, in existence at the date of the townsite entry. In accordance with the said decision of the Secretary in said case, the local office ordered a hearing for the purpose of permitting the Golden Center company to introduce evidence for the purpose of showing whether or not the mine claimed by it in the said townsite of Grass Valley was a known mine or known mining possession on June 18, 1869, the date of said townsite entry.

This hearing was recently heard, the City of Grass Valley, appearing in opposition thereto, and the case will probably be determined by the local officers at Sacramento in the near future.

So far as your correspondent knows this is the first

case of its kind to be taken into the Land Department, affecting a townsite patent in central California; all others have gone the way of the local courts. A. R. Tabor of Sacramento is the first attorney to follow the procedure described above and a successful termination in his favor will result in considerable townsite litigation.

ANYOX, BRITISH COLUMBIA

DOLLY VARDEN DISPUTE ENDED.—GRANBY STARTS ITS BY-PRODUCT COKE-OVENS.

The Taylor Mining Co. has been incorporated with a capital of \$1,500,000, and has taken over the Dolly Varden mine, at Alice Arm, thus ending a legal squabble that has moored this valuable property for a considerable period. Briefly, the dispute was between the Dolly Varden Mines Co. and the Taylor Engineering Co., the latter having constructed a railway along the Kilsault river to connect the mines with tide-water at Alice Arm, which the mining company was unable to pay for. After a protracted fight, fraught with legal technicalities, the two companies placed the matter in the hands of a legislative committee, which gave the Dolly Varden company 10 days in which to pay off the wage claims, amounting to \$134,600, and 30 days, after a full accounting had been taken, to pay off the engineering company's debt of \$462,500. In the event of failure on the part of the mining company, the committee gave the engineering company leave to pay the wages and take over the property, paying \$200,000 in floating charges and indemnifying the shareholders of the mining company out of profits from the mine. The Dolly Varden company admitted the Taylor company's claim, but defaulted on payment, so the Taylor Mining Co., a subsidiary of the Taylor Engineering Co., was formed, and has paid the wage claim and taken over the property. It is gratifying to notice that the staff of the new company, which already has proceeded to the mine, is composed mainly of returned soldier-miners. [Their names are given in the personals of the 'Press' of July 5.]

The Granby Consolidated company started its new by-product coke ovens at Anyox during the visit of the president, W. H. Nichols, who has just returned from the property. The ovens were designed during the War with the view to saving, among other by-products, toluene and benzol for munitions, and it is claimed they are the only ovens of the kind on the Pacific Coast. The tar will not be treated at Anyox, but will be shipped to Vancouver, where re-distillation products will be saved and manufactured. Coal is being supplied to the ovens from the Granby company's newly-developed areas at Cassidy siding, near Nanaimo. Owing to the strike at Crow's Nest Pass, the Granby company's Grand Forks smelter is nearly out of coke, and it is feared may have to close. Considering the longshoremen's strike, it is doubtful if the Anyox ovens will be able to save the situation. The Vancouver authorities seem to have the strike well in hand; while it is causing inconvenience, it is not causing any serious hardship.

Black blasting powder is now quoted in California as follows, from June 24:

Carload lots (minimum 800 kegs), \$1.70 per keg; 100-keg lots, \$2; 10-keg lots, \$2.10; and under, \$2.25 per keg. This is a general reduction of 20 cents per keg.

In Technical Paper 223 of the U. S. Bureau of Mines, just issued, mine-owners will find a good deal of interest in 'Cost Keeping for Small Metal Mines', by J. C. Pickering. Included in the 43 pages are specimen charts and tabulated reports, these and the methods being modifications of practice at mines with which the writer has been connected. Accounting is not discussed, as it is not within the scope of the discussion.

ALASKA

The Alaskan Engineering Commission has reported to Congress that the Government railroad will be completed in 1921, at a total cost of \$50,436,971, or about \$73,200 per mile. L. J. McPherson, engineer in charge, said that this cost compared favorably with American continental construction costs. It is proposed to employ between 5000 and 6000 men this summer.

The President has signed a proclamation by which 307,800 acres of land are eliminated from the Chugach national forest. The land consists of two separate tracts, one known as the Ship Creek area near Anchorage, containing about 109,300 acres; the other is a strip of national forest land three miles wide between the Fox and Kaslof rivers, amounting to 198,500 acres. Much of the eliminated land is reported by the Forest Service examiners to have agricultural possibilities. This is the second large elimination from Alaskan national forests made as a result of the land classification work done by the Forest Service. In 1915, the Chugach forest was reduced by nearly 6,000,000 acres. The present elimination brings the forest down to approximately 5,500,000 acres, with a stand of between 7 and 8 billion board feet of timber, much of which is valuable for airplane stock and paper-pulp.

ARIZONA

Clifton.—The Arizona Copper Co. has purchased the entire holdings of the Shannon Copper Co. The latter's holdings in the Clifton district approximated 1000 acres of mining land, together with a smelter and concentrator. A number of the claims of the Shannon company were contiguous to the Arizona property, and part of that now acquired was sold to the Shannon company by the Arizona company a few years ago. Extensive tests are being carried out at No. 6 concentrator at Clifton on the low-grade ores of the Shannon. This work is meeting with success. The Shannon smelter is to be scrapped.

Jerome.—At a recent meeting of directors of the Verde Squaw Copper Co. it was decided to resume operations. It is believed that the first operations will be confined to drilling.

Tucson.—The War Minerals Relief Commission has completed three days of interviewing claimants. Arizona's claims are practically all for manganese and tungsten. The Commission, during its stay here, made its headquarters at the office of the Arizona State Bureau of Mines, University of Arizona.

COLORADO

Breckenridge.—The three dredges of the Tonopah Placers Co., one of the Powder River Gold Dredging Co., and one of the French Gulch Dredging Co., are digging a total of 16,000 cu. yd. of gravel daily.

Denver.—The new Commissioner of Mines, H. F. Lunt, with James Duce, oil inspector, and James Dalrymple, coal mine inspector, have gone to the 'western slope' to inspect the State's oil-shale beds and report on the probable cost of developing the local industry. The data collected will be published in a bulletin to be issued by the Bureau of Mines. Besides obtaining information regarding the commercial possibilities of the shale, the Commission will make a study of the safest and most efficient methods for mining it. At the same time as this investigation, three field parties, under direction of R. D. George, State Geologist, are to make an oil and shale survey. These parties will be in charge of the assistant geologist, R. C. Coffin, and Mr. George.

The fifteenth biennial report of the State Bureau of Mines for 1917 and 1918, in charge of Fred Carroll, commissioner recently resigned, has been issued. The book contains 206 pages, covering all matters pertaining to mining in Colorado. The four district inspectors are T. R. Henahan for Denver, M. J. McCarthy for Cripple Creek, R. J. Murray for Leadville, and Robert Innes for Durango. J. T. Duce is chief clerk at Boulder. The Bureau costs \$34,800 per annum. The accident record for 1917 was 56 killed and 713 seriously injured, and for 1918, 47 and 628, respectively; in 1916 the figures were 69 and 742. The principal events in the various districts are briefly discussed, while the rarer ores are given a fair amount of space. Some new maps would have improved the different reports. Arthur J. Hoskin covers oil-shale; and C. W. Henderson, of the U. S. Geological Survey, the 42 pages of statistics. Since 1858, Colorado has produced metals valued at \$1,405,484,255, gold accounting for 44%, silver 34%, lead 12%, copper 2.5%, and zinc 7.5%.

In the case of the City Bank & Trust Co. (closed), its cashier (R. A. Brown), and the president of the Colorado Pitchblende Co. (J. S. Barnhill), the cashier surrendered on June 26. He said that he had been to Rico. He was charged with grand larceny of a check for \$20,000, pleaded not guilty, and was released on a \$1000 bond. The bank's books show a shortage of \$140,000. There is nothing to report regarding affairs at Boulder.

Gateway.—Paradox Valley shows increasing activity as the season progresses. A shortage of miners still handicaps operations. The weather is favorable for good roads. A survey is now under way for a road from Gateway to the valley, opening an outlet to Grand Junction, and making a short route to the East, over a standard-gauge line, with lower freight rates. There is no doubt but that the road will be built, as interests along the route are making a strong petition for it. As an example of the great transportation expense borne by local operators, the Radium Luminous Material Co.'s problem is typical: The workings are 58 miles from the Rio Grande Southern railroad, a narrow-gauge line; 3½ days are required for a trip with 6-horse teams. Upon delivery at rail there is a haul of several miles

over narrow-gauge lines to Alamosa, where there is a transfer to the standard-gauge road. The ore is shipped to the reduction plant of the company at Orange, New Jersey. Some of the ores of this part are sent out by way of Ridgeway and Montrose; but in either event there is a transfer from narrow to standard-gauge.

The Standard Chemical Co. has leased part of a local coal mine to furnish its reduction plant with a regular and cheaper supply. A cut-off on the road to the workings will shorten the round-trip haul by 15 miles.

The Colorado Vanadium Co. is planning the construction of a large mill at Fall creek to treat the output from its extensive holdings at Bear creek, and along the San Miguel. The company has leased the Summers mill at Sawpit and will remodel to treat vanadium ore temporarily.

Leadville.—The Mt. Champion gold mine is to resume operations at an early date.

The Bohn and Northern mines continue to produce manganese, but their contracts expire soon, yet it is expected that they will be renewed.

Rico.—There is said to be a shortage of miners in this district. A clearing-house has been decided upon, and a bulletin board at the 'Item' office will contain the names of the companies waiting men.

Silverton.—The Sunnyside M. & M. Co. has decided to commence building operations immediately. The boarding and bunk-houses will be at Midway, at the upper workings, and are to provide accommodations for 150 men. The new structures will be of steel and corrugated iron construction. A new compressor plant will also be built. During the next four months, the principal operations will be sinking the Washington shaft to the Terry tunnel, a distance of 600 ft. Milling operations are to be resumed in the near future.

Telluride.—Production from this district is not heavy, as many men are engaged on development, and getting out ore for shipment at a later date. A shortage of miners continues, notwithstanding the fact that the wage-scale is high.

All production from the Black Bear property of the Smuggler Union has ceased, and men are sinking the main shaft to a depth of 800 ft., preliminary to opening larger areas of stoping ground.

The Smuggler Union is enlarging all boarding and bunk-houses in anticipation of a greatly increased force of men. A new structure will be an apartment house to accommodate families.

The Old Smuggler mill is now under lease to a company that is working over the mill waste. As there is an accumulation of 25 years, and as there is reported to be good value in this product, it is probable that the leasees will make a good profit.

The Tomboy Gold Mines Co. reports satisfactory progress at the new flotation plant.

IDAHO

Kellogg.—The Bunker Hill & Sullivan company's saw-mill and immense stock of lumber here have been burned. Although in danger for a while, the new concentrating plant was not damaged. The loss was estimated at \$200,000.

Kellogg.—The formation of a mining company which expects to spend about \$40,000 in development near here within the next few weeks, is announced by E. O. Conner, one of the incorporators. The organization will be known as the Great Dunker Mining & Milling Company.

Wallace.—Black Bear has had a change in directorate. Work, suspended since 1915, will be resumed. A good deal of lead-silver-zinc ore is said to be available.

KANSAS

Baxter Springs.—Production of this field last week was 1776 tons of blende and 136 tons of lead, valued at \$82,730. The output is well maintained.

MISSOURI

Joplin.—Many miners in the Tri-State zinc-lead region have gone to harvest crops, and will be away a month or more, leaving the mines short of men. The stock of blende on hand is estimated at between 15,000 and 25,000 tons. Production is 8000 tons per week and sales about 11,000 tons.

MONTANA

Butte.—The East Butte smelter expects to receive 400 tons of ore daily from the Colorado mine of the Davis-Daly company, when work is resumed there. Davis-Daly at present is shipping 100 tons daily.

Butte & Superior is soon to start deepening its No. 2 shaft from the 2050-ft. level.

Anaconda pays \$1 per share, equal to \$2,331,250, on August 25.

The safety departments of mining companies in this district held a big field day on July 4, similar to that of last year. The first-aid demonstration was the feature of the day. The program also included drilling contests, running, boxing, two brass bands, and free refreshments to all persons. John L. Boardman was chairman of the arrangements committee.

Helena.—On June 21 another meeting was held here to complete organization of the Montana Mining Association, which aims to promote development of the mining industry of the State. Membership of the committee is: on membership, Sam D. Goza, Helena; publicity, Charles D. Greenfield, Helena; finance, George L. Ramsey, Helena; smelting and ore dressing, Charles E. Fryberger, Helena; labor, Senator Page of Granite county; legislative, W. J. McCormick, Missoula; Government bulletins and geological surveys, L. S. Ropes, Helena; transportation and roads, Paul Pratt of Lincoln county; and grievances, Alexander Leggat of Butte.

NEVADA

Rochester.—The Nonpareil Mining Co. has been formed to operate the Nonpareil claims on the west side of Lincoln hill. L. T. McAtee of San Francisco, is president, and M. Helliere of Reno is secretary. The ground adjoins the Lincoln Hill group, and has produced \$30,000 in gold.

Tonopah.—Some of the yields for May were as follows: Belmont—8916 tons for 100,051 oz. of silver and 1036 oz. of gold, with \$56,407 profit. Extension—8866 tons for 108,876 oz. of silver and 1019 oz. of gold, with \$56,458 profit.

On July 4 there was held here a jack-hammer drilling contest, also competitions between shovelers.

OKLAHOMA

Picher.—Production of this district last week was 4858 tons of blende and 854 tons of lead, valued at \$257,276. The Picher mines yielded 1100 tons of blende and the Bilharz 501 tons.

TEXAS

Terlingua.—The Louisiana-Texas Quicksilver Co., composed of Louisiana people, has acquired 8960 acres of land in this district. Development will begin at an early date, partly by core-drilling. A 100-ton retorting plant is proposed. E. A. Waldron of El Paso put through the deal.

UTAH

Bingham.—The Montana-Bingham resumed operations on June 1, after a shut-down of four months. Lessees during this period shipped some high-grade lead and copper ore.

Eureka.—The East Tintic district is busy. There are 15 new shafts being sunk, and an equal number contemplated. The Copper Leaf is down 1200 ft. J. W. Taylor is in charge. —The Iron King has just put in an electric hoist for its 1200-ft. shaft. N. W. Roberts is superintendent.—The Big

Hill group of the Jesse Knight interests are being prepared for development in charge of H. W. Trenholm.

Tintic.—The Eureka Bullion company, managed by J. M. Bestlemeyer, has opened rich ore on its 800-ft. level. At a point 630 ft. in, 2 ft. of 8-oz. silver and 4% lead ore was cut. A cross-cut was then driven 80 ft. back from the face, finding 4 ft. of ore assaying from 9 to 20% lead, 23 to 71 oz. silver, and \$2 to \$2.40 gold per ton. Carbonates and sulphides have practically united at this depth. In other mines of this district, these ores are found in different zones.

WASHINGTON

Leadpoint.—The Electric Point Mining Co. is to erect a power-plant, and has let a contract for excavating.

Loon Lake.—The Loon Lake Copper Co.'s new 75-ton concentrating plant is in operation, in charge of W. L. Ziegler, who has installed flotation machines of his own design. Included in the expenditure of \$50,000 is a 6-drill compressor, 50-hp. engine for hoist, 200-hp. engine in the mill, two 4 by 4-ft. ball-mills, two drag classifiers, thickener, two 5-cell flotation machines, and a 4-ft. filter. Dump ore, carrying 2.5% copper and $\frac{1}{2}$ oz. of silver, has given a 92% recovery. Ore-reserves are estimated by C. J. Stone at 28,000 tons. Thirty-five men are employed.

Republic.—The Lone Pine-Surprise has opened the ore-body at 650 ft. depth for a length of 50 ft. It averages 6 ft. across, of good value in gold. Shipments are made to the smelter at Tacoma. C. P. Robbins is manager.

CANADA

British Columbia

Britannia.—The Howe Sound Co. pays 5 cents per share on July 15. This amounts to \$99,207.

Hedley.—The Hedley Gold Mining Co. paid 10 cents per share on June 30. This is equal to \$12,000, making \$24,000 for 1919 and \$2,436,000 to date.

Sandon.—The tramway for the Wonderful mine, near this place, is complete. It is about a half-mile long, and has one span of over 1000 ft. without a tower, one of the longest spans of the Ainsworth-Slocan district.

Construction of an aerial tram from the Sovereign mine to Sandon is in progress, the work being in charge of Irwin White. The Sovereign is one of the Cunningham properties, and its ore will be treated at the Alamo concentrator. It is reported that the Alamo mill is almost ready for operation. Completion of the pockets and the elevating plant for the handling of ores from the Sovereign and Wonderful mines will put the concentrator in shape for work.

Trail.—Consolidated Mining & Smelting paid a dividend of 2½% on July 2. This is No. 33, the regular quarterly, and is equal to \$261,936, and makes \$785,808 for 1919.

Ontario

Cobalt.—Nipissing vein 109 has been one of the most important developments in this field for a long time. For 130 ft. the shoot was 2 in. wide, averaging 3000 oz. of silver per ton. In a circular, dated May 24, the company stated that it had acquired on favorable terms an important interest in approximately 1000 acres of undeveloped land about four miles south of the Petrolia oil and gas field, 20 miles south-east of the Burkburnett oil-pool, and almost due north of the Ranger oilfield of Texas. As soon as possible, and probably within 30 days, the drilling of a well will be started. The results of the operation will be given shareholders without delay.

Kirkland Lake.—Mine managers and the Union were to meet here on the 19th to discuss the strike. The Lake Shore, Tough-Oakes, Wright-Hargraves, Teck-Hughes, Elliott-Kirkland, Kirkland Lake Gold, and others are all closed. The meeting between mine-owners and workers on June 21 was fruitless.

Porcupine.—The Hollinger paid a dividend of 1%, \$246,000, on June 17. This is the third for the current year, and makes \$10,162,000 to date.

MEXICO

Business men who recently participated in a trade excursion into Mexico [from San Antonio, Texas] are not inclined to favor the immediate investment of capital in that country. Banking facilities were found to be unsound; transportation was suffering severely from the lack of rolling stock; and manufacturing, smelting, and mining industries were operating on part time. A visit was made to Tampico, where the oilfields were shown to be unsettled. The excursionists were everywhere given a courteous and cordial reception. Crops seemed to be good, and it was reported to members of the party that they were better than they had been for several years past. These statements are taken from a report made to the National Association for the Protection of American Rights in Mexico (head office in New York), by a member of this trade excursion who writes that "the conditions in Mexico are still far from normal, but sufficient improvement has been noted during the last few months to warrant an effort toward establishing more active commercial relations. The majority of the excursionists, however, are not inclined to favor the immediate investment of capital in Mexico. They believe a better plan is to cultivate closer social relations with the Mexicans, study their needs and customs, and lay the foundation for the business which they feel certain will come from Mexico."

Baja California

Santa Rosalia.—The Boleo Copper Co., controlled in France, has curtailed its mining and smelting operations on account of the copper market. It recently laid off several hundred of its 3800 employees and closed some departments at the works. This company has carried on extensive operations in Lower California for many years. The mines are extensive. Being remote from the remainder of Mexico and the United States, little public information has been available. It is known, however, that there has been no interruption to operations during the years of revolution in Mexico and the war in Europe. The smelter output is shipped in the company's own vessels direct to France. Santa Rosalia has no railroad outlet. The town is practically owned by Boleo Copper Co., and is said to be modern and well kept. This company is noted for the high wages which it pays, the scale ranging from \$2.50 to \$9 per day, United States currency. At various times the different revolutionary factions tried to foment trouble among employees, but on account of the high wages and general contentment all efforts of this kind proved futile.

Hidalgo

Pachuca.—Santa Gertrudis, during the first quarter of 1919, treated 98,012 tons of ore, yielding bullion valued at \$1,100,000, of which \$345,000 was profit. The mill worked at 95.1% of capacity. Exploration covered 1854 ft., of which 665 ft. was in pay-ore. In the west end of the mine, parallel 1120, at 75 ft. above the 5th level, an ore-shoot has been opened for a length of 109 ft., averaging 2.47 dwt. gold and 23.2 oz. silver, for a width of 4.7 ft.; a raise put up at parallel 1128 to a height of 56 ft., averaged 3.93 dwt. gold and 31.6 oz. silver, for a width of 4.4 ft. At the mill the steel crusher-bin extension was partly erected; foundations for the mill-bin extension and for the Hardinge ball-mill were built. The vacuum filter-plant for clarifying solution was nearly completed. Four additional Dorr type agitating tanks were partly erected. Another Merrill slime filter was received and installed, making a total of eight presses, this completing this extension.

In El Bordo mine there was 2024 ft. of work done, 408

ft. being in pay-ore. The more important results were:

| Vein | Level | Length, ft. | Width, ft. | Average assay | |
|------------|-------|----------------|---------------|---------------|----------------|
| | | | | Gold, dwt. | Silver, oz. |
| No. 1..... | 465 | 24.9 | 3.3 | 4.21 | 72.5 |
| No. 1..... | 465 | 9.8 | 6.9 | 1.64 | 17.8 |
| No. 1..... | 500 | 68.1 | 5.1 | 4.42 | 51.8 |
| No. 1..... | 500 | 47.9 | 6.0 | 3.54 | 44.4 |
| No. 1..... | 500 | 27.9 | 4.1 | 3.15 | 35.5 |
| Main | 525 | 32.4 | 6.2 | 4.77 | 56.8 |

The first three are drifts, the others are raises.

Construction of the aerial tram to the Santa Gertrudis mill is progressing satisfactorily, and, depending upon deliveries of tramway equipment, shipments of which are coming forward fairly regularly, should be completed in August.

Jalisco

Hostotipaquillo.—The Amparo Mining & Milling Co. is

PART OF WESTERN MEXICO

treating 11,000 tons of ore per month in the cyanide plant. Apparatus is being installed to bring the capacity up to 15,000 tons. The Amparo has a better grade of silver ore on the lower levels than in the upper levels.

Cinco Minas is treating 17,000 tons of ore per month by cyanidation. They recently installed two No. 86 Marcy mills.

El Favor Mining Co. has rebuilt 15 of its stamps, and expects to have the entire mill in operation by August. The stamp-department was destroyed by fire by bandits in 1917. They are now treating 50 tons per day.

Espada Mines, located near El Favor, has its cyanide plant completed. Motors arrived in April, and they will soon be operating.

Sinaloa

Culiacan.—There is a great deal of activity in the Sinaloa region, due to the high price of silver. Most of the ores in this district are either lead-zinc-silver or copper-silver ores, although there is considerable copper-gold. Practically all of these ores are good for flotation.

Cia. Minera Jesus Maria y Anexas, of San Jose de Gracia, is running at half capacity on gold ore. Flotation of dump tailing and current plate tailing has proved to be successful, and the company is installing additional K & K machines to bring the flotation unit up to 100 tons per 24 hours.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Fred. Hellmann is at Los Angeles.

William W. Mein is at Lake Tahoe.

A. Chester Beatty has returned from London to New York.

L. S. Austin has gone to Salt Lake City, from Los Angeles.

Arthur Lakes, Major in the U. S. Army, left France on June 17.

Edgar Rickard has left Washington and become a resident of New York.

F. A. Beauchamp has gone to Lark, Utah, and will be away two weeks.

Oscar Lachmund is examining the United Copper mine, near Chewelah, Washington.

Welton J. Crook is examining mines in British Columbia. He will be away for a month.

J. T. Shimmis has been appointed manager of the Arizona Hercules Copper Co.'s milling plant at Hercules, Arizona.

Charles W. Stimpson, of Salt Lake City, attended the Bohemian jinks and proceeded from San Francisco to New York.

G. C. Evans, metallurgist with the Oriental Consolidated in Korea for nine years, has been on a vacation in Australia, and returned late in May.

P. B. McDonald, formerly on the editorial staff of the M. & S. P., has been appointed Assistant Professor of English in the School of Engineering in New York University.

Van H. Manning, Director of the U. S. Bureau of Mines, received the honorary degree of Doctor of Engineering from the University of Pittsburgh at the Commencement on June 21.

J. E. Spurr has resigned as Executive of War Minerals Investigations, Bureau of Mines, to take effect July 1. The War Minerals Investigations work will be terminated on that date.

Richard Hamilton, general manager of the Great Boulder Proprietary mine at Kalgoorlie, which has produced gold worth £11,171,490 and paid £5,466,175 in dividends, has been re-elected president of the Chamber of Mines of Western Australia for the 22nd consecutive year.

The new staff at the Dolly Varden silver mine, Alice Arm district, British Columbia, now operated by the Taylor Mining Co., is **Major D. E. Young**, from the Provincial Forestry Commission, general manager; **Major Angus W. Davis**, of the Consolidated Mining & Smelting Co. at Trail, mine superintendent; **R. B. McGinnis** of San Francisco, assistant; **H. B. Browning**, formerly office manager for the Canadian Collieries Limited, chief accountant and storekeeper.

The following distinguished mining engineers were in San Francisco last week on the occasion of a meeting of the Arizonan Chapter of the American Mining Congress: **Louis S. Cates**, manager for the Ray Consolidated Copper Co.; **Norman Carmichael**, manager for the Arizona Copper Co.; **W. B. Gohring**, superintendent of mines for the Calumet & Arizona Mining Co.; **George Kingdon**, superintendent for the United Verde Extension Mining Co.; **A. T. Thompson**, of the Phelps Dodge Corporation; **F. W. MacLennan**, manager for the Miami Copper Co.; **Julius Kruttschmitt**, of the American Smelting & Refining Co.; **W. G. McBride**, of the Old Dominion Copper Co.; **J. A. Burgess**, manager for the United Eastern Mining Co.; **B. Britton Gottsberger**, of the Miami Copper Co.; and **L. O. Howard**, superintendent for the International Smelting Company.

THE METAL MARKET

METAL PRICES

San Francisco, July 1

| | |
|--|-----------|
| Aluminum-dust, cents per pound..... | 50—80 |
| Antimony, cents per pound..... | 8.50 |
| Copper, electrolytic, cents per pound..... | 19.25 |
| Lead, pig, cents per pound..... | 5.65—6.65 |
| Platinum, pure, per ounce..... | \$105 |
| Platinum, 10% iridium, per ounce..... | \$115 |
| Quicksilver, per flask of 75 lb..... | \$95 |
| Spelter, cents per pound..... | 8.50 |
| Zinc-dust, cents per pound..... | 9—12 |

Platinum held by the Government, amounting to 19,000 oz., is to be sold at \$105 per ounce. It is said that this quantity is only about 40% of that held. Jewelers have been rather short of the metal lately.

EASTERN METAL MARKET

(By wire from New York)

July 1.—Copper is moderately active. Lead is quiet but firm. Spelter is quiet though steady.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

| New York | | London | | Average week ending | |
|------------------|--------|------------------|--------|---------------------|--------|
| Date | Cents | Date | Pence | Date | Cents |
| June 25..... | 110.12 | May 20..... | 53.36 | June 25..... | 110.33 |

| " 27..... | 108.75 | " 28..... | 52.90 | " 27..... | 108.90 |
| " 28..... | 108.50 | " 29 Sunday..... | 53.27 | " 28..... | 109.43 |
| " 29 Sunday..... | 108.25 | " 30..... | 54.48 | " 29 Sunday..... | 111.98 |
| July 1..... | 107.87 | Holiday | 54.40 | " 30..... | 111.52 |
| Monthly averages | | Monthly averages | | July 1..... | 108.83 |
| Jan. | 75.14 | 1917 | 101.12 | July | 78.92 |
| Feb. | 77.54 | 1918 | 101.12 | Aug. | 85.40 |
| Mch. | 74.13 | 1919 | 101.12 | Sept. | 100.73 |
| Apr. | 72.51 | | | Oct. | 87.38 |
| May | 74.51 | | | Nov. | 85.97 |
| June | 76.44 | | | Dec. | 85.97 |

The Finance Member of the India Council, when introducing the financial statement for 1919-20, made the following remarks regarding currency: "In April 1918 the position was stabilized by our purchase of American silver. The reserves from which we were subsequently to draw had been held at the rate of \$1 per ounce, and that rate determined the price at which silver was sold to us, while our agreement with the United States government bound us not to buy any silver at a higher price while the Pittman Act remained in force."

Statistics relating to Indian trade, showing what proportion was transacted with the United States, are shown below (export figures include re-exports):

| American proportion, | | Average | | American proportion, | |
|---|---|-----------------|----|----------------------|--|
| % | | 1909-10-1913-14 | | % | |
| Imports | 3 | 297,231,000 | 8 | 1917-18 | |
| Exports | 7 | 149,411,000 | 13 | \$100,283,000 | |
| Net balance between India and United States in favor of India (about) | | 7,500,000 | | 13,000,000 | |

The total of \$13,000,000 (\$92,000,000) required by the United States for payment for goods purchased from India during 1917-18, indicates one of the reasons why the former assisted the Indian government to provide the supply of silver rupees necessary.

The stock of silver in Shanghai consisted of about 30,400,000 oz. in specie and 16,300,000 dollars on May 17.—Weekly (June 5) report of Samuel Montagu & Co., London.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. Prices, in dollars per flask of 75 pounds:

| Date | | June | | July | |
|------------------|--------|------------------|--------|------------------|--------|
| June 3..... | 95.00 | June 17..... | 95.00 | June 25..... | 95.00 |
| " 10..... | 92.00 | July 1..... | 95.00 | July 1..... | 95.00 |
| Monthly averages | | Monthly averages | | Monthly averages | |
| Jan. | 81.00 | 1917 | 103.75 | July | 102.00 |
| Feb. | 126.25 | 1918 | 90.00 | Aug. | 115.00 |
| Mch. | 113.75 | 1919 | 72.80 | Sept. | 112.00 |
| Apr. | 114.50 | | 73.12 | Oct. | 102.00 |
| May | 104.00 | | 84.80 | Nov. | 102.50 |
| June | 85.50 | | 94.40 | Dec. | 117.42 |

The New York quotation for quicksilver is \$95.

According to figures compiled by F. L. Ransome, of the U. S. Geological Survey, 3960 flasks of quicksilver was produced in the United States from January 1 to March 31, inclusive, 1919. Returns from 23 productive mines gave a total of 3924 flasks, and it is estimated that 36 flasks was obtained from two or three small mines in California and Oregon whose operators were not heard from. Of the total output, 4023 flasks is credited to California, 1698 to Texas, 193 to Oregon, and 46 to Nevada. No production was reported from Idaho or Arizona. The metal reported

on hand at the mines or in transit to market at the end of the quarter amounted to 4419 flasks. As was expected, the output during the first quarter of 1919 was considerably less than that during the first quarter of 1918, which was 8764 flasks. The decrease was 2804 flasks. Unsold stocks at the end of the first quarter of 1918 amounted to 2800 flasks, or 1619 flasks less than at the end of the first quarter of 1919. The average monthly price of quicksilver in San Francisco, as quoted in the 'Mining and Scientific Press,' for January was \$103.75, for February \$90, and for March \$72.80.

The falling-off in production is the result of a combination of causes, chief among which were a lessened demand for the metal and a consequent downward trend of prices, the continued high cost of labor and supplies, and the curtailment of underground exploration and development during the War, when energy was directed chiefly to immediate production. The price of quicksilver compared with the prices that prevailed before the War was still high at the end of the quarter, but not high enough to offset the general increase in the tenor of the ore immediately available and the high cost of mining and treatment.

On June 25, Representative Luffin of Massachusetts introduced a bill in the House imposing a duty of 35 cents per pound on quicksilver. The bill carries the same duty per pound of mercury content on ores or compounds of mercury or manufactured compounds. The bill was referred to the Committee of Ways and Means.

COPPER

Prices of electrolytic in New York, in cents per pound.

| May | 9.41 | 7.93 | 6.49 |
| June | 9.63 | 7.92 | 6.91 |

Zinc ore at Joplin last week averaged \$42 per ton, basis 80% metal. This is an increase of \$1. The Tri-State region sold 7706 tons of blende.

TIN

Prices in New York, in cents per pound:

| Date | | Average week ending | |
|-----------|-------|---------------------|-------|
| Jan. | 1917 | 1918 | 1919 |
| Jan. | 44.10 | 85.13 | 71.50 |
| Feb. | 54.47 | 85.00 | 72.44 |
| Mch. | 54.27 | 85.00 | 72.50 |
| Apr. | 55.83 | 85.53 | 72.50 |
| May | 63.21 | 100.01 | 72.50 |
| June | 61.93 | 91.00 | 71.83 |

All restrictions are off tin, and prices for 99% metal are 68 cents, and for pure metal 70 cents. Straits tin, delivery from importation, is 52 cents per pound.

Eastern Metal Market

New York, June 25.

The markets are all strong and firm but generally dull, except zinc. The price tendency in most of them is improved.

Antimony is quiet and unchanged.

Copper demand is light but quotations are nominally higher.

Lead demand is only moderate, but prices are firmer.

Tin market in the United State is now free, but prices for Straits have eased off.

Zinc is decidedly higher on heavy buying.

ALUMINUM

Virgin, 98 to 99% pure, is unchanged at 33c., New York, in wholesale lots for early delivery.

ANTIMONY

The market is quiet, with Asiatic grades obtainable at 8.25 to 8.50c., New York, duty paid, for wholesale lots for early delivery.

COPPER

The market is dull and not particularly active, but quotations are firm and higher, though nominal. This appears more or less paradoxical, but it is the real condition. Producers, large ones in particular, are expecting higher prices as a result of the signing of peace. These may not come at once, but already they are higher. Sellers are disinclined to sell ahead in view of the outlook and are firm in their ideas of values, even marking them up every day or two. The past week was rather quiet with quotations firm, but with the turn of the week they have advanced until today electrolytic copper is quoted and has been sold at 18.25., New York, for July delivery, with future positions nominally about $\frac{1}{4}$ c. higher. Lake copper is strong and hard to obtain for July delivery; the nominal quotation is 18.50c., New York. The strikes in the brass territories have interfered some with demand, but the general tone of the market is optimistic and strong. One large producer states that there has been only one thing that has prevented the market from going to 25c., that being the large stocks which he thinks have been considerably reduced. An important factor as to the future is the belief that a resumption of full, or nearly full, producing capacity would now be impossible because of labor. This is another argument for higher prices as well as the looked-for export demand as a result of peace.

LEAD

The outside market is again back to that of the A. S. & R. Co., at 5.15c., St. Louis, or 5.40c., New York. The market is quiet but firm. A little business has been done, and all the cheaper lots have again probably been absorbed. Some sellers report the outside market at 5.45c., New York, with sales made and expect an early advance by the A. S. & R. Co. The better tone to copper and zinc has affected this market.

IRON AND STEEL

Orders are coming in faster than they are being completed and the consequent accumulative bookings is tangible evidence of the continued improvement. Recognition is being accorded the old law of supply and demand. Output of steel is now at about 60% of ingot capacity, and the probability is that the June output will be fully 10% more than that of May. British steel prices continue to advance; rails are now quoted there at \$73.60 against \$45 here, and wages have increased 12 $\frac{1}{2}$ % and mill operatives now demand the 6-hour day. Germany has already commenced taking steel orders in neutral countries under British prices—"at figures

British makers cannot touch." Structural steel orders continue to grow, and the East is nearly abreast with the West in this line.

TIN

At last the tin market is an open one, so far as the territory of the United States is concerned. On Monday, June 23, George Armsby, chief in charge of tin, announced that all the allocated metal had been disposed of and that all restrictions on trading between consumers, dealers, jobbers, and smelters were immediately discontinued, and that licenses for the purchase of tin are no longer required. John Hughes, chairman of the sub-committee on tin, also announced on Monday that the American Iron and Steel Institute would continue to function until import restrictions were all removed, and also would act as an intermediary when desired as between those who have large stocks of tin to sell and those who desire to buy. The whole position is rapidly clearing up, and a world-wide open market may be in force very soon. Some insist that the actual signing of peace assures such a market, despite any attempt at control, and that tin stored in Canada may be imported from there. The actual market is quiet. There has been some buying for July shipment from the Straits at 51 to 52c., and import licenses have been granted for this. The inactivity has been a disappointment to the trade, however, in view of the better situation as to control. As to the market within the United States, Straits tin in consumers' hands has already sold as low as 70c., New York, which is now quoted as the market for spot delivery. That the high-priced metal should sell under the allocated price is not a surprise to some, who argue that consumers can afford to part with this metal at 70c. or less and buy tin for future shipment at 51 to 52c. and gain financially by the transaction. American pure tin is quoted on a parity with Straits at 70c., New York, and Banca for future shipment at about $\frac{1}{4}$ c. under Straits.

ORES

Manganese: Little business is heard of in high-grade ore. It is reported that about 40 carloads of low-grade ore, carrying 20 to 27% Mn, was recently sold to an Eastern steel company, the price involved not being revealed nor the use to which it is to be put.

Manganese-Iron Alloys: About 3000 tons of standard American ferro was sold during the past week at \$110, delivered, but the quotation is again back to \$125. It seems that one or two Philadelphia producers became frightened into the belief that British makers were about to take these orders, and so notified their American competitors of their lower prices and gathered in the orders. A change developed yesterday, and producers are generally again quoting \$125, delivered, on the 600 or 800 tons now remaining before the market. There is an inquiry for 500 tons of spiegel, but the market is quiet at \$28 to \$30. furnace.

Molybdenum: Inquiry is reported as heavier, but it has not resulted in much business. Quotations are nominal at 75 to 85c. per pound of MoS₃ in regular concentrates.

Tungsten: The question of a tariff on ores has been a prominent topic recently, but nothing definite has materialized. The market is quiet and normal at prevailing prices of \$7 to \$10 per unit. There has been no testing of the ferro-tungsten market. Tungsten companies will find much of interest in the Hearings before the Committee on Ways and Means—House of Representatives—on H. R. 4437, a bill to provide revenue for the Government and to promote the production of tungsten ores and manufacture thereof in the United States.

Book Reviews

Mine and Quarry Tools. Simplified system of sharpening and tempering. By E. W. Liljegrän. Pp. 16. Vest-pocket size. May be obtained by writing to the author at Medford, Oregon. Price, \$1.

Some useful hints will be found in this little booklet, the result of experience at mines. The subject is important, as the quantity of ore and rock broken depends largely on the manner in which the steel has been treated in the blacksmith-shop.

Prospecting for Minerals. A practical handbook for prospectors, explorers, settlers, and all interested in the opening and development of new lands. Seventh edition. By S. Herbert Cox. Pp. 260, ill., index. Charles Griffin & Co., London, 1918. For sale by 'Mining and Scientific Press'. Price, \$2.25.

To be candid about this little book, we might say that while it contains a good many practical suggestions, we do not agree with the preface to this last edition, wherein it is said that "revision does not appear to be necessary." On perusing the chapters covering chromite, sulphur, molybdenite, tungsten, antimony, and other minerals of much importance, we find that many of the great deposits are omitted, the tests are quite inadequate, and the uses of these products are not well explained at all. We are somewhat surprised that, considering the attention devoted to the non-ferrous and rarer minerals in recent years, the author and publishers did not look into this matter.

Mathematics for Engineers. Part I. By W. N. Rose. Pp. 474, ill., index. E. P. Dutton & Co., New York. For sale by 'Mining and Scientific Press'. Price, \$5.

This volume, which is Part I, is devoted to elementary and higher algebra, mensuration and graphs, and plane trigonometry. Part II will consider calculus, harmonic and vector analysis, spherical trigonometry, and kindred subjects. The book is designed rather as a reference book for the practicing engineer, whether he be college-trained or self-educated, rather than as a text-book for the student, although it would also be of considerable value in supplementing the ordinary textbook. While mathematical theory is expounded carefully, the practical application of that theory is kept ever to the front with problems to be solved that are really practical, not like the old-style 'clock' problems that many of us remember. The chapter-headings are: Aids to Calculation, Equations, Mensuration, Graphs, Algebra, Plane Trigonometry, Areas of Irregular Curved Figures, Calculation of Earthwork Volumes, Platting of Difficult Equations, Determination of Laws, and The Construction of Charts. The text, unfortunately, contains a number of typographical errors, which should be corrected in another edition. However, these are relatively unimportant, and the book in general will be useful both to the practicing engineer and the student.

Excavation; Machinery, Methods, and Costs. By A. B. McDaniel. Pp. 526, ill. The McGraw-Hill Book Co., Inc., New York. For sale by 'Mining and Scientific Press'. Price, \$5.

If it were not for excavating machinery, the 220,000,000 cu. yd. of material at the Panama Canal could not have been moved, nor could 35,000 tons of ore per day be moved from the Utah Copper Co. From the coolie shoveling earth into small baskets to the steam-shovel operator handling 6000 cu. yd. per day is a long step. The present volume is a revision and enlargement of the author's earlier volume on 'Excavating Machinery'. The same general arrangement is

followed in the first part of the new book, each kind of apparatus being discussed in turn, but, whereas in the earlier volume the description of each class of equipment was followed by examples of its practical application, together with cost data, all this information, along with a good deal more of the same kind has been placed in Division II in the present volume. The chapter headings in Division I are as follows: Tools for Loosening and Hand Excavation; Drag and Wheel Scrapers; Blade or Road Graders; Elevating Graders; Capstan-Flows; Power-Shovels; Scraper, Templet, Trench, and Wheel Excavators; Cableways; Dipper-Dredges; Ladder-Dredges; Hydraulic Dredges; Subaqueous Rock-Drills; Car and Wagon Loaders. Division II, as already noted, is devoted to the practical application of excavating equipment including cost data. The arrangement here is according to the kind of work rather than the machine used for doing it, the chapter headings being: Highway Construction; Railroad Construction; Reclamation Work (including both irrigation and drainage); Rivers, Harbors, and Canals; Municipal Improvements; Quarries, Open-Cut Mines, Gravel-Pits, Brick-Yards; Tunnels and Underground Mines. A curious omission is that no mention is made of gold-dredges, although a large part of both divisions is devoted to dredges. The book is well-illustrated, mainly from manufacturer's catalogues. It will be of value to anyone engaged in excavating work.

Mining Decisions

Status of Association Placer Locations Prior to Discovery

A question arose in the course of locating association placer claims in California as to the effect of a conveyance by the association locators to one of their number or to a stranger. The Supreme Court of California in the case of *Miller v. Chrisman*, 142 Cal. 440, held that the associates might convey to one of their number without defeating the association location, and in the later case of *Merced Oil Co. v. Patterson*, 153 Cal. 624, it was held that the same principle applied to conveyances by the associates to a third party. In order that there might be no doubt on this subject, Congress passed an Act on March 2, 1911, 36 Statutes at Large, 1015, providing that patent might issue to an individual or a corporation for the full area of 160 acres where such a claim had been located under the mining laws as containing petroleum, oil, or gas, and where the original locators had transferred the same to a qualified person or corporation prior to discovery of oil or gas, provided that the location was in all other respects valid and was not withdrawn from mineral entry.

In the case of eight locators filing on 160 acres of land as a placer oil claim, who wish to convey the claim to a corporation to develop it, the corporation can hold the claim as a single claim of 160 acres, and does not need to cut it up into eight 20-acre tracts. The recent case of *Union Oil Co. v. Smith*, 39 Supreme Court Reporter, 308, a case decided (March 31, 1919) by the Supreme Court of the United States, is similar. The Court there points out the character of the title prior to discovery.

It should be remembered that the mistake of having 'dummies' act as locators before conveyances to a corporation should be avoided. Each of the original associates should be bona fide interested in the location and receive valuable consideration for the transfer to the corporation. A location by eight individuals for the benefit of a corporation, the individuals merely acting as dummies and not receiving valuable consideration, has been repeatedly held to render the location invalid, at least as to everything except 20 acres, which a corporation can lawfully locate in a single location.

Dividends From Mines, United States and Canada

Note: Companies not included in the above list are requested to submit details. Changes in capitalization and new dividends will be entered on receipt of the information. This table will be published quarterly. Corrections are invited.

Company Reports

ST. JOSEPH LEAD CO.

This company has made application to the New York Stock Exchange for the listing of its capital stock, and its official statement contained some interesting data. The authorized capital is 2,000,000 shares, \$10 par, of which 1,409,466 have been issued. The company controls the Mississippi River & Bonne Terre Railway and the Bonne Terre Farming & Cattle Co. By June 1917 it had acquired the whole of the properties of the Doe Run Lead Co. The St. Joe company owns directly 6444 acres of lead-bearing lands, 4244 of which are in the Flat River-Leadwood district, and 2240 in the Bonne Terre. By acquiring the Doe Run, it also owns mineral rights on 7054 acres in the Flat River-Leadwood and Doe Run districts. The estimated developed ore-reserves are 19,450,000 tons, and undeveloped 15,525,000 tons. Three mills are operated—the Bonne Terre, Leadwood, and Rivermines—with capacities of 2000, 2000, and 4000 tons daily, respectively. The smelter at Herculeum, on the Mississippi river, has an annual capacity of 120,000 tons of pig lead. The output during the past five years was: 77,404; 84,356; 91,073; 94,820; and 79,620 tons of lead. The company also owns 1000 houses, tenanted by employees, and operates mercantile stores. Dividends since 1874 total over \$21,000,000, plus 25% from the amortization reserve and 208 1/2% as stock dividends. The net income from all sources last year was \$5,121,164. Dividends amounted to \$2,819,004. Current assets total \$5,493,191, and liabilities \$771,712. Working assets include \$481,946 for lead on hand and in process, \$1,651,038 for materials and supplies, and \$26,621 for net store accounts. The reserve for Federal taxes is \$2,000,000.

TENNESSEE COPPER & CHEMICAL CORPORATION

Property: copper mines, smelter, and acid-plants at Copperhill, Tennessee.

Operating Officials: A. L. Tuttle, general manager, M. A. Caine, assistant.

Financial Statement: the Tennessee Copper Co., which is the operating company of the Corporation, made a net profit of \$706,572 during 1918. The consolidated balance-sheet shows current assets to be \$2,669,252, and liabilities \$642,163. The net bonded indebtedness is \$1,453,391.

Dividends: No. 26 absorbed \$400,000.

Development and Mining: extensions totaled 2858 ft., mostly in the Burra Burra mine. This cost 20.17 cents per ton. Diamond-drilling in 21 holes amounted to 3579 ft., at a cost of \$2.539 per foot. The Burra shaft was sunk from No. 10 to No. 12 level. North and south drifts on No. 10 opened good ore. A brick change-house of 308-men capacity was erected. No. 7 level of the London mine opened well in the north. Not much work was done in the Polk County mine. Ore-reserves in all mines total 3,480,911 tons, of which 3,182,819 tons are in the Burra Burra, plus 134,910 tons broken in stopes. Mining cost \$1.3747 per ton.

Smelting and Production: the blast-furnaces reduced 568,131 tons of charge, using 32,584 tons of coke and 703 tons of pulverized coal (the latter being tried in one furnace). Smelting cost \$2.16554 per ton of ore smelted, and converting 1.061 cents per pound of copper. The company ore—402,071 tons—yielded 9,750,008 lb. of copper, plus 69,830 lb. from leaching flue-dust.

The two acid-plants made 283,092 tons of 60° sulphuric.

All costs amounted to \$4.49788 per ton of ore, equal to 18.526 cents per pound of copper. Powdered coal is being used successfully in the blast-furnaces.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

A LUBRICATED PLUG-VALVE

Standard plug-cocks and gate-valves on pipe-lines in mills, cyanide plants, and other works, are frequently the cause of much bother from becoming 'frozen', followed by their being broken. This happens in spite of grease and cleaning, and we have known of large plants where one man was kept busy doing this. Accompanying these notes is a diagrammatic view of a new, though thoroughly tested, plug-valve, the invention of S. J. Nordstrom, who was engaged in the design, construction, and operation of cyanide plants in Mexico. For over three years this valve has been

in use, particularly at Pachuca and El Oro. It has also been adopted as standard equipment at several plants in place of ordinary plug-cocks and gate-valves for cyanide solutions, slime, water, and air.

The basic principle of the Nordstrom patent is the combination in a plug-valve of lubricant conduits and a lubricant chamber at the base of the plug so positioned that when pressure is applied to the lubrication screw, this pressure operates to lift the plug from its seat and simultaneously to distribute lubricant over the bearing surfaces. A flexible packing is provided between the body of the valve and the cover. This packing also rests upon an anti-friction washer forming the thrust bearing of the plug. This thrust bearing is grooved concentrically to prevent

leakage. The flexible packing furnishes the necessary elasticity to allow the plug to be forced from its seat for the purposes of lubrication and to force the plug back into its seat when the pressure in the lubricant chamber is released. The position of the lubricating conduits and of the lubricant chamber are clearly shown in the illustration. A stop is cast as an integral part of the plug and cover and is so positioned that the lubricant conduits can never be exposed to the fluid passing through the valve. From the construction it will be evident that no matter how firmly the plug may be stuck to the body of the valve, when force is applied to the lubricating screw, a pressure is created in the grease-chamber at the base of the plug, and that this pressure must either raise the plug from its seat or else break the body of the valve. For greater convenience in assembling the valve, the cover-bolts are provided with slotted lugs and a special nut is used to prevent the bolts from slipping when tightened.

Suitable lubricants are supplied in the form of convenient cartridges, which fit loosely into the lubricant conduit when the screw is removed. Several grades of lubricant are supplied to suit the special conditions under which the valves may be used. For general purposes, the No. 1 lubricant will be found satisfactory, but The Merrill Company of San Francisco, part controllers of the patent, advises that its special lubricants should be used as directed for certain kinds of service.

An inspection of the various makes of standard plug-cocks, now on the market, will reveal the fact that the area of the opening in the plug is frequently no more than 60% of the area of the pipe. In other words, in many cases the effective area of a 3-in. plug-cock will only be equal to the nominal area of a 2½-in. pipe. All types of the Nordstrom plug-valve are so designed as to provide a full 100% opening in the plug. These plug-valves are made with a parallel opening through the plug to minimize the friction of flow and to increase the life of the valve. The flanged type of valve is constructed along lines that ensure a high hydraulic efficiency, and the firm recommends this type particularly where such efficiency is an object. The shank of the plug of all Nordstrom valves is finished and, when specified, wrenches will be provided. These wrenches fit snugly on the head and are held in place by means of a set-screw.

COMMERCIAL PARAGRAPHS

The Mexico Realty & Development Corporation and Arturo M. Martinez announce the opening of their offices at the Equitable building, New York.

The 'Standard' ball-mill is shown in a leaflet issued by Collins & Webb of Los Angeles. The 5 by 4-ft. is a popular size. It will crush 70 tons of sulphide ore through 30-mesh in 24 hours.

To keep pace with its rapidly growing business in the South-West, and to render to its many customers better service, The Paraffine Companies, Inc., recently moved its Los Angeles offices to 903 North Main street. Stocks of the

firm's products are warehoused in a large building adjoining the new office.

The Burrell gas-mask for industrial gas protection is briefly described in a booklet of **The Mine Safety Appliances Co.**, of Pittsburgh, Pa., for which **E. D. Bullard** of San Francisco is representative.

The Dorr Company, New York and Denver, has issued **Bulletin No. 13**, describing the Dorrco pump. This is a 16-page publication containing tables of dimensions, weights, capacities, etc., part lists, instructions for operating, and illustrations.

In **Catalogue No. 7**, the **Standard Spiral Pipe Works** of Chicago discusses its reinforced spiral pipe, with continuous interlocking seam, no rivets, and smooth inside; also its forged steel flanges. This firm also specializes in drop forgings. Price-lists are included.

The Sullivan Machinery Co. of Chicago announces the establishment of a new branch-office at Room 810 Park building, Cleveland, Ohio, under the management of **Ralph T. Stone**, for several years past sales engineer associated with the New York office of this company.

B. F. Wade, recently discharged as lieutenant in the U. S. Army, is now representing the **Redwood Manufacturers Co.** of San Francisco at Chicago with offices at 811 Lumbermans Exchange building. He was prior to the War chief engineer for the Redwood Manufacturers Company.

Paul M. Einert, aged 56, died suddenly on June 5, at his home in New York. He entered the accounting department of the **Westinghouse Electric & Manufacturing Co.** at East Pittsburgh in 1900. Since then he went to this company's foreign branches in France and England.

H. L. Garbutt, for the last six years manager of the line material section of the **Westinghouse Electric & Manufacturing Co.**, East Pittsburgh, Pennsylvania, has been appointed manager of the supply division of the Westinghouse San Francisco office.

In **Bulletins 48701-A** and **48713**, the **Sprague Electric Works** of the **General Electric Co.** describe and illustrate electric dynamometers and the adjustable loop system for overhead material handling machinery for terminal sheds, respectively.

In **Pamphlet No. 9-C**, the improved impact-screen for the wet and dry sizing of all kinds of materials is described by the **Colorado Iron Works** of Denver. The limits of these machines are about $\frac{1}{2}$ in. and 80 to 100-mesh. This company's screen is used in many large works making greatly varied products.

H. H. Hallowell, sales manager for the **Western Machinery Co.**, is touring Nevada, Utah, and other Western mining districts, visiting the various representatives of his company and appointing new representatives in open territories. He reports conditions throughout these fields as being favorable, and states that his company is securing good business for Western engines and hoists.

In its 48-page catalogue, No. 63, the **Armstrong Mfg. Co.**, of Waterloo, Iowa, for which **H. C. Kaufman & Co.** of Los Angeles are Western distributors, a great deal of useful information will be found on drilling machinery, tools, and supplies. A reprint of the notes of **W. R. Grunow** on churn-drill prospecting at Morenci, Arizona, where Armstrong drills were used, will be found in its **Bulletin No. C.D. 2**.

J. W. McCabe, who until recently has been district manager of sales for the **Chicago Pneumatic Tool Co.** at Buffalo, New York, has been appointed special representative for the company's foreign trade department, and will leave shortly

for an extended trip through the Orient, the Philippines, and Australia. **W. H. White** has been appointed acting district manager of sales at Buffalo to take charge of that territory during Mr. McCabe's absence.

The S. F. Bowser Co., Ltd., of Toronto, Ontario, manufacturers of oil-tanks, pumps, and storage systems, was organized as a Canadian company on April 1, 1919. The firm has for a number of years been manufacturing and selling these products under the control of the parent company at Fort Wayne, Indiana. The Canadian business has grown steadily, practically the entire Canadian trade being supplied from the Toronto factory. The company issues a monthly called the 'Bowser Boomer'.

The Minneapolis Steel & Machinery Co., of 154 Nassau street, New York, announces the expansion and development of the service of its office to facilitate the handling of domestic sales in the eastern part of the United States, and to serve the Eastern representatives of all clients. **J. A. Teach**, contracting, mechanical, and structural engineer, is now making his headquarters at the New York office. **C. W. Hadden** will continue his duties as export manager. This office is now prepared to design and quote on steel structures and mechanical equipment, and solicits inquiries. It is also prepared, and will be pleased to give complete information covering the Twin City products, including tractors, and conveying machinery.

The Genter positive thickener (patented) is described in a 12-page bulletin issued by the **General Engineering Co.** of Salt Lake City. This thickener effects a separation of the clear liquid from the thickened unfiltered material through a series of cylindrical filter elements, which are continuously held in submergence in the material to be thickened. The filter medium is kept free and cleansed of a minimum cake accumulation by filtrate counter-current, while both sides of the filter medium are kept in submergence in a pressure chamber. The capacity is from 0.3 to 0.8 gal. per sq. ft. per min., or for 1000 to 1200 tons of liquid per day about 400 sq. ft. of thickening area will be necessary, varying, of course, with the character of the pulp.

'Vulcan Soot-Cleaners for Return Tubular-Boilers' is the title of a new bulletin just published by the **Vulcan Soot Cleaner Co.** of Du Bois, Pa. This publication describes the model M front-end type and the model R rear-end type. Since 1906, approximately two million horse-power of return tubular and Scotch marine boilers of many different types were equipped with these two cleaners. The bulletin shows how the cleaner is installed in settings of typical construction. It gives the results of tests conducted by the engineering department of the University of Illinois and by the Iowa Soldiers' Home, at Marshalltown, Iowa. All engineers who are anxious to save coal, who operate tubular boilers, and who are troubled with soot, should have a copy of this bulletin.

The New York Testing Laboratories, which have been organized by **L. R. Seidell**, **G. B. Jack, Jr.**, and **H. H. Geist**, formerly chief metallurgist, assistant chief metallurgist, and chief chemist, respectively, of the **Wright-Martin Aircraft Corporation**, have in addition to their well-equipped laboratories at 354 Mulberry street, Newark, New Jersey, opened their New York offices at 74-80 Washington street. In addition to chemical and physical testing and micro-photography, this organization is specializing in the source inspection of materials, and as consultants in smelting, foundry, drop-forging, and heat treatment practices, and the metallurgical investigation of shop troubles. They are also making chemical investigation of various ores and mineral deposits, their application to industrial purposes, and possibilities of marketing same.

WHERE unfaltering, economical work must be done—Garford has won the confidence of thousands by giving dependable service and low ton mile cost.

OPPORTUNITIES

Under this heading announcements may be made of new and second-hand machinery or supplies, for sale or wanted. The cost is five cents per word, including address, one dollar minimum order. Remittances MUST accompany order. Copy must be received by Saturday for the following week's issue.

GOLD MINE BARGAIN—We control 75% of stock of a California mining corporation. Through the death of the manager and promoter, the lack of capital and knowledge of mining, we offer to sell this interest at half of the value of the machinery and plant, valued at \$30,000, throwing in the underground workings valued at \$35,000 and ore in sight estimated at \$20,000 to \$30,000. Here is a bargain. Don't answer unless you mean business. Address Opp. 1259, Mining and Scientific Press. 7-5

A CANADIAN MANUFACTURER of machinery for the use of contractors, miners, etc., is open to undertake the manufacture of any other machinery or device for the use of either contractors or miners, and invites correspondence with holders of Canadian patents, or with U. S. concerns desiring a Canadian manufacturing agency. Liberal inducements also offered for successful suggestions regarding machinery or other articles that can be manufactured and sold in connection with the above-mentioned lines. Address Opp. 1253, Mining and Scientific Press. 7-10

A PROSPECTOR AND CLEAN-UP MAN of 40 years experience wishes to form a business connection with investor or company; gravels, mill tailings, platinum, base ores; three probable dredging localities and the common metals and commercial minerals; excellent references. For terms address Opp. 1243, Mining and Scientific Press. eow-11

MINING ENGINEER, located in thriving town on Government railroad in Alaska, adjacent to large highly mineralized region soon to be opened by railroad, wishes financial assistance to investigate and acquire desirable prospect. References. Box 1654, Anchorage, Alaska. 7-12

OPPORTUNITY—Diamond drilling on a new basis of cost, saving you one-half to one-quarter over present methods. Guaranteed work with best up to the minute equipment, efficient and experienced help. Long experienced and enthusiastic customers. Write for information. H. D. Staley, 132 Lick Bldg., San Francisco. 11

DREDGE WANTED

Will purchase for cash, a second-hand dredge, electric drive, five to seven and one-half foot buckets. All machinery must be in A-1 condition. State particulars and where it can be seen.

Address Opp. 1262

POSITIONS WANTED

The cost of advertising for positions wanted is 2 cents per word per insertion, including address. Minimum order 50 cents. Replies forwarded without extra charge. Remittances must accompany order. Copy must be received Saturday morning for the following week's issue.

MASTER MECHANIC and chief electrician wants position; age 33; married; 12 years experience, construction and maintenance of mill, mine, power house, shops and foundry; technical and practical; speak Spanish; will go anywhere. Address PW 1263, Mining and Scientific Press. 7-12

AL SCOTCH ENGINEER, master mechanic and electrician open for engagement in charge of power plant, mill and mine work; long experience with steam, gas and Diesel engines; electric power plants and air compressors. Address Jas. Donaldson, 721 Dolores St., San Francisco, Cal. 7-12

ELECTRICAL ENGINEER, university graduate, desires position as chief with large mining and milling company; 5 years practical experience in installation and operation power plants, high voltage substations, outside distribution and motors; 2½ years mining; familiar with both trolley and storage battery locomotives; can supervise all electrical repairs; will go abroad; excellent references; single; age 30. Address PW 1260, Mining and Scientific Press. 7-12

THOROUGHLY CAPABLE mine superintendent and foreman, 17 years experience; desires position; can install and operate any kind and size of machinery and pumps; can sharpen steel and do some blacksmithing, frame timber and erect ordinary buildings at mines; been successful before both in handling men and getting results; can give references; go any place. Address PW, 1261 Mining and Scientific Press. 7-5

MINE SUPERINTENDENT open for engagement; technical man; ten years experience; best of references; San Francisco interview. Address PW 1249, Mining and Scientific Press. 7-5

MILL SUPERINTENDENT OR FOREMAN, experienced all-around millman, machinist and assayer; 25 years experience. Have well equipped assay outfit. Address PW 1250, Mining and Scientific Press. 7-5

POSITION WANTED, material agent and warehouse manager; nine years experience on mine construction and operation; best of references; go anywhere; age 34; married. Address PW 1258, Mining and Scientific Press. 7-19

MINE AND MILL SUPERINTENDENT, technical education, 25 years experience; thorough machinist and assayer, also thorough in mill construction. Address PW 1224, Mining and Scientific Press. 8-28

EXPERIENCED flotation mill superintendent and metallurgist open for engagement with reliable company. Address PW 1257, Mining and Scientific Press. 7-5

MINING AND SCIENTIFIC PRESS wants a permanent circulation representative in every mining community in the world. Replies will be held confidential if desired. Address, The Manager, Mining and Scientific Press.

Mine Sampling and Valuing

By C. S. HERZIG

A Discussion of the Methods Used in Sampling and Valuing ORE DEPOSITS, with Especial Reference to the work of Valuation by the Independent Engineer

420 Market St. Mining and Scientific Press San Francisco

For sixteen years we have supplied technical men to mining employers—superintendents, engineers, chemists, foremen, master mechanics, electricians.

The effectiveness of our service is indicated by the following excerpts:

"For many years this company has engaged most of its men through your agency. The absence of such an agency as yours would affect us quite seriously."

"The work you are doing is valuable to our industry. You have given us service in getting men that we would be at a loss to duplicate."

"In many instances in the past eight or nine years it would have been a very hard task for us to find the proper men for various positions, had it not been for your prompt and efficient services."

Remember—These statements come from the very largest mining companies in America. Write or wire your requirements.

FLOTATION

treatment of ores is most efficiently accomplished by the JANNEY MECHANICAL AIR FLOTATION MACHINES. The "Little" Janney belt driven is especially adapted for mills treating up to 100 tons per day and the "Standard" Janney for mills treating more than 100 tons per day.

THE JANNEY FLOTATION MACHINE

patented circulating feature insures the highest degree of efficiency, it increases the time factor by building up a large circulating load that passes the ore pulp many times through the machine. This gives a maximum extraction with the fewest possible number of machines.

We make a specialty of testing ores by flotation. Send for illustrated booklets.

GARRATT JACK HEAD PLUNGER PUMPS

Are Not Affected by
Muddy, Gritty Water

The cylinder has large clearance and the plunger is outside packed at the top. The suction and discharge valves are fitted with bronze taper seats and are easily exchanged by removing bonnets. The Jack Head works altogether on the down stroke; the pump rod is made to weigh just half the amount of pressure exerted on the plunger so that the load is equal and uniform at all times whether on down or up stroke. In this way

Balance Bob is Eliminated

thereby increasing the efficiency and materially reducing cost of installation. These pumps are made with capacities of from 30 to 500 gallons per minute and for elevations up to 600 feet.

W. T. GARRATT & CO.

Established 1850

299 Fremont St. San Francisco, Cal.

GIANT

*The proper use of
proper explosives*

Giant Explosives save time, money and labor in blasting because they are made especially to suit Western requirements.

As the Giant Line includes every type and grade of blasting agent, you will have no difficulty in securing exactly the right explosive for your purpose.

The extra care and skill employed in manufacturing Giant Explosives are your guarantee of their strength, stability and uniformity.

Ask the Service Division of this company how your blasting may be made more economical and efficient.

EXPLOSIVES

QUICKSILVER FURNACES

Your opportunity to market quicksilver at the prevailing market price is easily solved by the installation of a JOHNSON-McKAY FURNACE. These furnaces are successfully treating cinnabar ore on small properties where the cost of other types of furnaces would not warrant the outlay for first cost.

They are easily installed, operated at a minimum of cost, require no skilled labor and are capable of treating a considerable tonnage per day.

THE JUSTRITE GUN METAL CAP LAMP

No. 568. Gun Metal
Cap Lamp

This Lamp of sturdy construction in Gun Metal finish is one of the most popular types made.

— THE No. 51 — "JUMBO" HAND LAMP

—6 hour capacity—all aluminum lamp—the strongest lamp made.

Don't be content with the knowledge
you now have of your profession.

KEEP UP-TO-DATE

The world is progressing at a high rate of speed. New books are continually being published.

THE BOOK DEPARTMENT

of the MINING and Scientific PRESS carries a complete line of technical books on Mining, Mechanical, Electrical and Civil Engineering, Metallurgy, Assaying, Geology, etc.

Take Advantage of our Combination
Offer on the following page.

Standard Works *offered in* Combination

Six standard books, the latest editions, and the best in their fields, in combination with subscriptions to the MINING and Scientific PRESS at prices effecting a substantial saving over the retail prices.

ONE COMBINATION OFFER ONLY FOR EACH SUBSCRIPTION

Mining Engineer's Handbook

By ROBERT PEELE

2375 Pages, Index

This splendid handbook contains no discussion of abstract theory. Nothing but facts are found within its covers; not a surplus word, nothing of any consequence is omitted. It is a veritable encyclopedia.

Price \$5
Mining and Scientific Press one year... 4
\$9

Special Price for Both,
in Combination

\$8

Mineralogy, Blowpipe Analysis, and Crystallography

By G. M. BUTLER

155 Pages, Index

This is a handbook, just the thing for the pocket of the field man as a reference work, and equally valuable on the desk of the busy consulting engineer, mine manager and assayer. It is thorough, practical and confined to essentials.

Price \$3.50
Mining and Scientific Press one year... 4.00
\$7.50

Special Price for Both,
in Combination

\$6.50

Timber Framing

By H. D. DEWELL

275 Pages, Index

This book contains design and construction of head-frames, flumes, ore-bins, trestles, water-towers, mill-buildings and, in fact, all building incident to mining operations. A book for reference and study for those connected with construction work.

Price \$3.50
Mining and Scientific Press one year... 4.00

\$5.50

Technical Methods of Ore Analysis

By ALBERT H. LOW

374 Pages, Index

This is the seventh edition of this standard work, and is the last word on this subject. The chemist, mining engineer, assayer, and everybody concerned in the determination of the economic value of ores will find this book of great value.

Price \$2.75
Mining and Scientific Press one year... 4.00

\$6

Hydraulic and Placer Mining

By EUGENE B. WILSON

425 Pages, Index

This is the third and last edition (1918) and covers the essentials of the entire placer mining field. It is thorough, practical and gives due consideration to the apparatus employed. It is an invaluable reference book, and equally useful to those who desire to add to their knowledge of this branch of mining.

GRIND—don't CUT

You can grind rock or placer-ground faster than you can cut it; therefore, we use a shot-bit giving a grinding edge that fairly eats through the ground.

DOBBINS CORE DRILL

"KNOW THE TRUTH" about your property. It's easy. The Dobbins brings up clean cores fifteen and twenty feet long—and does it uniformly.

The Dobbins is in use the world over on every kind of rock or placer-ground. You can learn all about the Dobbins from one of our agents or

Write directly to us for booklet 16, mentioning the character of your ground.

Forget Belt Troubles

---when your plant is driven by WOOSTER BELTING

Eliminate shut-downs on account of belt troubles. Never has there been a more satisfactory or dependable belt than 'Wooster'. It is adaptable for both conveyor and transmission purposes. It is solid cotton-woven. There are no plies, laps, stitches or sections. It is absolutely uniform and of the same durability and strength throughout. Wooster fabric is thoroughly impregnated and saturated under pressure with an asphaltum solution. This makes it resistant to the action of moisture, alkali, acid or gas fumes—and gives it exceptionally long life.

Wooster is the ideal belt for mine use—it may be exposed to damp or heat without fear of injury. Underground—in the mill—in the smelter or out-of-doors Wooster can be depended to transmit a larger percentage of horse-power for a greater number of hours than any belt made.

IT'S A Longyear drill

Refinement in the smallest details is a characteristic of the Longyear drills.

This is a No. 2 drill equipped with Screw Feed Swivel Head, all gearing is of steel, machine cut. The hoist is of the internal geared type, the engine is duplex, with double-bearing cross-heads. Nothing has been neglected to make the Longyear drills the last word in diamond drills.

A Drill for Every Purpose

E. J. LONGYEAR COMPANY

Branch Office, Tucson, Arizona

MINNEAPOLIS, MINNESOTA

We carry in stock the latest books on engineering subjects. Here are a few of the best.

MINERAL DEPOSITS OF SOUTH AMERICA

By MILLER and SINGEWALD

Cloth \$5.00 598 pp.

Contains chapters on economic geology, mineral production, topographic and geologic features, distribution of deposits and details of each class of ore worked in Argentina, Bolivia, Brazil, Chile, Colombia, Ecuador, the Guianas, Paraguay, Peru, Uruguay, and Venezuela.

CHEMICAL ANALYSIS OF ROCKS

By HENRY S. WASHINGTON

Cloth \$2.50 271 pp.

NEW EDITION, REVISED, 1919.

A practical manual for Chemists, Petrologists, Mining Engineers, and others, dealing with a selection of methods for the chemical analysis of silicate rocks, especially of igneous origin. Contains five parts as follows: Introduction; Apparatus and Reagents; The Sample; Operations; Methods.

THE ZINC INDUSTRY

By ERNEST A. SMITH

Cloth \$3.50 210 pp.

Explains the following phases of zinc: history, rise and progress of production, sources of supply, marketing, smelting, other methods of production, physical and chemical properties, industrial applications, industrial alloys, commercial compounds, etc.

COMPRESSED AIR PLANT

By ROBERT PEELE

Cloth \$4.25 485 pp.

Divided into the following parts: (Part one) Production of Compressed Air. (Part two) Transmission of Compressed Air. Also special reference is made to Mine Service.

IF YOU ARE INTERESTED IN TESTING FOR
Bauxite,
Manganese,
Tin, Monozite,
Platinum,
Placer Gold,
the EMPIRE DRILL will help you.

The Empire Drill is the most accurate and cheapest apparatus for prospecting for these minerals.

It is simple, light and portable, and can be taken anywhere that a man can go.

It is used by the United States, English, Canadian and Russian Governments.

NEW YORK ENGINEERING COMPANY

2 RECTOR STREET

NEW YORK

8 cylinders, Model A. Capacity 25 tons per day. Our large models have capacities from 8 to 20 tons per cylinder.

The MEYER

DRY ORE CONCENTRATOR

A PROVEN SOLUTION OF THE DRY ORE CONCENTRATION PROBLEM

After years of experimental work on all the common and complex ores of Copper, Lead, Zinc, Tungsten, Iron, Silver, Molybdenum, Chromium, Manganese, etc., we are able to guarantee an average extraction of 85% and better of practically every kind of concentrating ores—whether Sulphides, Carbonates or Oxides—while over 90% is constantly being obtained on many ores.

**Compare These Figures With What
 Your Mill is Doing**

Our exhaust or vacuum principle is a radical departure from every other process of concentration. It is not only scientifically correct, but can be absolutely controlled to any desired suction, detecting the slightest difference in weight between the rock and mineral contents, producing a perfect separation and **Absolutely Dustless.**

Handles every size from largest to dust. Rotation of cylinders tumbles the ore and rock, the suction draws the rock upward farther with each rotation, while the heavier concentrates fall downward and out of the machine in a constant stream.

All metal construction. Add as many sections as desired.

Whether you have an abundance of water for wet concentration or are in the desert, the Meyer Dry Concentrator is worth your thorough investigation.

Send Us Prepaid: 10 lb. uncrushed run of ore; 20 lb. each of three sizes of crushed ore—coarse, medium and fine, as 16, 30 and 60 to 100 mesh; 15 lb. of unsized crushed ore. This saves unnecessary delay. Will return results—Then You Know.

Our catalog explains everything

PIPE

THE CHIEF CONSIDERATION OF PIPE IS
DURABILITY

National Pipe is uniform, ductile, spellerized, durable, thoroughly tested and inspected, made full standard weight, has high tensile strength, gives clean, strong threads. Two hundred ton stock to ship from, sizes from $\frac{1}{8}$ -inch to 10-inch.

Prompt and accurate service

SMOOTH-ON ELASTIC CEMENT No 3

**Stop
the
Leaks**

**Throw
the Can
away**

Leaks in flange-jointed pipe lines can be quickly and easily stopped with Smooth-On Elastic Cement No. 3.

If the leak is around the gasket, it can be remedied by pressing Smooth-On No. 3 in between the gasket and the flange. In the case of serious leaks, remove the gasket, coat both sides with Smooth-On No. 3 and replace.

If the leak is between the pipe itself and the flange, caulk in Smooth-On No. 3. The Smooth-On expands as it metallizes and makes a permanently tight connection.

For Sale by Supply Houses.

SMOOTH-ON MANUFACTURING CO.
ESTABLISHED 1893

BRAUN

K & K FEEDER

FOR OILS AND ACIDS

Feeding Difficulties!

In feeding oil for flotation purposes by means of a stopcock, a small grain of sand or dirt impedes the flow and causes inaccurate feeding.

Why not use the Braun K & K Oil Feeder which operates automatically and is not affected by foreign matter in the liquid. Set the machine once and as long as you keep oil in the tank, it's on the job twenty-four hours a day, seven days a week.

BRAUN K & K OIL AND ACID FEEDER

Adapted for Use with Any Standard Size
Flotation Machine

(Not a Laboratory Machine)

Made in two types—one for Oil and one for Acid. The Acid Feeder constructed of lead and bronze to withstand reagents.

Measurements: Length, 23 in.; width, 16 in.; height, 15 in.

YOUR "OVERHEAD"

B. & B. Aerial Tramways

reduce your overhead by operating overhead—by taking the direct bee line—by lifting your haulage off the earth, where it is affected by weather conditions, into the air where nothing affects continuous operation.

B. & B. Aerial Tramways are installed at reasonable cost. Up-keep is low. Economy is sure.

THE "WESTERN" POST BRAKE HOIST

EFFICIENT

STRONG

DEPENDABLE

"Western" Hoists are manufactured in sizes from 12 to 60 horse power, operating on gasoline, kerosene, distillate and fuel oils of low gravity. They embody practically every good feature found in other makes and many special features of distinct value which no other hoist possesses.

The "Western" Post Brake Hoist represents the greatest advance in hoist construction up to the present time. Adapted to any purpose where efficient, dependable and economical hoisting equipment is required.

BOOKS OF PRACTICAL USE TO MINING GEOLOGISTS AND ASSAYERS

New Editions 1918, Uniform Binding, 5x7. Price, \$3 each.

A Textbook of Mining Geology

By JAMES PARK

Contains chapters on Classification of Mineral Deposits; Ore Veins;
The Dynamics of Lodes and Beds; Ore Deposits Genetically Con-
sidered; Theory of Vein Formation; Ores and Minerals Considered
Economically; Mine Sampling and Ore Valuation; The Examination
and Valuation of Mines.

A Textbook of Practical Assaying

By JAMES PARK

Covers: Assay of Gold, Silver, Platinum, Mercury, Lead, Tin,
Antimony, Bismuth, Copper, Iron, Manganese, Ferro-Manganese,
Zinc, Chromite, Nickel and Cobalt Ores; Analysis of Limestone,
Dolomite, Magnesite, Calcareous Sandstones, Portland Cement, Meta-
morphie and Igneous Rocks, Coals, Sulphide Ore, Soils, Manure,
Water and Milk; Estimation of Alcohol, Sugar, Chlorine, Sulphur,
Sulphuric Acid, Phosphorus, Phosphoric Acid, Tungsten, Titanium,
Thorium, Molybdenum, Etc.

Every mine and mill
ought to carry a stock of

Put them on any piece of heavy duty machinery to replace the old double nut and washer arrangement.

You'll note the difference.

Drake Lock-Nuts stay tight. Patented features absolutely prevent them from working loose no matter how hard the strain or vibration.

Try them on your ball-mills, stamp-mills, air-drills, connecting rods, cross-heads, in fact any point where you've had trouble with the ordinary lock-nut method. You'll find they

"Never Jar Loose"

Drake Lock-Nuts are milled from the bar. There are no pins or drilled bolts—and no washers are used. Made from high-grade screw steel, perfect threads and careful finish.

Many large mines are using them now. They have ordered and re-ordered.

$\frac{1}{4}$ to 1" S. A. E.

$\frac{1}{4}$ to 2" U. S. S.

to 3" U. S. S. to order

Whitworth Standard Thread to order

Insist that the equipment you buy be finished with Drake Lock-Nuts.

The added cost is slight—the additional security is great.

LUNKENHEIMER

Lever Throttle and "Handy" Gate Valves

Provided with double discs having a ball and socket bearing at their backs, permitting the discs to be wedged between the tapered seats when valves are closed—a construction which experience has proven to be best for lever operated valves. It insures tightness with ease of operation.

Lever Throttle Valve "Handy" Gate

Valves are intended for steam and water lines, where the pressure does not exceed 75 pounds. Made in Bronze, sizes $\frac{1}{2}$ to 4 inches, in Iron Body Bronze Mounted, sizes 2 to 8 inches, and for handling Cyanides, Creosote, Alkaline Solutions, etc., is made in All Iron.

Your local dealer can furnish them; If not write us.

To Install Impact Screens is to handle a greater tonnage at a decreased cost

THE IMPACT SCREEN

The facts are given interestingly in Pamphlet 9-B
A post card brings a copy. It's distinctly worth getting.

Because the vibration keeps the meshes open. The character of the "impact" is different from that in any other screen, with the result that the Impact Screen actually accomplishes what has been long the attempt of screen builders. This clean screen surface insures great capacity in a small installation.

Because the characteristic vibration of the Impact Screen causes a classification of the material, the coarse working to the top, away from the wire cloth, the fine working to the bottom, where it should be. It is just what happens when pulverized material is placed in a box and the box rapped.

Because the vibration is not imparted directly to the wire cloth, which is inefficient and destructive of the wire cloth; but to a substantial vibrating frame to which the cloth is attached. When the wire cloth fails, it is from sheer wear, and practically the entire surface wears out at the same time. The Impact Screen excels all others in long life of screen cloth and low cost of upkeep.

COLORADO IRON WORKS COMPANY
New York Office 30 CHURCH ST. Ore Milling and Smelting Equipment Since 1860 Denver, Colo.

AS TO UPKEEP—

"Little Tugger" Hoists cost little or nothing for upkeep. They are so simple, rugged and so excellently built that this item is negligible. "Little Tuggers" don't break down, that's proven by a stack of service reports of machines applied to all sorts of work under all conditions.

There are places in your mine where a "Little Tugger" will speed things up and at the same time save you money.

THE PLAT-O TABLE

A New Concentrator for All Feeds From $\frac{1}{4}$ -in. to the Finest of Slimes

If a head motion is POSITIVE and needs absolutely no attention is it not better than no head motion?

The PLAT-O Self-Oiling Head Motion is Large and Strong and Needs no Attention Whatever

Here is what a user of the PLAT-O Head Motion has to say about it:

"Re your New PLAT-O Head Motion, I have the following to say regarding operation of same at our No. 5 Mill after a six months' test: We filled the head motion with oil the first day and have not had to put in any new oil after running six months, twenty-four hours a day, twenty-six days per month. We adjusted the head motion the first day and have never made an adjustment since."

Write for full particulars of the PLAT-O Table

MARCY MILLS AT INSPIRATION

Company of New York
holder.

Inspiration Costs Low

*Tribune Financial Bureau
Special Correspondent.*

BUTTE, March 12.—Inspiration copper costs last year were around 9 cents and tonnage costs around 60 cents. These compare with copper costs a pound for Anaconda of around 15 cents and more than \$3.50 a ton of ore. Inspiration costs are rated as the lowest in the country.

Clipping from N. Y. Tribune

COPPER mines in Australia are idle on account of the large stocks of the metal on hand. Only two of the larger companies are operating. Meanwhile the question is being raised in London as to whether copper should be imported into England from the United States to the detriment of the mining industry of Australia. It is suggested that a subsidy might be paid on Australian copper in order to assist competition with the American product, but we doubt greatly whether anything of the kind will be done, because such uneconomical production would be contrary to British ideas of free trade. Once the effect of peace has been felt in the re-establishment of industrial activity in Europe, the consumption of copper will provide a normal method of liquidating the stocks of metal in Australia and elsewhere.

GOLD producers in India, namely, in the Kolar district, to which the productive mines are confined, have been allowed by the Government to make an arrangement by which they sell about half their output for rupees and thereby save the loss in exchange involved in remitting the whole of the gold to England and then sending back the amount required to cover local expenses. On this the 'Financial Times' remarks: "This is a useful concession so far as it goes, but it tends to confirm the fear that the gold mines in general are not going to be allowed to make the big profit hoped for at one time out of the abnormal prices current in certain directions for the relatively small free supply of the yellow metal. It is said that in India and the Far East—that sink of silver and gold—the last-named metal has been fetching £1 to £2 per ounce over its standard price." Yes, a free market for gold and silver will best suit the miner, but what is spoiling the market for gold, of course, is the superabundance of paper money.

IN the article on 'Progress in Methods of Exploration' by Mr. Hugh M. Roberts, of Minneapolis, our readers will find an interesting discussion of the value of the diamond-drill as an instrument for finding ore and for ascertaining the dimensions of an orebody. Undoubtedly this method of exploration has gained in usefulness, not only because the tools needed for the purpose have been made more efficient, but because the mining engineer has learned to make correct deductions from the information obtained in the course of his drilling. Above everything the diamond-drill is a saver of time, which means money in enterprises involving large amounts of capital and engaging the services of an expensive staff.

One of the most striking demonstrations of the value of the drill in prospecting was made at Ajo, as Mr. Roberts points out, quoting Mr. Ira B. Joralemon's account of the work. As a sampling implement, the diamond-drill has proved useful, particularly in deposits that are low-grade and comparatively homogeneous, as in the disseminated copper orebodies of the South-West, but in precious-metal mining the drill remains a dangerous tool for sampling, except when used to a prodigal extent.

VARIOUS plans for restricting immigration are before Congress. One is the percentage plan for regulating the influx of foreigners into the United States. This is based on the proposal to permit the entry of only so many immigrants of each people or mother-tongue group as can be wholesomely Americanized, the number of those individuals of each group already Americanized becoming the basis of measure for the further immigration of their compatriots. As against the reasonable anxiety to exclude undesirable aliens, particularly anarchists and other subverters of orderly government, it is to be noted that large numbers of foreigners, that is, non-naturalized residents, are returning to Europe. In one day 5000 Italians left New York in three steamships. The monthly departures now exceed 30,000. It is reported that 25,000 passports are on file, approved, while the owners await space on outgoing steamers. From these departing aliens the Government has collected more than a million dollars in income-taxes since April. It is estimated that this exodus will include 1,300,000 aliens, who will take with them a total of about four billion dollars in savings. In the interval between July 1, 1914, and April 1, 1919—which covers the period of the War—the excess of immigration over emigration was only 514,812 persons, as compared with an excess coming this way of 1,764,934 in the two years preceding the War. If the earlier rate of immigration had continued we would today have 3,675,000 more people in this country than we have now. The subject is one of great importance. The United States was made by immigrants from other lands; its industrial prosperity depends largely upon an adequate supply of labor; yet every thoughtful citizen is anxious not to lower the standard of living or of life by admitting either the pauperized or the unruly elements from Europe. Much of our undesirable immigrant population was brought hither in the course of steamship competition that reduced the rates of passage to a minimum permitting the poorest and most ignorant to cross the Atlantic. The ordinary tests for political outlaws are

worthless, because anarchists and bolsheviks find no difficulty in complying with the requirements of Ellis Island, and, unless notorious characters, they cannot be spotted. We hope that Congress will go into this matter earnestly and carefully with a view not of closing the United States to the undeservedly unfortunate of other less favored lands but with the purpose of excluding those unable or unwilling to assimilate with our people.

DURING recent months we have criticized the enterprise of the Colorado Pitchblende Company and given reasons for doubting many of the optimistic estimates contained in the circulars and advertisements issued by that company in the course of its stock-peddling activities. The end has come rather sooner than we expected. On May 29 the State Bank Examiner of Colorado closed the City Bank & Trust Company's bank at Denver because of a shortage caused by the cashing of worthless drafts drawn by J. S. Barnhill, the president of the Pitchblende company, in collusion with Robert A. Brown, the cashier, and other subordinate officers of the bank. It appears that through promises of highly salaried positions in his mining company, Barnhill induced three of these officials to join in a scheme that finally rendered the bank insolvent. Cashier's checks were issued to Barnhill for large sums in return for drafts which he presented to a bank at Burley, in Idaho. At first these drafts were honored, but finally three of them, amounting to \$140,000, were protested, and the Denver bank was forced to close. The cashier's checks had all been made payable to the Western Union Telegraph Company and Barnhill had wired the money to some banks in Idaho. Warrants for the arrest of Barnhill and Brown were issued promptly, but both had gone to parts unknown. On June 26 the cashier surrendered to the sheriff at Denver. Barnhill is still at large. The metallurgical operations of the Pitchblende company during the interval have proved abortive. This fiasco should serve as a warning to the Colorado Manufacturers Association, which endorsed Barnhill's flamboyant advertisement and deprecated the criticism of domestic industry, even when technical men of good repute had gone out of their way to warn the public against buying stock in this unfortunate enterprise.

SEVERAL of our friends have received copy of the 'First Financial Report', being a prospectus issued by Mr. E. G. Lewis, of Atascadero, California. It is a pleasant-sounding address and Mr. Lewis has made a number of romantic statements quite in keeping with the Spanish names on his letter-head. The "report and statement," as it is called, gives "the results of my first year in mining," says Mr. Lewis. What is remarkable about the ornate and prettily illustrated pamphlet is the writer's confidence—after one year of experience—in his ability to tell the public what is a good mining venture, and, presumably, what is not. He amuses us by quoting one of our own remarks on mining speculation as a text at the head of his first chapter and by coupling it with

an aphorism by the late James J. Hill. He is modest withal, giving credit for his success in this "first year of mining" to Messrs C. E. Gilman and Granville Moore, gentlemen not unknown in San Francisco and Denver respectively. This ingenuous report is issued by Mr. Lewis for the purpose of selling some \$750,000 in bonds, on his personal note, in order to finance several projects that apparently need financial sustenance. The most curious item in the pamphlet is the description of a new ozone process, which is one more of those marvelous chemical methods which will treat every kind of ore in a jiffy and at a trifling cost. "A remarkable thing about the action of this new reagent," says Mr. Lewis, "is that not only are smelting ores thus treated in a few moments, but ores too refractory even for the smelter, are treated with equal success." Moreover, according to Mr. Gilman, the process "seems to have the power of dissociating atoms either chemically or mechanically combined." That is a fearsome feat. We do not wonder that it has been found necessary to remodel the plant. We see no reason why Mr. Lewis and his friends, all of whom seem to be honest, should not make experiments and even write about them, but until they know more about the technique of mining and metallurgy they should abstain from persuading an innocent public to embark with them in their South Sea enterprises.

Prohibition

See America thirst! The fateful first of July has passed and the water wagon becomes the symbol, the triumphal chariot, of a new morality. In those closing days of June when two great events were impending, peace and prohibition, it must be confessed that in this community the imminence of a 'dry' period stimulated more earnest conversation than the legal ending of a world war. The average man is more sensitive to anything that touches his personal comfort than to the meaning of even the most portentous events outside his individual experience. Therefore many of our citizens were greatly troubled, and in their trouble they talked a good deal of nonsense. For instance, they protested against the restriction of their personal habits as though it were contrary to the Constitution, the Ten Commandments, and the Fourteen Points. Is not the art of living in a community based upon all sorts of restraints and inhibitions of such personal conduct as might prove unpleasant or injurious to one's neighbors? Surely the whole idea of civilization is founded upon the self-surrender of the privilege to do as he pleased that man enjoyed during his jungle existence. He surrendered his 'natural' rights when he accepted the protection of the law. The notion of unrestricted personal liberty leads straight back to the unmitigated selfishness of savagery. In a democracy, which pre-supposes mutual consideration and a willingness to sacrifice freedom of individual action for the good of the whole body politic, it is absurd to exclaim at a restriction that has been approved by the representatives of the people after due and careful de-

liberation. Personally we are prejudiced against prohibition; as an individual we dislike it, because it debars us from beverages that were wholesome and palatable, but we bow to the will of the majority in this republic. At the present moment it is being shown again that the United States is a country of quiet majorities and vociferous minorities. The larger number of the American people desired prohibition, and they got it in a proper way through their representatives in Congress and in the State legislatures. The amendment to the Constitution may seem objectionable to some of us, but it will stick. No well informed person can imagine for a moment that there will be a speedy reaction against the law forbidding the sale of intoxicants in this country. The experience of the States that 'went dry' in advance of Federal prohibition is dead against such a hope. Where prohibition has been adopted, it is popular, for several reasons; it promotes thrift and increases business; it helps the women by preventing the men from squandering their wages; it is a factor of safety in the performance of dangerous work; it increases efficiency in every form of labor. These are real gains, against which the loss of sociability, the decrease of vivacity, and the deprivation of self-indulgence however harmless seem trivial indeed. It is true, of course, that to the average working-man an occasional drink is a counter-irritant when his temper is on edge, and it may be that an increase of unrest in the ranks of labor may ensue from the self-repression imposed by prohibition, but against this must be set the stimulation to disorder, especially during times of strike, caused by the excessive drinking of intoxicants, or, more often, by the moderate drinking of the poisonous stuff usually sold in the saloons of a mining settlement. New habits are not easily acquired by men no longer young, and for this we make due allowance. The weakness of the argument against prohibition is exhibited pathetically in the two articles, for and against, appearing in the current issue of 'McClure's' magazine, in which so clever a writer as Gertrude Atherton is able to present only the feeblest retort to Dr. Frank Crane's defence of the new law. The bugaboo of the drug habit is being raised by the very people who contend that prohibition cannot be enforced; they insist that the lack of drink will provoke the use of narcotics and in the same breath assert that the law against alcoholic liquor will be a dead letter. Our own opinion, backed by statistics, is that the decrease in drinking will cause a marked increase in the consumption of candy, because the human system needs some alcohol and will generate this requisite from the sugar that is eaten in various forms, such as the *eau sucré*, or sugared water, that many elderly Frenchmen sip habitually. An excess of candy will poison some people, as too much whiskey has poisoned others, but the results are not equally harmful, so let it go at that. Larger consequences impend. The annual expenditure incurred by the American people on account of spiritous liquors is about \$2,500,000,000. The Government will lose some \$440,000,000 in taxation, but the thrift induced by prohibition will render available a

large volume of capital for more useful purposes. Again, the improvement in credit, when borrowers have ceased to yield to the temptation of becoming drunk, will be an important commercial factor. Next, the cesspools of the city—the brothel and the saloon—will become less potent factors in the community, for vice thrives upon intoxication. Another thought comes to allay our annoyance at the thought of a perpetual aridity: we remember the bright and capable men, the clever and charming friends, that succumbed to intemperance and went to a premature grave. We would forego a good deal of wine to have some of them back. But, after all, the strongest argument for accepting prohibition in a docile temper is the fact that a republic is governed by its representatives and when a majority of those representatives enact a law it is for us to obey it, pending, if we insist, the legalized procedure for repeal. To talk about resisting the law or to suggest the failure of juries to convict for infractions of it is undemocratic. Whether a man may or may not take a drink is immaterial as compared with the question whether he will behave as a citizen or as an outlaw. We feel confident that the people of the United States will accept prohibition in good faith, and we anticipate that once established the new order of life will persist indefinitely.

Carranza's Mexico

Signs are multiplying that even the long-suffering administration at Washington is becoming vexed with the Mexican government of Señor Venustiano Carranza. The policy of watchful waiting was well meant and might have succeeded if this leader of the so-called Constitutional party had made the most of the chance given to him, by the American government, to establish law and order in Mexico. It is announced that "urgent representations" have been made to the Mexican government for the punishment of those responsible for the murder of John W. Correll, an American citizen, the maltreatment of his wife and the attempted murder of their son, at their ranch near Colonia, 27 miles north of Tampico. The mention of the locality is significant because a few days after Correll had been murdered the paymaster of the Gulf Refining Company, an American enterprise, was 'held up' and robbed of \$15,000 in gold which he was taking from Tampico to the oilfield; and this was done after the local authorities had been notified of the route he would take and of the need for protection in going about his regular business. This was in so-called Carranza territory, that is, a region dominated by Federal troops, who, however, not only failed to give the proper protection to legitimate industry but, some of them, in uniform, actually raided a camp of the National Oil Company, at Panuco, and robbed the employees of their money and valuables. On top of these items of lawlessness, it is reported that the Mexican government has prevented American oil-drillers from working on land that had been purchased from its Mexican owners in the ordinary way, that is, it was not a Government

concession, but private property. These incidents are in no way remarkable; more than 300 Americans have been killed in Mexico during the revolutionary period of the last eight years and American properties innumerable have been looted or destroyed; the recent happenings have fresh significance only because they mark the near approach of a limit to the patience with which the American people have waited in the friendly hope that the Mexican would set his house in order and become a respectable neighbor. It is, of course, not a little absurd that a government with a mission to assist in the establishment of civilized methods in Armenia and Dalmatia should shirk obligations at its back door. Apparently—and the wish may be father to the thought—the Administration at Washington is ready to turn from the consideration of mandatorics far across the seas to the acceptance of a more logical and more pressing mandatory across the shallow waters of the Rio Grande. It is about time. Every intelligent citizen in this country must be tired of the *opéra bouffe* varied by blackmail, rapine, and massacre that has flourished for nine years in Mexico, into which American men and American capital were cordially invited to come by Porfirio Diaz during the more than thirty years of his presidency. These alarms and excursions at Columbus, Cananea, and Juarez are ceasing to be even picturesque. We understand why a filthy brigand like Villa and a crafty desperado like Zapata are enabled to continue their depredations year after year in mockery alike of the *de facto* and *de jure* government of the pompous ass who is ready to ally himself with any enemy of the United States that makes him an offer of money. Only recently two American mining engineers, Harry White and W. L. Tovote, were killed, it is said, by the Yaqui Indians, just as if the Yaquis were not Mexicans, who themselves are Indians. This talk of Latin America and Spanish America is mere camouflage, the fact being that our southern neighbors are Indians with a slight admixture of alien, chiefly Spanish, stock; and even that small infusion of European blood has become less influential during the disorderly period since Diaz resigned, because the larger part of the Spanish population has emigrated to a safer domicile, shirking their responsibilities and leaving their hapless country to the more ignorant *mestizos* and the full-blooded *indios*. Mexico today is only 10% white, and, what is even more significant, it is 85% illiterate, in this respect being comparable with Russia, which, like Mexico, therefore is entirely unprepared for any form of representative government. Since Humboldt's visit, in 1810, the mixed population of Mexico has more than doubled. Both Diaz and Huerta belonged to this group. Even the undiluted Indian has risen to positions of power. We are not dealing with a Spanish colony but with a people among whom liberalism works as an explosive and to whom the contact with our material civilization has been the cause of persistent political ferment and systematic corruption, such as flourished, say, in the time of Louis XIV or Charles II. Mexico is in the kindergarten of social evolution. Consider Carranza's

attempts to administer the country with a combination of crazy idealism and sordid craftiness. He is not a soldier, he rose to power by means of the military ability—at least for the sort of fighting that obtains in Mexico—of Villa, Obregon, and Angeles, all of whom are now opposing him. He holds his remaining generals only by permitting them to graft at their pleasure. The Federal appropriations passed by the Mexican Congress for 1918 included 120,755,631 pesos for the Department of War and Marine; this was two-thirds of the entire budget and nearly all of it went to the army, which nevertheless is unable either to drive Villa's band of outlaws into the mountains or to make a decent showing when he puts up a fight periodically. The reason why the Federal troops are so ineffective is because the money voted for their maintenance is squandered by the generals in riotous living in the City of Mexico and because the officers in the field actually sell arms and ammunition to such bandits as Villa and Zapata. Although the latter is dead, others of his kind are numerous. The military authorities have to be bribed in order to get anything, from the use of a railroad car to the permission to employ labor. The names of 37 defaulting army paymasters have been published in the newspapers of Mexico City. Carranza's revenue largely exceeds that collected by Diaz, and he gets it not by just taxation but by confiscation, which has paralyzed industry. Much of the rolling stock of the railways has been destroyed during the guerilla warfare and what has survived is so out of repair that only two lines, those from Laredo and from Vera Cruz to the capital, are able to maintain a regular service. The population in the bigger cities, such as the capital, Vera Cruz, Guadalajara, and San Luis Potosi, has been increased abnormally by thousands of utterly destitute people, brought thither largely by the fear of living in the country, where they are the victims of recurrent brigandage. Agriculture is neglected because it is unsafe to remain on the farm, the produce of which likewise is at the mercy of bands of marauders. The officers of the American Red Cross were requested by Carranza to leave Mexico in the latter part of 1915 after having begun a campaign of benefaction in behalf of the suffering poor. In Mexico City alone they fed 26,000 families daily, and they reported the conditions there, at Monterrey, Monclova, and Saltillo as appalling. Yet Carranza's adherents were permitted to ship 37,000 tons of foodstuffs through the port of Vera Cruz and to enrich themselves thereby. Potatoes have been sold at El Paso by the carload from Guerrero while the people living in that district were dying of starvation. In short, an incapable politician, supported by a motley group of military chiefs whose support is based on the privilege of unlimited graft, is at the head of an administration that is unable to perform the functions of government, that is, to protect its citizens, stabilize industry, and uphold the law. Mexico may have a government *de facto*, it has none *de jure*. It neither possesses the power nor shows the inclination to discharge its obligations either to its own people or to those of a neighboring country.

Considerations on the Treatment of Flotation Concentrate

By OLIVER E. JAGER

It may be stated as an axiom that flotation has come to stay, at least till we find something better. That there will be improvements in the process is also true, on account of its possibilities and of the large amount of intelligent experimentation that is being carried on. The high recovery obtainable with this process is its chief recommendation, though it must not be forgotten that a higher operating cost is attached to it, and that the total extra cost will absorb a quite appreciable percentage of the increased value recovered. It is of interest, therefore, to review briefly the new conditions that will arise when flotation is adopted as part of the ore-treatment process. Or, in other words, what changes, if any, must be made in the smelting process and equipment, and what differences are to be expected in the results, when a considerable proportion of the material to be treated consists of flotation concentrate.

In order to make any differences more apparent, we will assume the case of a smelting plant having a concentrator, the whole being in operation, and that the latter is about to install flotation. Changes necessitated in the milling machinery will not be discussed here, being outside the scope of this article. If the ore is of such character (unfortunately rare) that it does not require the fine grinding of a large proportion of the mill-feed, the amount of flotation concentrate produced will be small in comparison to the whole. Under these conditions, the addition of the small amount of flotation concentrate to the roaster charge will hardly be noticed. But if the ore has its valuable constituents finely disseminated, or if, for any reason whatever, a large proportion of it is finely ground, so that there is a heavy production of flotation concentrate, the effects due to the introduction of flotation will begin to manifest themselves in various departments of the plant.

The first difficulty is in the thickening of the flotation concentrate preparatory to filtering it. The point is, that a certain amount of residual froth will usually remain on the surface of the liquid in the thickening-tanks, and that this froth is not easily broken. While this annoyance is more marked in some cases than in others, it is nearly always encountered. Some plants succeed in breaking this residual froth by placing a spray-pipe around the inside edge of the tank top, so that the radial jets of water cut up the froth.

Assuming the flotation concentrate to have passed through the filters and been deposited in a bin, it then becomes necessary to get it out of the bin in order to feed it to the roasters. The belt-conveyors that worked

successfully on the coarser material from water concentration will not handle the wet and gummy flotation concentrate, so that some other device, such as an apron-feeder, will have to be used. Having got the material to the roaster, the next thing to consider is the roaster itself. With the introduction of a considerable amount of very fine material, conditions will be changed, calling for certain adjustments on the furnace, such as speed, depth of charge, temperature regulation, etc., and every precaution must be taken against producing dust. Flotation concentrate is usually fed along with coarser concentrate from the tables and fine jigs, and in some cases the feed is very irregular as to size. It would be interesting to know whether a mixture showing a wide variation in size has any adverse effect on the tonnage or operation of the roaster. If there is a decided tendency toward agglomeration, the introduction of some inert material may be necessary. This is not a difficult matter, as fluxes are generally put into the roaster to ensure a proper mixing with the other ingredients of the charge. The liability of forming nasty hearth-accretions must not be overlooked. More dust will be produced when roasting flotation concentrate, which brings up the question of flues, and flue-dust handling and treatment. Once the new conditions are fairly established, investigation of dust losses may have to be undertaken in order to determine whether the existing flues are adequate to settle the fine dust now being produced. It will probably be found that some improved method of dust-catching will have to be installed, which naturally brings up the consideration of the Cottrell process, with the subsequent handling and treatment of the fine light dust resulting therefrom.

Having roasted the concentrate, the next step is to get it to the reverberatory furnace. On account of the fine nature of this product, it produces dust easily, so that arrangements must be made to prevent inconvenience and loss through dusting. The drop from the roaster-hopper to the car must be as low as possible, and should take place preferably through a pipe or covered chute. The car will probably need alteration, as it should be covered at the top as much as possible. On reaching the reverberatory furnace, a further quantity of dust will be produced when the hot material is dumped into the charge-hoppers. The covering of the reverberatory feed-floor would prevent a lot of dust getting away, but it would also make the place uninhabitable while dumping was in progress. About the only way to obviate this difficulty is to place light steel housings over the tracks on the reverberatory feed-floor. A kind of tunnel is thus

formed, large enough to allow the entrance of the roaster-cars, which are got at, for dumping, through doors on the sides of the tunnel. Assuming that the reverberatory furnace is charged along the sides, there will be less protection for the walls of the furnace with this very fine material, as it will not stand up in a heap along the side-walls like a coarser charge. There is also a greater tendency for the fine material to flux the brick of which the furnace is built. All this may necessitate a thickening of the side-walls and roof of the furnace. With a charge containing much roasted flotation concentrate, there is a chance for the fine dust to enter the slag and raise its metal content. See a previous article.*

When using water concentration only, the plant may have been equipped with some slime-settling arrangement, such as ponds, dams, etc. A change in the scheme of treatment will probably be made at this point, the slime being thickened in tanks and re-treated by flotation. This does not necessarily infer a lower cost of treatment, although it would obviate excavation and re-handling at the dams.

There has been considered here the case of a smelter having reverberatory furnaces, since the roast-plus-reverberatory seems to be the logical method of treatment for flotation concentrate. Another set of conditions arises in the case of a plant having blast-furnaces only. One plant of this class in the North-West is dumping flotation concentrate directly into the furnace in the form of thick mud. No figures are available on the ensuing dust-losses, but the method is open to criticism. However, it is worth mentioning as an expedient. In sintering flotation concentrate various difficulties arise with the grates, which means decreased draft and lower tonnage, even when some coarser material is mixed into the charge. Briquettes, even under favorable conditions, produce considerable dust in the blast-furnace, and it is not to be expected that the addition of flotation concentrate to the briquette-mill charge will lessen this evil. Nodulizing possesses some advantages, but there is little information available on this process, probably on account of its not being widely used. Pot-roasting requires a preliminary roast, in which the roaster troubles mentioned above would be involved, as would be the case should a pre-roast be given with sintering. Modifications of process will be necessary in any case, and may result in the final adoption of some combination method of special preparation of the charge going to the furnaces, all of which means more trouble and extra cost.

A custom smelter purchasing flotation concentrate will, of course, experience the above difficulties (with the exception of those connected with thickening) as well as the annoyance incident to unloading and handling a

In an article of this nature, one has, of course, to deal in generalities. While it is not suggested that all these effects will be felt at every plant using flotation or handling flotation concentrate, they are given to show the lines along which consideration must be made when there is a noticeable increase in the amount of very fine material to be smelted.

Copper Leaching at Kennecott

The following data from the operating records of the Kennecott Copper Corporation's ammonia-leaching plant at Kennecott, Alaska, represent an average taken over the period January to April, 1919, both inclusive, and cover salient points in current metallurgical practice:

| | | |
|--|-------|---------------------------|
| Assay of leaching-plant heading—carbonate copper. | 1.04 | % |
| Assay of leaching-plant tailing—carbonate copper. | 0.32 | % |
| Extraction | 79.3 | |
| Average moisture content of heading | 4.75 | |
| Average assay first leaching solution | 3.75 | Cu, 7.70% NH ₃ |
| Average assay second leaching solution | 1.85 | Cu, 8.60% NH ₃ |
| Average assay of rich solution to stills | 5.54 | Cu, 8.37% NH ₃ |
| Average assay of ammonia concentrate made by stills | 17.1 | NH ₃ |
| Average assay of precipitate produced | 75.8 | Cu |
| Average length of first leach (still) | 13 | hours |
| Average length of second leach (circulating) | 42 | hours |
| Average Consumption of Steam | | |
| For tailing wash: | | Lb. |
| Per ton of material leached | 108 | |
| Per pound of copper produced | 6.4 | |
| For distillation: | | |
| Per ton of material leached | 226 | |
| Per pound of copper produced | 14 | |
| Total steam: | | |
| Per ton of material leached | 334 | |
| Per pound of copper produced | 2.04 | |
| Consumption or loss of ammonia: | | |
| Per ton of material leached (100% NH ₃) | 0.55 | |
| Per pound of copper produced (100% NH ₃) | 0.033 | |

Notes from the St. John Del Rey Report

During the year ended February 28, 1919, there was mined and treated at the property in Brazil 167,854 tons, yielding 99,874 oz. of gold. The profit was \$570,000. Dividends amounted to \$326,000. Some of the troubles were floods and influenza. The mortality from the plague was 2% of the cases; 75% of the population was afflicted. There were five fatalities at the property. During the past five years, 75.2% of the accidents were due to 'blistering' rock. There were 938 people employed, 28 being Europeans and 905 natives. Ore-reserves are estimated at 1,209,104 tons. The ventilating system was kept in good order, the Sirocco fans being stopped only 1 hour 37 minutes during the year. The temperature of the rock at a depth of 6100 ft. was 108° and the air 99°. This was during the four hot months. The initial rock temperature at the time of opening new levels was 98° at 4100 ft. and 116° at 6100 ft. The treatment works extracted 91.8% of the gold. Cam-shafts broke frequently, due to the poor quality of steel. Mine rock was used in the tube-mills, after being partly rounded in a rough mill. Assay crucibles and liners for graphite crucibles are made at the works. The manganese deposits were sampled and average from 47.27 to 51.36% Mn and 7.88 to 11.29% Fe. The hydro-electric plants supplied 134 motors with 3559 hp. at 2.7c. per day.

wet and gummy material.‡ The introduction of any drying process means added expense and loss of time.

The Chloride-Volatilization Process

By BLAMEY STEVENS

The idea of extracting metals from ore by a chloridizing roast and the simultaneous volatilization of the chlorides is due to Stuart Croasdale.¹ His observations of the character of deposits in smelter-flues and stacks led him to consider the practicability of volatilizing the major instead of the minor part of the valuable metallic contents by this action.

It has been known that the haloid compounds of most metals volatilize at much lower temperatures than the metals themselves, but many of the chlorides were also known to be unstable at high temperatures. This and other complexities may have previously discouraged other metallurgists; in fact, difficulties still stand in the way, but, remembering that cyanidation and flotation processes were developed without being well understood in theory, the pioneers of the present process are encouraged in their more or less blind endeavors.

The principal difficulty originally mentioned by Mr. Croasdale was the unsatisfactory precipitation of the chlorides. E. L. Blossom at that time (May 2, 1903) reported to the Montana Ore Purchasing Co. of Butte that "as applied to Rarus ore, the process is too far from a commercial possibility to be worth mentioning."

The first patent² was granted to Edwin C. Pohlé and Stuart Croasdale in 1903, but by this time Mr. Croasdale already had a plant erected and operating near Denver, Colorado, the Metals Volatilization Co. having supplied the capital. A. W. Hudson, now of Tyrone, New Mexico, was employed in making the practical tests.

Ben Howe³ professes to have discovered the process some nine years later, and applied it, in Western Australia, to the treatment of antimonial gold ores. As with Mr. Croasdale, he reports his greatest difficulty to have been in dealing with the fumes.

With the invention of electrical precipitation⁴ and its application, by F. G. Cottrell, to practical purposes, a new hope was opened for the chloride-volatilization process and this was plainly recognized in the discussion initiated by Mr. Howe's articles.

⁴'Mining and Scientific Press', March 29, 1913. Trans. A. I. M. E., Sept. 1913, and bibliography there given. Particulars of the process are also given by the owners, the Research Corporation, of New York. The Western rights are handled by the Western Precipitation Co., at Los Angeles, California.

In 1906, O. H. Fairchild⁵ described a plant erected at Mayer, in Yavapai county, Arizona, having four furnaces of the cement-kiln type 36 ft. long and 5 ft. 6 in. to 7 ft. 6 in. diameter of shell. There is no statement of the results obtained, but the venture is known not to have been a success.

About 1916 the Weldon Mining Co. of Canada took an option on some mining property in Nevada. Looking for a method of treatment, Mr. Adams, the president, persuaded O. C. Ralston, then of the U. S. Bureau of Mines, to undertake an investigation by the chloride-volatilization process⁶ and experiments have ever since been carried on at their Salt Lake City station, latterly under the superintendence of F. G. Moses; Professor Bradford of the University of Utah, where the station is placed, has also made some study of the subject.

G. H. Clevenger of the Colorado Springs station of the Bureau of Mines has been especially interested in the recovery of potash from ores by a similar process. The recovering of the precious metals might, in fact, be combined with the recovery of potash.

The process as now applied experimentally consists of mixing salt or brine with the ore and roasting it in a current of air at a temperature as high as it will stand without sintering too much. The fumes are collected by the Cottrell electro-static process and may be treated in several different ways according to their character, the usual method being to mix them with the required amount of lime and a small amount of reducing agent and melt, recovering the valuable metals as bullion. The lime-chloride slag may be used in the roasting of more ore, so as to economize salt.

Owing to the liability of the ore to sinter, it is hardly possible to use any form of mechanical-rabbling furnace and from the first the cement-kiln type has been used. Since the interest of Edison was directed to the cement-making art, these furnaces have been made of great length, so as to economize heat by minimizing the difference in temperature between the gases leaving the furnace and the pulverized material entering it at the same place.

The chloride-volatilization process, if placed upon a practical basis, might be useful in the following cases:

1. Desert ores, too much oxidized for flotation or other means of concentration.
2. Ores high in zinc and not suitable for smelting.
3. Ores that cannot be smelted because of the want of flux for the formation of a fusible slag or of a collector

⁵'Mining and Scientific Press', Sept. 1, 1906.

⁶O. C. Ralston, Trans. A. I. M. E., Vol. LVII, p. 648. (1917).

such as lead or copper. Deposits distant from a railroad are especially liable to suffer from such deficiencies.

My first interest in the process was to obtain a satisfactory method of treatment of some Mexican silver ores that were not amenable to cyanidation. Experiments in the muffle-furnace showed that a good proportion of the silver could be driven off as chloride in a reasonable time, with the temperature below the sintering point. It then became necessary to investigate the practice. Accordingly I visited the Salt Lake City station of the Bureau of Mines, the plant erected by J. H. Hirt for an El Paso company, headed by a Mr. Biesel, and the plant of the Chief Consolidated Mining Co., at Eureka, Utah, in charge of G. H. Wigton.⁷

These were the only plants of working size and in each case the extraction obtainable by passing a moderate tonnage through the furnace was too low to be economical. In Mexico, P. A. Babb has conducted extensive experiments for the Blaisdell Co. at Pachuca, and G. B. Hinton has conducted experiments at his laboratory in Mexico City.

The theory of the chloridizing roast had been previously studied by Hofman⁸, Greenawalt, and others. They were only concerned, however, with the old Washoe and lexiviation processes and the volatilization of the chlorides was simply touched on to the extent that they wished to avoid it and therefore keep the temperatures of the roasting hearths sufficiently low.

Croasdale considered that the salt reacted with the sulphides of the metals and oxygen to form sodium sulphate and chlorides of the metals, but laboratory experience shows that sulphides in quantities are detrimental and that the reaction of the salt on silica is even better suited to the formation of the metallic chloride.

Little is known of the gases formed, but it is evident that they must be complex, involving the formation of oxy-chlorides and other compounds of which little is known. An oxidizing atmosphere is said to be absolutely necessary, and apparently the good results usually obtainable in the laboratory are due to the facility of access of air to the thin layer of ore in the muffle.

The chemists of the Bureau of Mines consider that the vapor-pressure of the chloride is very small, and consequently that the solution of the chlorides in air must be very dilute. It is well known, however, that vapor-pressure are increased by an important ratio with a moderate addition of temperature. But it may be that this additional temperature brings about other chemical or physical action affecting less volatile compounds, and that these prevent the free formation or volatilization of the chlorides. If such be the case a certain amount of control might be obtained by the introduction of other reagents than salt, or in addition to the salt. On the other hand, if the idea of the Bureau of Mines is not correct and the principal practical trouble is in the formation, not the volatilization, of the chlorides, the remedy would evidently be to pass the ore through a low-temper-

ature roasting-furnace with plenty of oxidizing surface and form solid chlorides before attempting volatilization in the high-temperature kiln. Whether or not this should be done, could be easily determined without the installation of furnaces equipped with mechanical rabbles.

I believe that the process deserves investigation by expert chemists, but it may well be that, like many other metallurgical problems, it will be first solved by men of less scientific education and more of that invaluable combination of originality and persistence by which so much is accomplished in every branch of industry.

Accidents in Mining

*Mining is one of the extra-hazardous industries, employing more than 1,000,000 men in the United States of whom three or more out of every 1000 men employed are killed each year by reason of some accident. While complete data relating to non-fatal injuries are not available, yet reports to the Bureau of Mines for all metal mines in the United States, show that at least 250 men per 1000 per year are injured sufficiently to cause a loss of time. Approximately the same rate will apply to other branches of the mining industry.

In all industries there are a certain number of accidents that are inherent, for which it is impossible to place the blame on anyone. These equal about 50% in the mining industry. The responsibility for the remainder may be placed about equally on the operator and the employee.

The campaign of education for employees in the various industries has also been extended to the mining industry to the extent that many of the larger operators are making special efforts to educate their workmen in various ways. So far as accidents are concerned probably the principal thing that can be done along educational lines is to see that the employees are thoroughly instructed in the English language, and as to the dangers which they encounter when they enter the mine, and to furnish them, through their superintendents and shift-bosses, instructions as to how to avoid accidents and to take care of themselves. Much of this educational work may be done through safety committees, consisting in part of members from the various occupations in and about the mines, giving the miner an opportunity to make suggestions that he considers will prevent accidents in his particular working place. Many of the companies have these committees actively at work, and they are meeting with gratifying results.

ALL WASTE BROKEN in development in the United Eastern gold mine at Oatman, Arizona, is used for stope-filling, and additional waste required is broken in a waste-stope started for that purpose. This waste-stope is supplying filling at lower cost than that extracted from raises in the walls.

A Metallurgical Journey to Shasta, California—III

By HERBERT LANG

SULPHIDE ORES. The Kennett chlorination plant has sunk into decay, and a copper smelter has taken its place. The mule-team has made way for the steam-locomotive, the wagon for the train of cars. Instead of the minute working of an occasional 'jag' of ore or concentrate, a daily supply of more than a thousand tons comes to the big smelter, whose activities affect the life of remote mining communities. And with these changes has come also such a reduction in the cost of treatment that those ores which had been worked in a small way and frequently at a loss when \$20 per ton was paid therefor, go through the big furnaces for \$3 per ton, and even less. It will be worth while to examine into the developments which made such revolutionary changes possible.

Along the hills that border the Sacramento river on its west side, in the region between Redding and the mouth of the Pit river, is a mineralized belt in which, at intervals, lie immense bodies of base sulphides. The rocks that hold them, older than those in which the quartz veins are found, are themselves peculiar, but their characteristics in only one respect have a metallurgical significance. They are acid lavas, containing 70% of silica, and it is not a little strange that ores situated wholly within them and from which they are unquestionably derived, should prove so devoid of that constituent. This fact has made it necessary to go outside for a supply of acid flux and has stimulated the gold-quartz mines of the surrounding region into unwonted activity. The furnishing of flux for the smelters has become a business of vast importance, while the stamp-mills have relapsed into idleness.

This base-metal region does not end at the mouth of the Pit, for isolated lenses of ore are found east of the Sacramento, clustering about Bully Hill and Ingot, many miles from what may be called the heart of the district. Discovery has succeeded discovery until hundreds of orebodies have been revealed, among which are some now ranked among California's great mines; orebodies reaching a width of 300 ft., and others whose known length surpasses 1000 ft., have been worked, enabling the extraction of six million tons of ore containing 300,000 tons of copper, and worth, with the precious metals, more than \$100,000,000.

These results have been obtained mainly from ores that at an earlier epoch would have been classed as low-grade, and now rank among the poorest that are treated by smelting. While at first a good deal of the ore contained much copper, rising to 7% in the case of the Iron Mountain deposit, the average material now handled does not assay above 3%. Concentration has come to the aid of smelting, but it cannot displace it, as smelting displaced amalgamation, chlorination, and cyanidation.

What influence these processes have had upon each other will appear in the course of this writing.

I have spoken of these extraordinary ore deposits as valuable for their base metals. Let us examine into their composition, in view of the course of treatment now considered advisable, and endeavor to anticipate what, in the course of natural evolution, is likely to be done in the future. In the first place, the ores remaining are almost exclusively sulphides, the metals contained in them being iron, copper, and zinc, with smaller proportions of lead, arsenic, silver, and gold. The minerals in evidence are pyrite, pyrrhotite, chalcopyrite, bornite, chalcocite, and sphalerite, with others of less importance. The upper portion of the orebodies, at the surface and to a little depth, consist largely of limonite in an impure condition. None of the minerals is pure; all contain impurities, even those which are crystallized and apparently unmixed. Thus, the pyrite of the Hornet mine, when assayed, shows a small content of silver and gold, very small, to be sure, but invariable. The average precious-metal content of the pyritic masses is not far from \$2 per ton, and this value does not seem to increase when the pyrite is intermixed with other primary sulphides. It is a fact, however, that certain superficially enriched ores show, as would be expected, a concentration of silver and especially of gold, and several instances are recorded of copper showing parallel enrichment. Surficial enrichment extends also to the gossan, in which there is not only no sulphur, but no copper or zinc. This is to be expected, and brings us to consider what the orebodies really are, and what variations have followed naturally from their decomposition. Speaking generally, there are three classes of ore, discriminated as follows: First, beginning at the bottom, there are the unaltered sulphides of iron, zinc, and copper, together with more or less gangue, of which I will speak hereafter. The sulphides are closely intermixed, as a rule, so closely that sorting is impracticable, the different minerals not being detectable by the eye. This statement, however, admits of some qualification because there are exceptions enough where a good selection is regularly made, as, for example, in the Mammoth mine, where an ore averaging 20% zinc (and therefore 30% sphalerite) is mined and sorted to give a 40% zinc product, which is shipped. The remainder, being average ore, was smelted for the copper, gold, and silver, at the Kennett works. Again, the Rising Star mine at Bully Hill produces ore of an average grade of 3% copper, but by careful sorting it can be divided into two classes, the first of which averages 6% copper, with perhaps \$1.50 in precious metals. This also is sent to Kennett for smelting, the poorer material being reserved for concentration. Of the first class over 20,000 tons was

shipped last year. The sorting did not by any means get rid of all the zinc, but simply raised the grade in copper. Sorting has been carried on at all the large copper mines, to improve the shipping product, and likewise considerable masses of sulphides, comparatively rich in one or the other metal, have been discovered in the course of mining. For example, there existed in 1895 in the Iron Mountain mine a mass of chalcopyrite, of the kind typical of that mine, many thousand tons in weight, which averaged not less than 15% copper. Within it a chamber had been cut, the size of a bedroom, the walls of which showed absolutely nothing but solid ore. The Afterthought system of veins also has produced ore of this character in considerable quantity, although the unaltered sulphides carry only 3% copper, with 6 oz. silver and a little gold. A conspicuous example of surficial enrichment was seen in the Bully Hill mine, from which Capt. De Lamar drew great quantities of ore averaging 10% copper, and which in certain places carried \$20 in gold. From this ore he made handsome profits, having his own smelter and converter plant. Before his time the mine produced secondarily enriched ores of the oxidized class, which were silver-milled with some success, but which changed at a moderate depth into complex sulphides of lower tenor and more refractory character, bringing operations to a standstill. Still earlier in the 'seventies the placer miners found rich gravel on the flanks of the hill and in ravines leading therefrom, from which they took much wealth, all derived from the cropings of the ore-lenses close-by. Altogether it is doubtful if there exists a better illustration of the various phenomena of surficial enrichment than in the mines of Bully Hill. The present workings, now 500 ft. deep, have reached the zone of unaltered sulphides, of which great quantities are exposed.

Inspection of the mines covered by an 'iron hat' shows their triplex character, since they invariably show the gossan or oxidized portion, the underlying enriched sulphides, and the unaltered sulphides beneath. The gossan is sometimes of present value and of greater prospective value, since it contains at least a little of the precious metals, and is basic in character, holding more of the oxides than of silica, and hence affording a valuable flux for smelting purposes. Except for its impurities, by which the percentage of iron is too much diminished, the gossan might be looked upon as an iron ore, likely at some future time to be worked as such. For the present there is little likelihood of this use being made of it. Enormous quantities exist; in the Iron Mountain mine, for example, one finds it exposed on a great scale, a long adit penetrating such ore for several hundred feet, assaying about \$2 per ton in gold and silver, and almost devoid of sulphur.

The various sulphides are far more regular in their distribution. In some mines, the Iron Mountain, for example, pyritic iron (by which both pyrite and pyrrhotite are meant) constitutes by far the larger part of the mass. In this mine, speaking of its great sulphide lens, now exhausted, pyrite must have made up fully three-

fourths the 1,750,000 tons of ore upon which first smelting operations were based. We may say now of this ore-body that it averaged 7.4% copper, 80c. in gold, and 2 oz. silver per ton. Certain parts were extremely rich in chalcopyrite, while other parts were correspondingly poor. Large masses, aggregating hundreds of thousands of tons, carried only 1 or 2% of copper, and were only fit for making acid. The same thing is measurably true of other deposits in this district. In the eastern part there seems to be less pyrite, and consequently less sulphur. Sphalerite also is distributed irregularly. There was scarcely any in the Iron Mountain lens, while in the northern and eastern parts of the base-metal range it is extremely abundant. The charge of the Mammoth blast-furnaces averages almost 4% zinc, which corresponds to 6% sphalerite. It has been so abundant in the Bully Hill ores as to prove a deterrent to smelting, and has defeated the efforts of the Afterthought smelter to run successfully, whereby that great property has been driven to apply other methods, as we shall see.

MASSSES OF PYRITE. At several points in the base-metal range there exist bodies of comparatively pure pyrite, which being poor in copper and the precious metals, have not been utilized as yet by the smelters. Their exceptional freedom from arsenic or other injurious constituents, and their high sulphur content, makes them peculiarly adapted to the manufacture of sulphuric acid; relatively small quantities have been shipped to the neighborhood of San Francisco, and burned for that purpose. The Hornet mine, near Iron Mountain, the property of the Mountain Copper Co., is such a pyritic orebody, and within its bounds a compact mass weighing no less than 6,000,000 tons has been explored. In other parts of the range similar, but smaller, bodies of this nature exist, in particular in the Rising Star mine, at Bully Hill. A little copper is invariably found in these pyritic ores, but only a little. The Hornet ore is supposed to average about 1.5% copper, with a little over a dollar in precious metals. It carries also a trifle of zinc, and a few percentages of silica, etc. This ore, on being burned at the acid-works, leaves a residue, called 'cinder', which is of some interest. A pile containing 60,000 tons lies at the works of the Mountain Copper Co., near Martinez; it has been leached with water to recover that part of the copper which exists in the soluble form, that is, as sulphate, formed during roasting. An average analysis of this leached material shows:

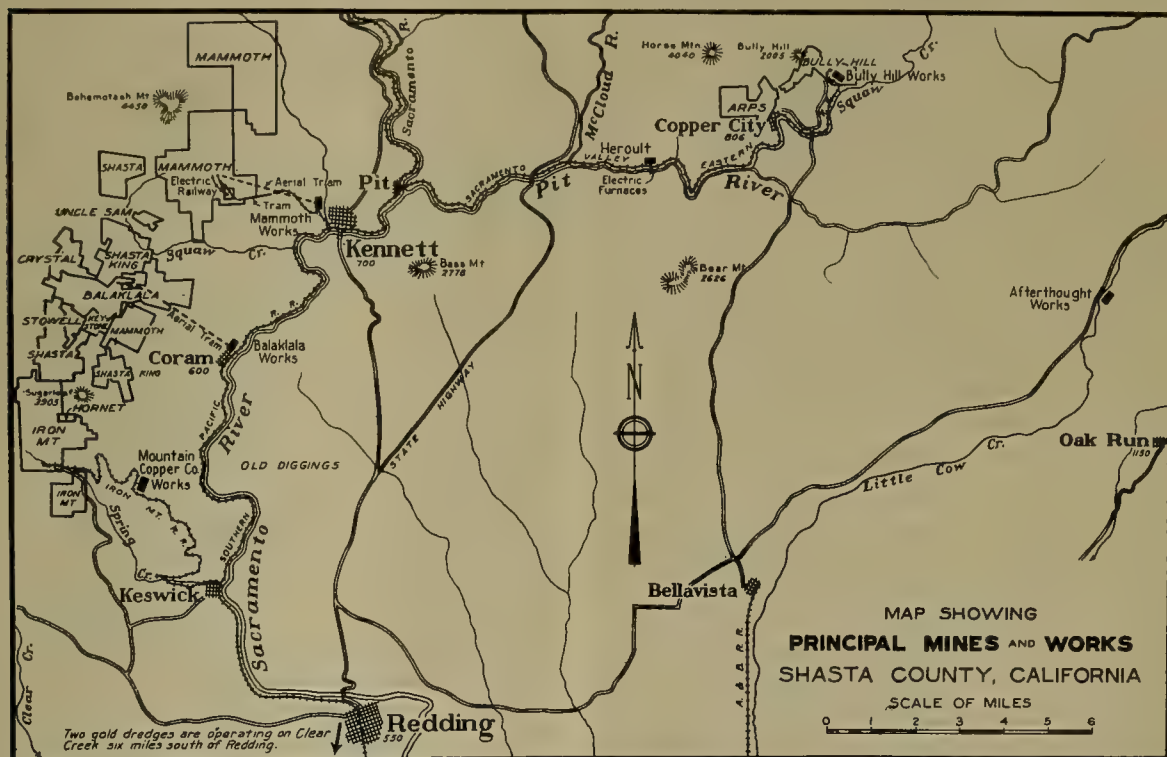

| | % |
|---------------|-------|
| Copper | 0.45 |
| Sulphur | 1.86 |
| Silica | 3.85 |
| Iron | 63.37 |
| Zinc | 1.59 |

It contains also, 0.02 oz. gold and 0.9 oz. silver per ton.

PYRITIC CINDER. The proper disposal of this accumulation presents some pretty metallurgical problems. In other countries there would be no difficulty in disposing of it profitably, but conditions in California are such as to make it almost a waste product. Pyritic cinder else-

where is smelted direct into pig-iron, as it constitutes a rich iron ore, in which respect the Hornet cinder is as good as any. The fine-grained condition and the high content of sulphur, however, render it of less value than ordinary run-of-mine ore, and it is generally used in small proportion along with coarse ore, in making a comparatively cheap iron, suitable mainly for purposes where strength is not particularly demanded. But even this use is denied it in this State, since we have no furnaces for smelting it. It may also be used as flux in smelting more silicious copper and lead ores, and some Mountain Copper cinder has been shipped for that purpose as far as Salt Lake City, although one cannot imagine much profit accruing to the purchasers. It is

acid, sulphurous acid, chlorine, and hydrochloric acid, and adding the acid waters to the calcined material, when some insoluble copper compounds, such as cupric chloride and oxide, are also taken up, as well as the gold and silver. The two precious metals are precipitated by means of zinc iodide and free iodine, and then separated by filtration. The copper is precipitated by iron scrap, or preferably by sponge-iron, and is collected as cement copper. This process has been in use for more than 50 years, and has added greatly to the world's store of metals. It might be initiated profitably here if a market could be found for the final residue of iron, which constitutes an important source of revenue in England, where the process has its largest scope.

useless to the smelters in Shasta county, since they are over-stocked with basic material, and need silica rather than iron. Similar material is treated in large quantities in Europe by processes designed first to extract the gold, silver, and copper, after which the oxide of iron left (and in that condition called 'blue billy') is run down in the iron-furnace. The experience of years has led the metallurgists of Europe to prefer the so-called Longmaid-Henderson process for extracting the gold, silver, and copper, since by it, with some additions, all three metals may be won in satisfactory proportion. It consists, briefly, in calcining the cinder with from 10 to 20% of common salt, for several hours (5 to 10) whereby the silver and copper are converted, the first wholly, the latter partly, into chlorides, which are soluble in brine, and still more so in a solution obtained by catching the evolved gases in a 'tower', they containing sulphuric

Other processes have been suggested for the treatment of pyritic cinder, among them is lixiviation with sulphuric acid. This, however, does not dissolve the silver or the gold, which therefore are lost. Neither will the dilute acid attack the sulphide of copper, a little of which always remains after calcination, and this too is lost. It should be borne in mind that the result of calcining copper-bearing sulphides in general is to convert a part of the copper into the sulphate, another part into oxide through the decomposition of some of the sulphate, while, as just remarked, still another portion retains its original form of sulphide. An analysis shows that of 100 parts of copper in a certain ore that had been calcined for making vitriol, 54 parts existed as sulphate (and therefore soluble in water), 38 parts as oxide (soluble in weak sulphuric acid), and 8 parts as sulphide (soluble only in nitric acid). By skilful manipulation

the parts soluble in water can be much increased; but such manipulation is not practicable in kiln-roasting, nor generally when the ores are being calcined for their sulphur content.

MAKING ACID. The problem* of the proper treatment of pyritic cinder must give way to the more important one of the treatment of the raw sulphide as it comes from the mine. Assuming, which is true, that the heavy pyrite, such as we are now considering, is valuable mainly from its content of sulphur, and that it does not carry enough of copper, gold, and silver to pay for their extraction solely, the question is what process should be employed to render them as well as the sulphur simultaneously available for the market. The answer is not far to seek. At Ducktown, in Tennessee, a large copper smelter has attached to it the largest sulphuric acid plant in the world, capable of making 1000 tons of 60° acid in a day. The smelting method is the pyritic, the same process that has given Shasta county its eminence in copper production. The ore, like those of Shasta, carries about 3% copper, but without gold or silver. It averages 30% in sulphur, which, in the course of smelting, is discharged from the furnaces in the form of sulphur di-oxide, as elsewhere, but instead of being allowed to pass into the atmosphere the fume is conducted into lead chambers and converted into acid. The process, of course, is practicable wherever sulphide ores exist, and it is applied successfully, for example, both at Trail, Anaconda, and Douglas.* The method differs from that commonly pursued only in the manner of getting the di-oxide; for the ordinary way is to roast the pyrite in a kiln or mechanical furnace, without smelting the ore. In this case a residue of iron oxide is left. At Ducktown the residue is smelted into slag and matte, the latter containing the copper. Did the ores there carry gold and silver, these two would go into the matte and be saved. It will be seen that the sulphuric acid process supplements the smelting operation beautifully, not only by suppressing the fume, which, as we shall see, has been a great drawback to metallurgical projects, but absolutely turning into money what was formerly a nuisance.

While this method is applicable to the conditions existing in California, there are many economic considerations to be reckoned with. Although these deposits are at a distance of 300 miles from the acid works, such are the facilities for mining, and so low the freight-rates, that the ore is delivered to the burners in or near San Francisco at a cost that will meet the competition of nearer 'sulphur ore', of as good character. The pre-war price averaged about \$5 per ton delivered for an ore carrying from 45 to 48% sulphur. These facts are significant in their relation to the mining industry of Shasta.

Working on a scale of 100 tons of pyrite daily, equivalent to the production of about 120 tons of 66° acid, the cost of crushing and calcining the ore would reach, in a well arranged and well conducted plant, about \$1 per

ton, if mechanical furnaces were used, while it might be done for a little less if kilns were employed. To this amount the loss in valuable metals must be added in order to obtain an idea as to the relative advantages of the methods. This loss is the sum of the values of the copper and precious metals, less the customary losses in smelting, which might be 2 or 3% of the gold, 4 or 5% of the silver, and one-third of the copper. The last item is large, because ore of low tenor loses proportionally more than the high-grade. The actual yield of copper from an ore carrying 1.5% copper would not exceed 22 lb. per ton, which, being in the form of matte, would have to be re-smelted and refined, and submitted to deductions, so that with the gold and silver (say \$1.60) added, the net yield would be about \$3 per ton. But vast quantities of sulphide ore of hardly higher grade than this have been smelted in Shasta county at a profit. The average charge to the furnace contains but 3% copper, with an average of 90c. in gold, and 1.25 oz. of silver; but because it contains an average of 4% zinc it is more difficult to smelt than the comparatively pure pyrite of which we are now speaking. These ores require silicious flux to the extent of about one-fourth of the charge; and while richer quartz is desired for this purpose, the smelters have to take large quantities of vein-quartz that may carry no more than a dollar or two per ton. A certain property has delivered to a Shasta county smelter within the past year several thousand tons of quartz assaying only \$2.50 per ton in gold and silver, and has achieved a profit after mining, transporting, and paying treatment-charges upon it. It is a wonder that it can be done at all, in view of the high cost of coke and labor.

Not only have the quartz mines of Shasta county been put under contribution for supplies of acid flux, but silicious ores in considerable quantity have been imported from distant regions. These ores, however, are of much higher tenor and have to bear much heavier freight-charges. On the other hand, much basic ore, the ordinary mixed sulphides of the district, has been exported to points so distant as Salt Lake. This shuffling about of ores of different characters according to the exigencies of the metallurgical process is one of the most interesting characteristics of modern practice, and illustrates better than anything else the special advantages of smelting methods. The Mountain Copper Co. has the distinction of being the first to adopt thorough methods of mitigating the fume evil, and of utilizing to the utmost the sulphur content of Shasta ores. Its complete plant at Bull's Head, near Martinez, in Contra Costa county, California, was designed not only to manufacture sulphuric acid from the fumes of smelting and roasting furnaces, but to convert the acid to industrial uses, through the manufacture of a fertilizer, familiar to agriculturists under the name of Mococo, the base of which is superphosphate of lime. The process consists in roasting the ore, receiving the smoke therefrom in suitable apparatus, by which it is made into acid, and then treating pulverized native lime phosphate with it, by which a portion of the phosphoric acid is set free, but still left in ad-

*'Calumet & Arizona Sulphuric Acid Plant', by Courtenay De Kalb. M. & S. P., March 30, 1918.

mixture with the calcium sulphate coincidently formed. The addition of substances containing potassium and assimilable nitrogen converts the super-phosphate into what is styled a 'complete fertilizer'. The scarcity of native phosphates in this State compels the company to go as far afield as Idaho, where it has acquired deposits, and whence it draws large supplies.

The accompanying photographs show the extent of plant necessary, with wharf facilities, slag-dumps, and the smokestack, which is 225 ft. high and is constructed of reinforced concrete. An interesting item is the old sheet-iron stack, in its crumpled condition, resulting from the action of sulphur gases through a series of years.

METHODS AT THE AFTERTHOUGHT. This mine, 20 miles north-east of Redding, ever since its discovery by C. M. Peck in 1872, has been one of the most noted mines in the State, not by reason of its magnitude, for there are many larger, nor for its production, for there are many more productive, but chiefly because there is always something doing at the Afterthought—something novel in a metallurgical way. It has been the scene of numerous experiments, chiefly on account of the refractory character of the ore, which consists of a mixture of chalcopyrite, pyrite, blende, and barite, with some of the usual derivatives of the country-rock, and is therefore similar to that of other deposits in the base-metal range. The contents in gold, silver, and copper are sufficiently generous to encourage extensive mining operations, which have not done so well. The earliest attempt to reduce the Afterthought ore took place soon after the discovery, when a 10-stamp silver-mill was erected. Success was not achieved, owing to the scarcity of oxidized material, which, however, seems to have been of good grade. Roasting was soon tried, but apparently without success, since the unusual step was taken of smelting the roasted and also the naturally oxidized material in a reverberatory furnace, using wood as fuel. This was a commendable step, resting on good metallurgical precedents, and, given sufficient skill and experience, it should have succeeded. It is true, wood is not a good fuel for reverberatory smelting, being surpassed by bituminous coal, and far surpassed by petroleum and producer gas, but the reverberatory furnace is superior to the blast-furnace in treating zinky ores, and especially those containing barite, as at the Afterthought. At that time wood was being used on a large scale in the reverberatories at Black Hawk, in Colorado, whence, no doubt, the local practice was derived. The settlement of Afterthought is embedded in a sea of trees, mainly fir and pine, whose wood, when seasoned, heats the furnace to the smelting temperature with fair readiness, but they are consumed with rapidity, it having required nearly a cord of dry fir to smelt a ton of ore in the old and ill-designed reverberatories at Butte. A furnace of modern design would use hardly more than one-third that, and might therefore perform its work with an economy comparable with that of the oil-burning [now powdered coal] furnaces at Ely, or those at Butte, which are heated by powdered coal. It is a great pity that this well-meant

attempt was not continued, for although the abundant zinc in the Afterthought ore would have proved a serious obstacle, this method even now is far preferable, under the circumstances, to the blast-furnace process that succeeded it. The first blast-furnace, I am told, was put up to use lead as a collector—a seemingly incredible thing in view of the presence of ample amounts of copper sulphide in the ore, but not incredible when we consider the condition of metallurgy in that day, when common opinion held that lead, and lead alone, could extract the precious metals. This erroneous view was widely held, and prevailed for many years thereafter. Some unimportant deposits of galena in the neighborhood may have instigated the attempt, which came to nothing, and not long after a larger cupola furnace was erected, the locality becoming known as Furnaceville. Some ore was shipped to Swansea, it is said, and the respectable sum of \$450,000 was reported to have been received for it, the total sales having been 11,000 tons. Various spasms of activity followed, and three or four other furnaces were set up, of which sundry relics survive.

It was my fortune to have examined this district over 20 years ago. Samples were taken from every working breast and from the small heaps of roasted ore scattered on the hillside. The property was in the hands of Joseph Enright, widely known as the builder of traction-engines, of the Shasta county lumber-flume, and of the Anderson-Bella Vista railroad. The assays will show the character of the ore handled during those early years.

From similar ores the first smelter produced three carloads of matte, which was sold in San Francisco. The three carloads assayed from 0.33 to 0.92 oz. gold, 72 to 83 oz. silver, and from 49 to 60% copper. It is interesting to know that the railway charges were \$7 per ton, the treatment charge \$20.50, that the gold brought \$20 per ounce, the silver 95% of the New York quotation, and that the whole shipment, amounting to 54 tons, the sum of \$5757 was received. These terms compare well with the present, excepting that the treatment-charge has been reduced to \$3 or \$4 per ton.

After many efforts the managers came reluctantly to the conclusion that the zinc content was too high to admit of smelting by either the pyritic process as later practised, or the roasting-smelting method as carried on at first. The comparatively high-grade material had been measurably exhausted, but, development continuing, they had to face the problem of reducing ore carrying 2.8% copper, 11.6% iron, 15% zinc, 18% sulphur, 11% silica, 7.4% barite, and 5.6% alumina, with \$4 to \$5 in precious metals. Of this material immense quantities exist and are well opened up, and provided with a

railway one mile long for transport to the site of the works, which is upon the left bank of Cow creek, and upon a steep side-hill. A little calculation will show that rather more than half the ore consists of sulphides, and that serious obstacles to reduction exist. This being the case, it is not surprising that much experiment and research have been given to other processes, in the hope that some way would be found to overcome the various difficulties. It is apparent, at once, that no method of dressing would be applicable, since the concentration could not extend beyond the removal of the gangue, which constitutes less than half the weight whereby a ton of product would be obtained from two tons or less of ore. The enriched product, therefore, could not contain more than 6% of copper, with six or eight dollars in gold and silver, and might not pay either to ship or to smelt. The zinc having previously been a waste product, its recovery in commercial form became a matter of great interest and absorbed the attention of the operators, in view of the fact that the mine contains many millions of dollars worth of that metal, whose presence makes the associated metals valueless. Herbert Haas, formerly metallurgist to the company, and introducer of the pyritic method there, after prolonged study, gave his opinion in the following words: "All attempts at concentration failed, the ore being a very intimate mixture of blende and pyrite, which resisted electro-static and magnetic concentration. Hand-picking and wet concentration were equally unsuccessful, for even the finest particles showed the intimacy of the blending. It was noted that the zinc concentrate contained more of the copper and silver of the original ore than the pyrite concentrate held, while the latter could never be obtained even reasonably free from blende." Mr. Haas at that time looked forward to a chemical separation of the zinc, prior to smelting the residue for its copper, gold, and silver. Other tests followed, and various processes for extracting the zinc were suggested, but nothing came of it beyond the co-ordination of ideas, and the mine laid practically idle until taken over by the present company, styled the Afterthought Copper Mining Co., composed of Eastern people, who, supplied with ample funds, are now carrying on a prodigious experiment in flotation, which is attracting great attention, both from the novelty of its principles, and from the costliness of its plant. The method is a form of selective flotation, in which it is designed to form three products, two of which, the zinc concentrate and the copper concentrate, are valuable, the other, the waste, valueless, by means of two successive applications. The plant has a daily capacity of 300 tons of ore, and has cost to date more than \$500,000. The work is interesting indeed, and merits a full description.†

Some special characteristics of the Afterthought property demand notice. The distance to the railway is 13 miles, the wagon-road is far from good, and connection is made with the main line of the Southern Pacific railway by means of a branch line. These artificial disad-

vantages are offset by certain natural advantages, among which are the propinquity of fuel supplies—wood and coal—of water, and incidentally of a flume, which, passing immediately in front of the works, enables timbers and sawed lumber to be delivered at low rates and in large quantities. To this may be added the advantage of cheap and abundant supplies of electricity from power-plants not far away.

An important feature of the treatment at Ingot (as the mill-site is called) consists in roasting and then smelting the copper concentrate, which is deemed too low-grade to stand the cost of shipment. The smelting process is to be carried out in a reverberatory furnace, patterned after those used at Garfield, Butte, Ely, and other copper-smelting centres. It is 60 ft. in length of hearth by 18 ft. in width. Such a furnace should smelt about 250 tons daily of an average charge, and so will prove ample for all probable requirements. The fuel is to be petroleum, which will cost about \$3 per barrel, and one barrel or a little less should smelt a ton of charge. Oil, of course, is a convenient and effective fuel, which every furnace-superintendent likes to use, but it is pertinent to inquire if, considering the abundance of other fuels at that point, a cheaper one could not be used. By the aid of the flume, which is right at hand and no more than 100 ft. from the furnace, an ample supply of good wood can be secured, at a cost probably much below that of an equivalent amount of oil. A cord of wood is worth two barrels of oil, but the cost of firing is greater. Direct firing with wood may not answer on so large a furnace, but if not, then it may be converted into gas by means of a producer, with results as good as oil can give. The apparatus might be less convenient, but economy and not the convenience of operators is the object. Producer-gas from resinous woods can be made to contain 125 to 135 heat-units per cubic foot, thereby equalling that made from coal. It would seem that if there were a really favorable opportunity to make use of the gas-producer it is at Ingot; for not only is wood found there in immense quantities, but there is a coal mine within a few miles, which should have a great influence on the metallurgy of the local ores.

[See illustrations on pp. 59 and 60]

Cost of producing silver at the Nipissing mine at Cobalt, Ontario, is as follows, according to the annual report:

| | Per ton | Per oz., cents | | Per ton | Per oz., cents |
|--------------------------------|---------|-------------------|-----------------------|----------|-------------------|
| Exploration | \$1.329 | 2.92 | General, legal | \$0.159 | 0.35 |
| Drilling | 0.246 | 0.54 | High-grade mill | 1.778 | 3.91 |
| Development | 0.897 | 1.97 | Low-grade mill | 5.037 | 11.08 |
| Stoping | 1.282 | 2.82 | Depreciation | 0.725 | 1.59 |
| Hauling dumps | 0.082 | 0.18 | Marketing | 0.826 | 1.82 |
| Shipping residue, etc. | 0.041 | 0.09 | Corporation, etc. .. | 0.254 | 0.56 |
| Assaying, etc. | 0.122 | 0.27 | Total | \$18.128 | 39.87 |
| Management | 0.525 | 1.15 | Less sundries | 0.387 | 0.85 |
| Camp | 0.112 | 0.25 | | | |
| Insurance, taxes .. | 4.713 | 10.37 | Net cost | \$17.741 | 39.02 |

The total cost of production was 35.75% of the gross value of the output.

Development of vein 109 in the Nipissing has opened a long shoot of 3000-oz. ore, adding considerably to the ore-reserves.

†Which will be published in this paper shortly.—Editor.

Oxy-Acetylene Welding of Large Cylinders

By L. M. MALCHER

One of the big steel-rolling mill engines at the Farrell works of the Carnegie Steel Co., at Farrell, Pennsylvania, that had been doing its full share in helping to win the War broke down two weeks after the signing of the Armistice, having worked constantly up to then on 100% war orders. In the accident, besides other parts, the left-hand low-pressure steam-cylinder, 70 in. inside diameter, of an Allis-Chalmers twin-tandem compound-reversing engine was badly fractured, in consequence of the breaking of a connecting rod at the moment of reversal.

A serious situation confronted the officials of the Carnegie Steel Co., as it would have taken at least three to three and a half months to obtain a new cylinder, in case the broken one could not be repaired in a shorter time; 360 men were thrown out of employment. The broken cylinder was of such size and the damage done was of such character that a decision whether the cylinder was to be renewed or repaired involved a risk on the part of the management. Although considerations of expense as between the cost of purchasing a new cylinder and repairing the old one were of secondary importance, the cost of repairing was estimated to be about one-third that of a new cylinder.

The officials of the company, after careful investigation, decided in favor of oxy-acetylene welding. They called upon the job-welding shop of the Oxweld Acetylene Co., at Chicago, to meet the emergency. Three expert welders, accompanied by all the necessary equipment, went immediately to Farrell and completed the job under my direction. The total time consumed in repairing the low-pressure cylinder, including chipping, pre-heating, and welding, was 72 hours. While dismantling the engine, a fracture was discovered in the right-hand, 42 in. diam., high-pressure cylinder. This fracture also was repaired in about 18 hours. It took just seven days, from the time the order was given to complete the entire job.

The data covering this work are given in detail below:

Low-Pressure Steam-Cylinder

5000 hp. Allis-Chalmers twin-compound reversing engine. The horsepower given is the maximum developed while rolling and running at about 100 to 110 r.p.m.

| | |
|-----------------------------------|--------------------|
| Cylinder bore | 5 ft. 10 in. |
| Stroke | 4 ft. 6 in. |
| Weight of cylinder | 13 tons |
| Thickness of iron casting | 2 3/4 to 3 3/8 in. |
| Number of cracks (See Fig. 1) | 7 |
| Total length of all cracks | 22 ft. 2 in. |
| Preparing and pre-heating casting | 27 hours |
| Welding casting | 45 hours |
| Linde oxygen consumed | 2850 cu. ft. |
| Prest-O-Lite acetylene consumed | 2845 cu. ft. |
| Oxweld cast-iron welding-rods | 390 lb. |
| Oxweld 'Ferro' flux | 25 lb. |
| Number of welders | 3 |
| Period of welding shifts | 10 and 30 min. |

High-Pressure Steam-Cylinder

5000 hp. Allis-Chalmers twin-compound reversing engine.

| | |
|--------------------|-------------|
| Cylinder bore | 3 ft. 6 in. |
| Stroke | 4 ft. 6 in. |
| Weight of cylinder | 5 tons |

| | |
|---|----------------|
| Thickness of iron casting | 3 1/2 to 6 in. |
| Piece of flange broken off (See Fig. 3) | 4 ft. 6 in. |
| Total length of weld | 9 1/2 hours |
| Preparing and pre-heating casting | 8 1/2 hours |
| Welding casting | 650 cu. ft. |
| Linde oxygen consumed | 650 cu. ft. |
| Prest-O-Lite acetylene consumed | 110 lb. |
| Oxweld 3/4 in. cast-iron welding-rods | 10 lb. |
| Oxweld 'Ferro' flux | 3 |
| Number of welders | 10 and 30 min. |
| Period of welding shifts | |

While welding inside the cylinder castings, the men relieved one another every 10 minutes because of the extreme heat deflected back on them during the operation. On the outside welding, however, the heat was not so intense and the men relieved one another every 30 minutes.

After the engine-cylinders were machined, it was almost impossible to determine where the cracks had been. The total cost of this repair represents but a small fraction of the replacement cost, but even this saving is insignificant when compared with the disorganization that would have resulted from the laying off of a large body of trained workmen and with the enormous loss that would have been entailed in a stoppage of production.

[See illustrations on pp. 61 and 62]

Recovery of Zinc From Ores

Zinc recovered from sulphide ores in Utah and adjacent States is mostly from mixtures of lead and zinc sulphides. The usual milling treatment for such ores is to crush, size, and classify the ores, and then separate as cleanly as possible the gangue from the sulphides with jigs and tables. By this separation of a mixed sulphide ore, a lead product and a zinc product are obtained. Sometimes the lead contains as much as 10% zinc, or even more, and the zinc contains a considerable quantity of lead. The zinc that accompanies any lead ore sent to the lead smelter is not recovered. Therefore the problems connected with the milling of a zinc sulphide ore are as follows: (1) effecting a better separation of the lead and zinc materials; and (2) preventing losses of zinc or of lead and zinc in the tailing.

If an ore cannot be rendered marketable by concentration processes the next step is to devise a process for treating the ore locally, that is, near where the ore is mined, so as to do away with the costs connected with transporting the ore and the subsequent smelting of it. In general, if an ore cannot be treated at a profit by a smelting process a hydro-metallurgical process is devised. Hydro-metallurgical treatment of zinc sulphide ores has been proposed in many different forms during the past half century, but has in general failed to be adopted, on account of the peculiar chemical properties of zinc and the low value of the products that can be made. Zinc requires more chemical or electrical energy, in comparison with its value after recovery, than almost any other major metal on the market; and the high consumption of chemicals or of electric energy involved in its recovery has usually made hydro-metallurgical processes of questionable value.—D. A. Lyon and O. C. Ralston in Bulletin 148 of U. S. Bureau of Mines.

Briquetting Magnetite Concentrate

By F. H. MASON

It is becoming generally accepted that the establishment of an iron and steel industry is exceedingly desirable if not absolutely essential to the well-being of other industries that were established during the War on the northern Pacific Coast. The difficulty, however, has been that, while there appears to be plenty of both coal and iron available, most of the iron ores are of the magnetite variety, which are not by themselves suitable for smelting in the blast-furnace. The British Columbian government, realizing this, employed Alfred Stansfield, professor of metallurgy at McGill University, to investigate conditions and make a report on the feasibility of smelting British Columbian magnetite in an electric furnace. While Mr. Stansfield's report has left things pretty much in *statu quo*, the perusal of it reminded me of some experiments that I made over twenty years ago on the magnetic sand that occurs at a number of points along the coast of Quebec and Labrador, and it struck me that the final result of these experiments might be of assistance in evolving a plan for the smelting of magnetite in the North-West.

This magnetic sand was composed principally of magnetite mixed with ilmenite, garnet, and silica, and it was found that by magnetic concentration they could be enriched up to about 66% of iron. The difficulty, however, was the briquetting of the concentrate into a form sufficiently solid to stand the burden of other ores in the blast-furnace without crumbling, for the idea at the time was to smelt them together with the hematites and limonites that occur in Nova Scotia, and any metallurgist will realize the danger of introducing structurally weak briquettes into the blast-furnace. It occurred to a client of mine, whose name, if I remember rightly, was Armstrong, that the difficulty might be overcome by mixing the concentrate with a strongly caking coal in a coarsely powdered form and coking the coal, thus embodying the concentrate within the coke. In carrying out this idea I selected washed coal from the Intercolonial Coal Co.'s Drummond mine, at Westville, Nova Scotia, which was about the most strongly caking coal in the Province. It produced a remarkably tough coke. This I mixed in varying quantity with the concentrate and coked it in the crucible of a wind-furnace, the object being to find the least quantity of coal that could be used and still produce a strong coke. I found that with Drummond coal it was possible to use as much as two and a half parts by weight of concentrate to one part of powdered coal and obtain a ferruginous coke that would be capable of bearing the burden of other ores in a blast-furnace. The crucible was allowed to remain in a reducing atmosphere in the furnace for some time after the hydro-carbon gases had been burned off, and this undoubtedly reduced some of the magnetite to metallic iron, and contributed toward the strength of the resulting coke.

Having apparently solved the problem, we found to

our chagrin that someone else had thought the scheme out ahead of us and patented it. The Wabana mine on Belle island, Newfoundland, was being opened up at this time, and, soon after, ore from it was being put on board ship for 29 cents per ton, so interest in Labrador sand flagged, and the matter was allowed to drop.

Looking at those experiments in connection with the treatment of magnetites on this Coast, they have an entirely new significance. For his report the British Columbian Department of Mines provided Mr. Stansfield with the information that there would be no difficulty in providing 50,000 tons per year of magnetite running 50 to 55% of metallic iron. If it were possible by crushing and magnetic concentration to increase the iron content of such ore to between 65 and 70% without serious loss in the tailing, the decreased quantity of material to be smelted would go a long way toward covering the cost of crushing and concentration, if it did not entirely do so, and the magnetite would be in exactly the right form to mix with powdered coal. To prevent the magnetite by reason of its greater density from becoming separated from the coal and falling to the bottom while being charged into the coke-ovens, probably it would be necessary to add sufficient tar or crude oil or other binder to make the whole sticky.

During the process of coking, the magnetite would be in an incandescent state and in intimate contact with hydro-carbon gases and coke produced from the coal, and thus undoubtedly would be reduced wholly to spongy iron. While the coke and iron sponge was being projected from the ovens and quenched in the usual way, a portion of the iron sponge would become re-oxidized, but this oxide, of course, would be reduced again easily in subsequent operations. The product thus obtained would consist of carbon, spongy iron, and any impurities contained in the original concentrate and coal, and it could be melted in the blast-furnace or by other means.

The foregoing is offered, of course, only as a nucleus from which by experimenting a process may be evolved. The patents must have lapsed before this, so the idea, such as it is, is at the disposal of the metallurgical profession.

ZINC SULPHIDE resists most ordinary solvents, not being dissolved with sufficient rapidity by any of the commercial acids, hence requires roasting before the majority of the proposed hydro-metallurgical processes can be applied. Sulphide of zinc is one of the most refractory sulphides to roast, on that account the cost of zinc roasting is higher than that for any other major metal. In order to get the zinc into solution after roasting, it may be converted into a sulphate or a sulphide, or hydrochloric acid may be used as a solvent for the leaching of zinc sulphide ores in localities having industrial plants where acid is a useless by-product. Hydro-fluosilicic acid is also recommended [it is used at Trail, B. C.] as being a desirable solvent for roasted zinc ores, on account of the ease of precipitating zinc from solutions by electrolytic methods.—D. A. Lyon and O. C. Ralston in Bulletin 168 of U. S. Bureau of Mines.

Progress in Methods of Exploration

By HUGH M. ROBERTS

Methods of mineral exploration in recent years have undergone developments that are on a par with those in other branches of the mining industry. This progress has not been so generally realized nor has it received so much attention as the refinements that have taken place in the art of fine grinding or the innovations in oil-flotation. While the decline of prospecting has been discussed continuously in mining periodicals, but few of these discussions have touched upon the modern practice of mineral exploration which has grown up in its place. The subject is important because the continuance of every mining enterprise is ultimately dependent upon the finding of new orebodies. The day has gone by when ore deposits were disclosed by the chance removal of turf or by the sinking of a shallow test-pit. These were the opportunities of a past generation. The restriction of these opportunities has led to a keen study of the principles of economic geology and the development of better practice in exploration.

In particular, it is the purpose of this article to trace the increasing effectiveness of the diamond-drill as an exploring instrument. Not only have there been mechanical improvements in the drilling process, such as the increased efficiency of drilling-engines, the introduction of special devices for recovering core as the double tube-core barrel and the invention of the Maas compass for the surveying of drill holes, but on the more strictly mining engineering side, new methods of securing accurate results in sampling have been devised by the combining of the assays of core and cuttings. Also, by the introduction of the core-splitter, it is now possible to preserve a complete uncrushed sample of ore for geological purposes without interfering with the accuracy of the analysis. A carefully taken diamond-drill sample is, thus, superior in accuracy, convenience and usefulness to any other type of ore-sample. The matter of differential selection in sampling is largely eliminated, for the diamond-bit cuts through everything in its path with rigorous impartiality; but a diamond-drill sample must be recovered by experienced drill-men who are capable of applying some degree of ingenuity to meet conditions. The design of an effectual sampling process to fit any particular set of conditions usually requires the science of the mining engineer in addition to the mechanical ingenuity of the drill-man. The nature of the rock-formations surrounding an orebody, as well as the character of the ore itself, is a determining factor in the choice of the size of bits, methods of core recovery, varieties of casing, and the means for the recovery of cuttings. As various types of oil-flotation are adapted to particular kinds of ore, so must drilling methods be

varied for the particular conditions under which the gold ores, iron ores, copper ores, and coal are found to occur.

After all, even the sampling process must be preceded by the finding of an ore deposit. For unraveling problems of general geology and ore deposition, the diamond-drill is the weapon above all others. As the knife to the surgeon, it is useful for the revealing of facts and for the elimination of barren ground. It furnishes systematic geologic specimens which may be taken at any angle from any position underground or on surface. In the scope of its possible moves, the diamond-drill may be likened to a chessman which moves in any direction, and for any distance between 10 and 3000 ft., taking whatever lies in its path. An exploratory campaign is singularly like chess in that any possible move may be made at the beginning, but as the game grows, the facts point out and compel the subsequent positions. Used as a scout, that is, in the form of a light portable outfit, suitable for rapid shifting from place to place, the diamond-drill may be made an extension of the prospecting pick for the purpose of gathering rock specimens which will permit the working out of areal geology in drift-covered districts, and in areas where the wash of mountain streams has concealed the underlying formations; also, in regions where the productive horizons are covered unconformably by later flat-lying strata of no consequence.

By utilizing the diamond-drill, it is possible for a mining organization to test many properties that have been turned down by reason of insufficient evidence. It is possible to go one step beyond the ore 'in sight' and deal with the uncertainties of ore deposition in an effective but not costly manner. Thus, by actual initiative, the opportunities for developing valuable orebodies may be greatly increased and their discovery not be left merely to chance and sporadic efforts on the part of the visionary, or of accident in connection with old mine-workings.

One swallow does not make a summer, nor will one diamond-drill hole determine the grade and tonnage of an orebody. Neither will one moil-sample in a drift determine the grade and tonnage of an orebody. A sufficient number of holes must be drilled to furnish the facts for thorough going decisions on the basis of average results. The work must be carefully planned for the particular problem in hand.

In the speed and facility with which definite results can be obtained, diamond-drilling excels any other known method of getting the facts. The rock must be exceedingly tough or troublesome because of caving in which it is not possible to advance the bit 10 or 20 ft. per shift. By using several drills, it is possible to attack the prob-

lem from different sides simultaneously. Thus, true conceptions of the nature of the orebody may be speedily obtained and plans made at once for mining methods and metallurgical processes. As time is of the essence of a contract, so in many mining enterprises, time is the chief factor. The use of the diamond-drill makes it possible to get results while the irons are hot.

Again, the portability of the diamond-drill permits it to be taken into inaccessible country, in fact, anywhere that a canoe or mule can go. The machine can be taken to pieces and transported in small parts. The growing use of the gasoline engine for power, solves the problem of fuel in many desert regions. Ore deposits may be developed in advance of roads and railways. In the Pas region of northern Manitoba, the railroad is being projected into the ore-bearing district because diamond-drilling has shown the existence of large tonnage of copper-bearing sulphides.

The diamond-drill has perhaps attained its widest field of usefulness in the Lake Superior region. At present, in this district, nearly every large mine keeps at least one drill constantly at work in advance of development. The drill has played a prominent part in the discovery of the iron ore deposits of Michigan and Minnesota. As a means of working out the complicated synclinal structures of the Menominee, Marquette, and Vermilion ranges, where high-grade deposits of iron ore are found, the diamond-drill has been most useful. The dike-controlled orebodies of the Gogebic range have been searched in many instances by drilling. On the Mesabi, many mines would, no doubt, still be today merely cut-over cedar swamps were it not for the application of systematic drilling methods. The Cuyuna range was developed by drilling in connection with magnetic attractions that gave a clue to the presence of the iron formations, which occur beneath glacial drift.

The copper deposits of the amygdaloidal flows and conglomerate beds of Keeweenaw Point in northern Michigan have been successfully explored by long horizontal and deep angle holes sometimes extending for distances of 2000 to 3000 feet. Many of the large nickel-copper sulphide masses of the Sudbury region of Canada have been found by the use of the diamond-drill, and mine development is directed on the basis of systematic drilling. In the Porcupine district of northern Ontario, the soft serpentines and gold-quartz lodes are all carefully explored by the diamond-drill in advance of mine-workings. The positions of many of the narrow silver veins of Cobalt have been determined by drill-holes. Many of the deposits in the districts mentioned are concealed by Glacial drift and occur in connection with rocks of intricate geologic structure. For this reason, the direction of exploratory work has become specialized and has gradually devolved upon mining engineers and economic geologists who have given their whole attention to this branch of technology.

As an example of the efficacy of the diamond-drill in the exploration of the disseminated copper deposits, the work at Ajo, in Arizona, for the New Cornelia Copper

Co., is of particular interest in that it shows two results: the nature of the orebody was proved both quickly and accurately. As described by Ira B. Joralemon* the work began in the fall of 1911 and continued up to September, 1913. He says:

"The Calumet & Arizona Mining Co. developed the disseminated orebody on the New Cornelia property by diamond-drill holes and by test-pits. The probable ore-bearing ground was co-ordinated with east-west and north-south lines at 200-ft. intervals, and drill-holes were sunk at the intersections of co-ordinate lines. The drilling was done under contract by the E. J. Longyear Co., of Minneapolis, Minnesota. Sampling was under the direction of representatives of the Calumet & Arizona Mining Co. Drill-holes were sampled in 5-ft. sections. All of the flow of sludge was caught in barrels and settled. When the end of the 5-ft. section was reached the water in the barrels was decanted off and the sludge-sample was dried and quartered down to three or four pounds. The rods were pulled at least every 5 ft., and core-samples were taken at even 5-ft. intervals where possible. Both core and sludge samples were sent to the assay-office of the Calumet & Arizona Mining Co., at Bisbee, for analysis. Small portions of both core and sludge for every 5 ft. of drilling were kept for future reference in labeled tin boxes. Owing to the thoroughly fractured, uneven nature of the rock, the recovery of core was low, and neither core nor sludge samples alone were satisfactory. To obtain an accurate assay-value for the ore developed, the length of core for every 5-ft. advance was measured, and on the basis of this length of core the sludge and core assays were combined to give a final value which represented all the material removed from the hole during the 5-ft. advance. The E. J. Longyear Co. furnished a chart which greatly simplified the work of combining core and sludge samples. Up to September, 1913, when development work was stopped, 84 diamond-drill holes had been sunk, varying in depth from 200 to 1000 ft. The total footage of diamond-drilling was 23,097 ft. Nineteen drill holes were stopped in ore. In all, 77 test-pits were sunk, with a total footage of 3955 ft. Of this test-pitting, 3606 ft. were in carbonate ore, and 349 ft. in sulphide ore; 1059 ft. of test-pitting checked drill-holes in carbonate ore, 175 ft. checked drill-holes in sulphide ore, and 2721 ft. were in advance of drilling. The total amount of drifting in sulphide ore was 1513 ft. The combined sinking and raising on drill-holes in sulphide ore amounted to 317 ft. The sinking, drifting, and raising proved that the value of ore indicated by drilling was very accurate. The channel-samples of test-pits in carbonate ore averaged 0.005% lower than corresponding diamond-drill samples; the test-pits and raises in sulphide ore averaged 0.05% lower than corresponding diamond-drill samples; and the drifts in sulphide ore averaged 0.26% higher than the assay-value of blocks of ore through which the drifts were run, as indicated by drill-holes at the corners

*Ira B. Joralemon: 'Ajo Copper Mining District'; Trans. A. I. M. E., 1914, Vol. 49, pp. 593-609.

of the blocks. In making the ore-estimate, diamond-drill samples were accepted wherever drilling was done, and channel-samples of test-pits were accepted where sinking was done in advance of drilling."

Later exploration in connection with this orebody has been done largely by diamond-drilling.

In many other mining districts throughout the world, the diamond-drill has been useful in the discovery of ore. However, it is not intended to multiply instances. Those which have already been cited are sufficient to show that the diamond-drill has developed into an exploring in-

enhance that fearlessness which must always accompany the search for new mines.

Magnesite in Washington

Extensive deposits of magnesite in this State were discovered during 1916. They are in Stevens county, a few miles west of Valley, on the Great Northern railway, and 50 miles north-west of Spokane. The enclosing rocks are slate, schist, and quartzite, and represent the replacement of dolomite by magnesite, according to F. M.

MINE OF THE NORTHWEST MAGNESITE CO., WASHINGTON

strument of the utmost flexibility and precision, equally useful in the earliest stages of an exploration and in the final mathematical determination of grades and tonnage.

It is also not difficult to see that the decadence of surface prospecting is inevitably in line with the trend of the times, because the opportunities for getting results by primitive methods no longer exist. Modern methods of ore-finding by the use of the diamond-drill will take the place of surface prospecting in greater degree. The increasing hazards of the future must be met by handling exploratory ventures on a scale commensurate with other modern undertakings, nor should these projects be carried out with timidity. If great discoveries are to be made, exploring campaigns must not be tied to the apron-strings of operating mines but must reach out and cover new country. Surely the development of effective methods of work does not necessarily work a curtailment of initiative. On the contrary, this development should

Handy. There are 12 known deposits beginning at a point 5 miles due west of Chewelah and running 10 miles nearly due south-west. Six of these deposits contain large bodies of good magnesite. The ore is quarried by open-cut methods.

The three principal operators are the American Mineral Production Co., the Northwest Magnesite Co., and the Valley Magnesite Co. These have spent large sums on development and equipment, the Northwest company alone spending \$700,000 in erecting a plant at Chewelah. During 1918 the output from this company's mine was 80,432 tons of crude ore, mostly converted into dead-burned sintered magnesite used by the steel trade for refractory purposes. The monthly capacity of the plant is 10,000 tons of calcined magnesite. There are six 125 by 7½-ft. rotary kilns, grinding machinery, etc. The ore is of the crystalline variety, similar to the deposits in Austria, according to Roy N. Bishop, the manager.

There is sufficient ore opened to supply the United States for many years.

Whether the property can operate successfully after the War will probably depend upon the attitude of the Government toward a tariff on this mineral, as the freight-rate from Washington to the Eastern seaboard at present is \$16.50 per ton, compared with the pre-war ocean rate of \$2 from Austria.

A Device for Excluding Excess Air From Roasting-Furnaces

STAFF CORRESPONDENCE

In the zinc-roasting department of the Anaconda reduction works, MacDougall furnaces, 20 ft. in diameter, are used to treat flotation concentrate carrying from 8 to 10% of moisture. The accompanying sketch gives an outline of the feeding equipment, in which an apron-feeder takes the material from the hopper and discharges

it directly into the furnace. Prior to the adoption of the present contrivance, the apron-feeder discharged into a covered chute, or hood, which was always giving trouble, as it extended from the top of the furnace to the apron, preventing proper observation of the latter. The hood also allowed excess air to enter the furnace, causing draft troubles elsewhere in the roasting-plant. With the device here shown, much of the excess air is excluded and an improvement in draft has been noticed; the apron-feeder is now accessible and exposed to view, so that its operation can be observed by the furnace-man.

The revolving door operates on the same principle as the door at a hotel entrance, from which, it is said, the idea was first obtained. As the apron-feeder travels, it discharges a panful of material at regular intervals onto the revolving door, the impact being sufficient to cause the door to spin around a half-turn or more, thus dropping the material into the furnace through the hole in

the roof. The revolving door is enclosed on four sides by light steel plate suitably attached to convenient framing. In the sketch, the curved side-casing only is shown, the covers for the ends not appearing. As little clearance as possible is allowed for the door to revolve in its casing.

The present construction of the revolving door is as follows: a piece of 1½-in. pipe has six ribs welded onto it; vanes made of ¾-in. plate, 2 ft. 6 in. long by 9 in. wide, are bolted onto the ribs, and a piece of 1½-in. shafting is inserted into the pipe. This shaft projects at both ends, and is made fast to suitable supports so that the pipe will turn on the shaft. As it is important that the revolving door may spin easily on the shaft, the latter is tapped for a grease-cup, which, when screwed down, forces lubricant between the shaft and the inside of the pipe. A cast-iron spider has been proposed as a better form of construction to carry the vanes, and will be adopted in the future.

Before actually trying this contrivance, it was anticipated that wet material would stick to the vanes till the door eventually clogged. This objection did not materialize, for the reason that the apparatus is kept hot and dry by being exposed to the gases inside the furnace. The originator of this clever device is George Lynn, machinist at the zinc-roaster.

Costs at the United Eastern

During 1918, this company, operating at Oatman, Arizona, produced 97,827 oz. of gold and 52,485 oz. of silver from 92,339 tons of ore, at a cost of \$8.501 per ton and \$8.02 per ounce of gold. The report of the general manager, J. A. Burgess, states that:

Mining costs were higher by 59 cents than in the year previous. This was caused by increases in power, labor, and supplies, amounting to 28 cents per ton; and by the increased amount of development done, which cost 50 cents per ton in excess of 1917. Decreased labor efficiency had a marked effect on costs, but it is difficult to give an accurate estimate of its importance in dollars and cents.

Milling costs increased 5 cents. This is more than accounted for by the increase in cost of labor and power, amounting to 8 cents per ton.

In indirect costs, the largest increase was in State taxes, which now amount to 69 cents per ton, an increase of 50 cents above last year's figure.

The principal adverse conditions that affected costs during 1918 were: (1) Increase in wages of approximately 10%, effective July 1, 1918; (2) increase in price of general supplies, approximately 10%; (3) increase in cost of electric power, 15½%, effective after May 1, 1918; (4) increase in State taxes, 300%; and (5) decrease in efficiency of labor.

The resultant of all cost variations was an increase of \$1.39 per ton in operating costs, but the foregoing analysis shows that there would have been a decrease in costs for 1918, had conditions remained as they were in 1917.

REVIEW OF MINING

ANCHORAGE, ALASKA

RAILROAD AND DEVELOPMENT PROGRESS.

A surveying party, under T. W. Secrist, has taken the field to continue location of the railway in the Broad Pass region. Rails are laid to Talkeetna, and grading is 85% completed from Talkeetna to Indian river. Progress is delayed by lack of funds, the filibuster in the last Congress having held up the appropriation. An emergency sum of \$2,000,000 was asked of Congress by the Secretary of the Interior to continue work till the end of the fiscal year—June 30—when it is expected that an appropriation of \$13,000,000 will be made sufficient to complete the road. This is \$9,000,000 more than the original estimate. [As published in the 'Press' of June 14, the House voted for \$1,964,350 to carry on the work.]

Considerable activity is indicated for the coming season. Many men are going to the hills to prospect, and companies holding claims upon which little was done during the War, are preparing to do exploratory work. The Willow Creek district will be especially active, with a number of new companies in the field.

Cache Creek will be stimulated by a wagon-road to be built from Talkeetna by the Alaska Road Commission, under jurisdiction of the War Department, if Congress grants the requested appropriation. The Cache Creek dredge will not operate this summer. T. D. Harris is on the ground superintending a change in the power system—from coal to hydro-electric.

M. A. Ellis of Seattle is operating a hydraulic plant on Cache creek.

Roads and trails are also planned from Talkeetna to the Iron Creek district; and the Broad Pass region, one of great possibilities, is being brought into more prominence as the railroad progresses. Completion of the line will see the beginning of a healthy development of the mineral resources of this large and promising region.

The discoverer, Joe Morris of Spokane, of the Le Roi mines at Rossland, British Columbia, in the late 'eighties, representing a company composed of himself, W. J. C. Wakefield, H. H. Boomer, A. Witherspoon, and W. A. Monroe, has commenced work on the Copper King and Talkeetna claims on Iron creek. They will do surface prospecting during the summer months, and propose to prospect the ground with a diamond-drill next winter.

William Martin of Seattle will continue to operate the mine and mill of the Alaska Free Gold Mining Co. in the Willow Creek district. The snowfall was exceptionally light during the past winter, and the season is two weeks earlier than usual on that account.

The Gold Bullion mill commenced operations on May 17. After many vicissitudes this property has been a marked success, largely due to competent management. N. D. Bothwell continues in charge.

W. F. Rock of Denver has taken over the Talkeetna claims, and will do 600 ft. of development. He will install a compressor and drills. Power will be derived from water.

The Mabel mine and mill has been sold to Loveland, Colorado, people. It will be known as the Loveland-Alaska Mining Co. Development is under way. A

THE FAIRBANKS DISTRICT, ALASKA, WHICH WILL BENEFIT GREATLY BY COMPLETION OF THE RAILWAY

cyanide plant to treat accumulated tailing is planned. H. M. Fickenger will manage the property.

A copper prospect on the west side of Cooks inlet, at Kamishak bay, will be explored this summer by Charles H. McNeil, who brought a large outfit, including horses, from Seattle, unloading at Seldovia. From Seldovia a small boat will transport the material across the inlet. Mr. McNeil was prospecting in this region when Mt. Katmai erupted in 1913. The ground was covered with ash, which lay on the snow and prevented its thawing during the entire summer. The party was in grave danger and suffered from sulphurous fumes and volcanic dust and lack of air.

James Girdwood will employ 60 men at the Crow Creek placer mine in the Turnagain Arm district. The mine did not operate in 1917, due to disturbed economic conditions.

The Hope district promises unusual activity in both quartz and placer mining.

An interesting prospect is being developed at Bird point on Turnagain arm, where a gold-bearing vein is exposed at low tide. A coffer-dam was constructed, and a shaft sunk on the vein to a depth of 45 ft., when an unusually high tide, accompanied by heavy ice-floes, took the dam out and flooded the shaft. An incline was then started above the high-tide level, and cut the vein at a depth of 80 ft., where it is 12 to 18 in. wide and shows good gold content.

DIVIDE, NEVADA

NAMES OF INCORPORATED COMPANIES.

The following list contains the companies incorporated to operate at Divide, and includes the principal properties in the district. Nearly all of them were registered during 1919, in the State of Nevada. The Belcher was formed in 1916, the Brouger in 1918, the East Divide in 1918, the Gold Reef in 1908, the Gold Reef and Gold Wedge in 1918, the Midway in 1912, the Nevada in 1917, the Tonopah Divide in 1912, and the Tonopah Hasbrouck in 1918.

CRIPPLE CREEK, COLORADO

VINDICATOR FINDS NEW OREBODIES.

Three important discoveries have been made by the Vindicator company during the past two weeks, according to the statement by the general manager, George Stahl. The first at the 1900-ft. level of No. 1 or main shaft of the Vindicator, is in ground south-east of the Lillie mine, formerly owned by the Lillie (C. C.) Gold Mining Co. of England, since defunct. The new vein is 10 ft. between walls, carries ore that will make screenings worth \$30 per ton, while the coarse rock will mill close to \$10 per ton. The second discovery was made at the 1700-ft. level of the Golden Cycle shaft, corresponding to the 1900-ft. of Vindicator No. 1. The vein is believed to be the same, but the ore was found 500 ft. east of the original discovery. The third orebody has been found on the 1400-ft. level, north of Vindicator No. 1 shaft, where one of the so-called 'townsite' veins, lying under the town of Independence, has been encountered, north-west of the shaft. All three discoveries are in virgin ground, with no work above or below, or near to these points. Vindicator shares have been active during the past week, and advanced 20 cents.

PORCUPINE, ONTARIO

LABOR.—LITIGATION OVER SLIME DUMPS.—ROAD CONSTRUCTION.

The feeling of unrest that has prevailed for some time among miners of northern Ontario fields culminated on June 12 in a strike at Kirkland Lake, where about 500 of the Union miners walked out on the refusal of the mine-owners to yield to their demands. These included a minimum wage of \$4.50 per day to underground workers, a 44-hour week, and recognition of the Union. Progress in the strike has been chronicled in the M. & S. P. The strike has also affected the Boston Creek district where work has been largely suspended. There is little danger of its being extended to other centres. Cobalt

miners, who had made similar demands, and threatened a walk-out, have agreed to remain at work until the Hon. G. D. Robertson, Federal Minister of Labor, has full opportunity to bring about a settlement. Porcupine miners have asked for a conference with managers, and intimated that they will not demand increased wages provided that the cost of living can be reduced. The proposed method of doing this is establishment of a company store. The influx of unemployed men from Sudbury, Kirkland Lake, and other points into Porcupine and Cobalt makes it highly improbable that any further strikes will be called.

COBALT.—Litigation that has been under way for over two years, between the Peterson Lake Mining Co. and the Dominion Reduction Co., over the ownership of slime from the Dominion Reduction mill on Peterson Lake ground, has resulted in a judgment by the Supreme Court of Canada confirming decisions of the lower courts in favor of the Peterson Lake. The slime is estimated to amount to 220,000 tons, and the silver content from 500,000 to 2,000,900 ounces.

TORONTO, ONTARIO

MINERAL PRODUCTION DURING FIRST QUARTER OF 1919.

Returns received by the Ontario Bureau of Mines for the three months ended March 31, are tabulated below, compared with the corresponding period of 1918:

| | Quantity | | Value | |
|---|-----------|-----------|--------------|--------------|
| | 1918 | 1919 | 1918 | 1919 |
| Gold, oz. | 113,387 | 98,188 | \$2,265,621 | \$2,026,536 |
| Silver, oz. | 4,114,856 | 3,105,002 | 3,740,843 | 3,152,700 |
| Copper, blister, lb. | | 1,724,631 | | 270,493 |
| *Copper in matte, tons. | 4,727 | 2,674 | 1,748,990 | 558,280 |
| *Nickel in matte, tons. | 9,677 | 5,610 | 5,806,200 | 2,692,800 |
| †Iron ore exported, tons. | 501 | 4,840 | 2,638 | 41,118 |
| †Iron, pig, tons. | 17,404 | 14,170 | 461,940 | 399,963 |
| Cobalt, metallic, lb. | 37,545 | 13,594 | 75,625 | 20,889 |
| Cobalt oxide, lb. | 81,760 | 127,954 | 130,486 | 186,036 |
| Nickel oxide, lb. | | 5,070 | | 1,421 |
| Nickel, metallic, lb. | 44,154 | 1,830,569 | 17,662 | 756,062 |
| Other nickel and cobalt compounds, lb. | 143,381 | 31,370 | 18,386 | 11,497 |
| Lead, pig, lb. | 60,283 | 567,716 | 5,066 | 34,684 |
| Molybdenite, concentrates, lb. | 17,410 | | 24,548 | |
| Total | | | \$14,297,905 | \$10,182,479 |

*Copper in matte was valued at 18½ cents and nickel at 30 cents per pound in 1918. For 1919 the values have been placed at 11 and 24 cents, respectively.

†Including briquettes. Total shipments of iron ore to both foreign and domestic points in 1919 were 32,376 tons valued at \$146,741.

‡Total output of pig-iron was 170,325 tons worth \$4,807,614. Figures in the table represent proportional product from Ontario ore.

The value of the mineral output of the Province for the first quarter of the year reflects the after effects of the War. Nickel and copper show a marked decline both in quantity and value. The position is expected to improve gradually. Silver production has decreased by over a million ounces, but the effect in valuation is not so great owing to the present high price of the metal. Cobalt and nickel oxides, metallic nickel, and lead show an increase in value over the 1918 figures. Fuller explanations are offered under the separate headings.

GOLD. Although the gold output shows a decrease of 24,104 oz., the outlook is such that a substantial increase may be expected for the full year. With the Dome mill now in operation at Porcupine and the Kirkland Lake and Tough-Oakes mills at Kirkland Lake, an improvement is anticipated for the half-yearly report. A great

deal of interest is being shown in the goldfields of northern Ontario, and much prospecting and development of new properties is going on. During the period, with the exception of a few days at the end of March, only two mills were operating at Porcupine, namely the Hollinger and McIntyre. At Kirkland Lake the Lake Shore and Teck-Hughes were the only mills at work. For the quarter 206,603 tons of ore were milled as compared with 262,577 tons in 1918. Of the total 94.5% was treated at Porcupine. In addition, 18,620 oz. of silver was recovered from gold ores.

SILVER. Silver from Cobalt and outlying centres was marketed to the extent of 3,080,104 oz. In addition, 24,878 oz. was recovered from the refining of gold ores and nickel-copper matte. Mines producing over 250,000 oz. are given in order: Nipissing, Mining Corporation of Canada, Kerr Lake, and McKinley-Darragh-Savage. Of these, Nipissing marketed over 1,000,000 oz. Some ore assaying over 8000 oz. per ton has been taken from the Foster mine, under lease to Campbell and Fairbairn.

Southern Ontario refineries treated 1257 tons of ore and concentrates, and 919 tons of residues, recovering therefrom 1,354,441 oz. of silver in addition to the cobalt and nickel compounds, as enumerated in the table. Although 170,478 lb. of metallic nickel were produced only 16,284 lb. were marketed.

The market for stellite, used for high-speed cutting tools, has fallen off since the War ended. New uses, however, are being found and a market developed for this product, which is an alloy of the metal cobalt.

NICKEL AND COPPER. There was 229,822 tons of nickel-copper ore raised and 226,954 tons smelted, compared with 354,689 and 325,386 tons, respectively, for the first quarter of 1918. The cessation of hostilities immediately resulted in a decreased nickel demand, and the period of reconstruction has not yet provided a market sufficiently large to absorb the war basis output. In consequence, there has been a great curtailment in production both by the International and Mond companies. The prices also have dropped appreciably, notably in the case of copper. Out of a total output of 12,529 tons of Bessemer matte, 2960 tons was refined at the Port Colborne plant of the International Nickel Co. of Canada, the products being metallic nickel, blister copper, silver, and gold. The last two mentioned are present in small proportion. Heretofore the only metallic nickel recovered in Ontario was the small quantity obtained by the several refineries which treat the silver-cobalt-nickel ores of Cobalt. Since Port Colborne plant commenced in July of last year metallic nickel has been produced within the Province from nickel-copper ores.

MOLYBDENITE AND LEAD. As a result of decreased demand for molybdenum and a marked decline in price, it has not been profitable to operate molybdenite mines since the close of the War.

The entire production of pig lead comes from the mine and smelter operated at Galetta by the James Robertson estate.

THE MINING SUMMARY

ARIZONA

Clifton.—The Stargo Syndicate has made payment to the owners of the Stargo Silver Belt Mining Co. for their 26 claims, which are $1\frac{1}{2}$ miles from Morenci. This property has shipped 1100 carloads of silver ore in the past, when worked by Mexicans. M. J. Hannon reported favorably on the property for the purchasers six months ago.

Courtland.—Twenty-five men are working on the O. T. Smith lease at No. 2 shaft of the Leadville Mining Co. It is reported that a good body of ore has been opened. A few lessees are working on other parts of the Leadville property.

Kingman.—The dry concentrating plant of the McCracken Silver Lead Mines Co. is now operating. Concentrate is said to carry 54% lead and 35 oz. silver. A large orebody has been opened, part of which is shipping ore.

J. A. Hammer is making preparations to start the Fay mine and mill. This property is 8 miles south of Kingman. There is said to be a considerable tonnage of \$40 ore available.

Twenty-five men are now being employed at the Rural Mines Co.'s property. A new road is being built, and preparations made to put up a 100-hp. double-drum electric hoist and compressor. A 100-ton mill is to be erected as soon as development opens sufficient ore.

Foundations for machinery necessary to sink the shaft to the 500-ft. level are being put in at the United American mine. Several veins outcrop on the surface and it is proposed to cross-cut these at the 500-ft. level. W. K. Redenour is general manager.

Miami.—Inspiration Consolidated pays \$1.50 per share on July 28. This amounts to \$1,772,950, and makes \$5 per share, \$5,909,835, for 1919, and \$31,305,915 to date.

Oatman.—The United Eastern Mining Co. has issued its report for 1918, the following being abstracted therefrom:

The operating officials are J. A. Burgess, general manager; W. O. North, assistant; B. D. Boalen, mine foreman; E. M. Bagley, mill foreman; L. E. Ward, master mechanic; B. C. Staiger, mining engineer; R. G. Davies, geologist; Wallace Keith, purchasing agent; and J. W. Bradley, chief clerk.

The gross income was \$2,080,923, and charges against same \$940,902, leaving an operating profit of \$1,140,021. Adding the previous balance of \$966,866, there was available \$2,106,887. Of this, \$713,343 was paid in dividends and \$540,617 as capital distributions, leaving \$852,927 to be carried forward to 1919. Current assets amount to \$872,775, and liabilities \$283,580.

Underground exploration totaled 3692 ft. Ore-reserves are larger than they were a year ago, and total 265,663 tons averaging \$24.34 per ton. The main shaft is to be deepened from the bottom—1177 ft. On account of the heat and high humidity of the air in the mine forced ventilation is necessary. Underground work cost \$4.728 per ton milled, of which \$2.818 was for labor.

The mill operated most satisfactorily, treating 253 tons per day (92,339 tons in all), extracting 96.95%. Improvements to classification have increased the capacity to 283 tons. The Crowe vacuum precipitation system effected a decrease of nearly 50% in consumption of zinc-dust. The cost

of treatment was \$2.216 per ton. Gold extracted amounted to 97,827 oz., and silver 52,485 oz. The ore averaged \$23.158 per ton. Operating costs totaled \$8.501 per ton, equal to \$8.02 per ounce of gold recovered.

Superior.—It is rumored that \$100,000, to be spent in development of the Queen Creek Copper Co.'s property, has been voted by shareholders. This sum will not be available until after peace is ratified, when it is expected that the British government will raise the present restrictions on raising capital for foreign enterprises.

Tucson.—After closing his option on the Purcell property at Tucson Buttes, 10 miles from Tucson, T. E. Kelso, has organized the Arizona-Tucson Mining Co., which will take over the claims. A considerable quantity of high-grade copper ore has been accumulated on the dump, awaiting a better market. This property is claimed to have a large area of high-grade ore extending over several claims, the ore being almost on the surface. Development at present is being carried on by hand. This property adjoins the Saginaw, which was drilled a few years ago by the Calumet & Arizona Copper Company.

S. D. Keeny, one of the directors of the Cababi Mining Co. and the Stratton Consolidated Copper Co. is making an inspection of the properties in the Old Hat district. The latter company expects to resume development in August, but will not be working full force till the road from Oracle has been completed.

CALIFORNIA

Alleghany.—An electric hoist recently put in 600 ft. from the mouth of the tunnel at the Mariposa mine, is in operation, and the company intends sinking 500 ft., and prospecting the ground from that point.

Caliente.—The Cove district of Kern county, 42 miles north of this place by wagon-road, is to receive attention from the Big Hill Mining Co., which is to develop the Lady Belle, Bull Run, and Jeff Davis claims. According to G. C. Brown, of the State Accident Commission, in the Los Angeles Chamber of Mines 'Bulletin' for June, in the last report of the State Mining Bureau, on Kern county, the Cove district is described as one of the famous mining regions of the county. The altitude ranges from 2600 to 5000 ft. The natural amphitheatre occupied by this territory is the characteristic which gives it its name. The formation consists of granite and slate, the former predominate. Nine lodes can be traced on the surface for a considerable distance, as the outcrops are bold. Large treatment plants will make this one of the big producing districts of Kern county, as an abundance of water from the Kern river for power purposes, topography suitable for open-cut mining, and ideal climatic conditions should afford low costs.

There are 12 patented claims in the district that were active gold producers 40 years ago, and have been worked spasmodically since then. The district is credited with a monthly production in the early days of \$75,000, with none of the workings more than 400 ft. deep. Production of some of the mines are: Lady Belle, over \$1,000,000 in gold; Bull Run, \$450,000, deepest workings 360 ft.; and Jeff Davis with \$200,000 from 200 ft. depth. The milling average was \$40 per ton, with high-grade ore yielding at times as high

as \$150 on plates, and concentrate \$400 per ton. The large low-grade lodes known to exist in the district, in addition to the possibilities of developing high-grade ore under ideal mining conditions, undoubtedly merit the attention of capital.

Colfax.—Pacific Gas & Electric Co. engineers are at the Spaulding dam above Emigrant Gap, in Nevada county, where preparations are being made to add 15 ft. to the 260-ft. structure that holds back the waters of the South Yuba. This is the third addition to its height, and, when completed, will increase the storage capacity over 10,000 acre-feet. There will be no increase in electric energy, the object of the company being to guard against a dry season. Four smaller dams at gorges on the edge of the lake will be raised proportionately.

Forest Hill.—A number of men are hauling chromite from this place to rail at Colfax. They say that returns on present low prices are satisfactory.

Nevada City.—Under the superintendency of A. Hoge the California Mining Co. continues to advance the tunnel into Harmony ridge from a point in Willow valley, close to town. This ridge, 20 miles long, has been famous as a gold producer by drift-mining. The company controls a tract of land four miles long and two wide, but the channel, judging from older workings, it is not believed will exceed 200 ft. in width. The tunnel is 6 by 8 ft. in the clear, in hard granite, and has reached a point 650 ft. in the mountain. The underground work is in charge of Charles Kistle and with light machinery is driving the tunnel ahead at the rate of 110 ft. per month. All the machinery is electrically driven.

Grass Valley.—All the mines resumed work on July 1, in accordance with the agreement of June 28. The Empire and North Star mines have greatly reduced forces, and will not be able to operate, except at a disadvantage, for some time. Large quantities of water had accumulated during the 15 days of enforced idleness, and it is now a question of draining the lower levels in order to extract ore. The basis of settlement is substantially the same as heretofore made public, as follows: (1) no bonus; (2) free market; (3) conferences before any proposed strike; (5) one-half pay during time lost on this strike. Section 4 reads: "We propose a percentage increase along the lines suggested by some members of your committee as follows: At the end of a year from date we will pay 10% of the total wages earned by every man who has worked for us continuously throughout the year." This was amended to read: "continuously on the pay-roll," thus protecting men on leave or sick. J. B. Bennett, chairman of the Mine Workers Protective League, will name a committee to close up all details of the strike and to have the agreement, as finally adopted, drawn up and signed by the respective parties. How the free-market idea—goods and supplies at cost—is going to work out is a problem for the future.

The Murchie property, a mile east of town, once famous as a gold producer, was sold on June 27 by the tax collector on account of delinquent taxes. R. E. Steele of San Francisco was purchaser, paying nearly \$6500. C. F. Humphrey of Pescadero is an associate owner. No definite plans have as yet been made public.—The West Point claims in the Rough and Ready district have been bought by T. S. Dorsey of Grass Valley.—The H. H. Noble mineral rights within the Nevada City limits were bid in by David Wildin.

Plymouth.—The Plymouth Consolidated in May treated 10,500 tons of ore, yielding \$61,100. The net profit was \$14,500. The main shaft was cleaned down from 1500 to 2600 ft., preparatory to sinking. On the 1600-ft. level the south foot-wall drift advanced to 770 ft., where the quartz pinched. The shoot was 136 ft. long, averaging \$10.25 across 144 inches.

Randsburg.—An extensive silver-gold deposit has been

discovered by H. Williams on the flats between the Rand mountains, 1½ miles east of the Yellow Aster mine and 3 miles north of Atolia. The lode has been traced for 6 miles and is from 60 to 80 ft. wide. Two shipments, assaying 64 oz. silver and \$17 gold, have been sent out. John W. Kelley, former sheriff of Bakersfield, and associates, have acquired the Williams property, and started exploration. Numerous claims have been located on the strike of the lode.

COLORADO

Ouray.—The Camp Bird company's quarterly report shows that new work covered 718 ft. The total length of drive east from the tunnel intersection of vein is now 2035 ft. The tunnel-level east extended from the end of the ventilating drift, a distance of 206 ft., is in vein of no commercial value, although containing irregular small shoots ranging in value from a few dollars to \$19—silver largely predominating. At a point 1800 ft. from the tunnel intersection a cross-cut was driven south a distance of 200 ft. before the basic andesite-breccia was disclosed, there being for the entire distance alternate quartz streaks and the altered andesite found in the vein and in close proximity throughout the mine. A cross-cut opposite to the north passed into basic andesite in a few feet, confirming the limit of vein in that direction. No value of consequence was disclosed in either of these cross-cuts. Conditions east of these cross-cuts have not been defined, nor will further attempt be made until natural ventilation can be obtained through a connecting raise of about 450 ft. with the ninth level, now in course by the tunnel company. Similar vein conditions pertain on No. 9 level over this point, where the vein splits, the value following the south branch. For that reason an effort was made to disclose this branch on the tunnel-level and raise in it for ventilation, but the disadvantages going with forced ventilation over a stretch of 2½ miles restrain further prospecting until this obstacle is removed. It is considered that vein widths are now identified with cross-cuts between points 1400 and 1800 ft. east of tunnel vein intersection, disclosing various widths, ranging from 6 ft. to 19 ft. The greatest width and best value centre at about 1500 ft. from the intersection, where for a short stretch there is a width of 19 ft., of which 10 ft. returns 0.06 oz. gold and 15 oz. silver. The remainder of the vein does not contain commercial ore. Raises at co-ordinates 1150 and 1185 have been advanced 21 and 26 ft., respectively. In the former, gold is negligible with 10 oz. of silver. The latter, while not exposing the full width of vein, is in a stratum 5 ft. in width, that returns 12 oz. in silver, but no gold of consequence. The ventilating raise is on the vein at co-ordinate 1410, and but recently started. The Tunnel company will now vigorously prosecute the work to a connection with the No. 9 level, and, owing to mechanical ventilating conditions, there will be little opportunity afforded the Camp Bird company to promote further development until after completion of this raise. The flow of water at the mouth of the tunnel is about 1075 g.p.m., making mostly along the line of the tunnel, there being little in tunnel-level east. There is a fair supply of labor, but wages in this district have again been advanced 50 cents per day, making \$4.50 the minimum wage scale.

IDAHO

Grangeville.—The Unity Gold Mines Co., in the Warren district, has opened 16 in. of high-grade ore on its 900-ft. level. The property is 49 miles from rail. J. H. Hawley is president and J. A. Czizek of Boise is manager.

Mullan.—The Consolidated Interstate-Callahan company is to resume operations at an early date.

MICHIGAN

Houghton.—Seven mines in the Copper Country are producing metal as close to normal as their working force will

permit. They are: Quincy, Mohawk, Wolverine, Victoria, Baltic, Trimountain, and Champion. Eight mines are producing copper at approximately half of normal. They follow: Calumet & Hecla, Isle Royale, Allouez, Centennial, Ahmeek, Osceola, Superior, and Mass. Fifteen active organizations have their properties closed down: Lake Copper, White Pine, La Salle, Franklin, New Baltic, New Arcadian, Hancock Consolidated, Winona, White Pine, Cass Copper, Wyandot, South Lake, North Lake, Cherokee, and Indiana. Five exploration properties are continuing development: Seneca, Mayflower, Old Colony, Naumkeag, and Michigan. With reference to the properties that have suspended, it should be understood that mines like the Hancock, Franklin, La Salle, and White Pine are keeping pumps at work, and could be re-opened and become factors, in copper output in a small way, on short notice. The Michigan is included in the list of exploration properties. It is a regular producer, but has a most important future possibility from an exploratory standpoint. More new ground was opened in the lower levels of the mines during June than in any month for two years. The most noteworthy fact in connection therewith is that the general physical condition is better than the average. This applies mostly to the lower levels of the older mines; it is equally applicable to the newer mines, or those working along new lines.

MINNESOTA

Duluth.—At the meeting of safety engineers here on June 20, Albert H. Fay, of the Bureau of Mines, addressed the assemblage on 'The Safety Engineer and Accident Statistics'. The total number of men employed in mines of the Lake Superior district during 1917 was 58,152 and in 1916, 56,787.

MONTANA

The mining industry, particularly in the Rocky Mountain region, with prices of metal increasing, has a bright future, according to A. E. Spriggs, former acting-governor of Montana, who was at Salt Lake City recently, and is now chairman of the State Industrial Accident Board. For some time business in Montana underwent a depression because of the low price of metals, but with copper increasing in value, conditions are improving. It is the opinion of a great many that the price of copper has gone as low as it will for some time. There is a feeling that much of the talk of immense copper stocks to a certain extent was propaganda. This, of course, has done a great deal of good, in that it caused a cut in the production of the red metal which is sure to help the price of copper. There is little doubt that copper will come back and that nothing can stop it. The increased value of silver and its assured future is causing many of the old properties in Montana to resume operations. Records show that at present, of the 74,000 men employed in the State of Montana, 50,000 are at the mines. These figures demonstrate the value of the mining industry to the State and the fact that conditions are improving.

Butte.—The different unions at Butte are to present demands to the companies for increased wages and changes in working conditions. Most contracts expired on July 1.

NEVADA

Austin.—The Austin Dakota company is contemplating erection of a mill at an early date. Large reserves of silver ore are exposed. C. F. Littrell is manager.

The Austin Nevada Consolidated's Hiawatha tunnel has opened shipping ore. The general manager, H. G. Richardson, is to erect a mill soon.

Goldfield.—The Goldfield Development Co. expects to start the Consolidated mill early in August. The Red Top mine is ready to supply 1200 tons of ore daily. When the property is in full operating condition, up to 300 men will be employed.

A cross-cut on the 700-ft. level of the Silver Pick has entered the Silver Pick vein in ground sub-leased from the Goldfield Development Co. and a drift has been driven a short distance south-east. The vein is 6 ft. wide and, while regarded as promising, the material in which the drift is being driven is of no value.

A mild boom is in progress in the Cactus silver district. The Cactus Nevada shaft is down 160 ft. in \$46 ore. A winze below this level assays \$35 to \$100 per ton. Buildings have been erected and machinery put in.—A. L. Minter is sinking a shaft nearby in \$100 ore.

Mina.—The Gold Pen mine in the Rand district has been sold to W. W. Wantland of Los Angeles and J. C. Bray of Reno, who have organized the Gold Pen Mines Co., with a capital of \$1,500,000 in \$1 shares. The mine is five miles north-west of the Simen lead mine. About 2000 ft. of work has been done, including a 258-ft. shaft. Since 1907, over \$172,000 in gold has been extracted from high-grade ore.

MAP OF NEVADA

shoots. An electric hoist and compressor, pumps for water-supply, and a 100-ton cyanide mill are to be erected.

Goodsprings.—The Yellow Pine company's new power-plant has been started and hoisting ore is again under way.

Sprucemont.—The Bullshead Mining Co. has purchased a 50-ton smelter and is erecting it at the property in the Spruce Mountain district in Elko county. It is officially stated large bodies of ore averaging 28 oz. silver and 4% lead are blocked out, with an additional 10,000 tons assaying 27 oz. silver and 3% lead.

Tonopah.—The Tonopah Mining Co. during May produced 63,375 oz. of silver and 690 oz. of gold from 4395 tons of ore. The profit was \$29,200.

The Pacific States M. & M. Co. has purchased the Cornforth silver mine at Bellehelen, 50 miles from Tonopah. During the past two years intermittent shipments to smelter realized \$125,000, the ore being worth \$70 per ton. The

cost of mining, transport, and treatment was over \$30 per ton.

Winnemucca.—The Reco Divide company, of Divide, has purchased the Paradise Valley mines at Spring City, in the Santa Rosa range, 50 miles north of Winnemucca. This property was first located in 1878, and after being worked for some time, was closed in 1891. Mining was done mainly by tunnels. The total output of silver and gold is placed at \$3,000,000, of which \$1,000,000 was paid in dividends. Dumps are said to contain 8000 tons of \$16 ore. J. B. Kendall is president, and M. A. Kendall is secretary-treasurer.

OREGON

Medford.—The War Eagle Mining Co. was recently incorporated and taken over by local people, who are: C. M. Kild, president; A. L. Hill, secretary and treasurer; Sam Bertelson and Ed Skewis, directors. The property consists of a group of quicksilver claims on upper Evans creek, 25 miles north of Medford. It has been known for many years that cinnabar existed in a considerable area in this region. Some prospecting was done with variable results until Mr. Bertelson and associates opened a vein that, according to the management, has been tapped with a cross-cut tunnel 75 ft. long, driven east and west 275 ft. and raised to the surface 85 ft., and is now sinking to a depth of 280 ft. The vein averages 5½ ft. in width, and carries 3.5 to 4% mercury. There are two batteries of 12 Johnson and McKey retorts. During 1918, August 1 to January 15, they produced 17,425 lb. of metal. At present one battery of retorts is treating three tons of ore daily, saving a little over 100 lb. of mercury. This is not satisfactory, and a change to other methods of extraction is contemplated.

The Dr. Chisholm group adjoins the War Eagle on the south and the Mountain King mine is still farther south by three miles; these have some good exposures of cinnabar.

UTAH

Alta.—The Greater Consolidated Mining Co. proposes to drive a tunnel from below the Maxfield mine in Big Cottonwood canyon, on up through the canyon into the Alta district, cutting under such properties as the Maxfield, Dolly Varden, the Carbonates, Kennebec, Gypsy Blair, Flagstaff, Emma, Alta Con., Prince of Wales, City Rocks, Black Bess, Woodlawn, and other mines, some of which produced ore in the early days.

According to W. Clegg Butt from England, who recently examined this region, the Big Cottonwoods district has a promising future, provided properties are developed along modern lines. Both surface and deep workings indicate that payable deposits exist. The metalliferous rock that is found on the surface in well-defined strata, though badly broken up in places, and the whole geological aspect of the country, justify the mining man in believing that the old workings, as well as the new, could be made to pay dividends if worked with efficient methods. There are a large number of low-grade galena ore found in this district, would pay well for the working. Of course, there are drawbacks in development of the Cottonwood. One of these is that the strata in places are pretty badly faulted. However, experienced mining men would be able to trace the metalliferous bodies which have been displaced, for by aid of the Zimmerman law, Mr. Butt was enabled to find a lode that had been broken up by a fault.

Tintic.—Ore shipments from this district are totaling around 120 carloads per week. The Tintic Milling Co. last week dispatched 32 tons of bullion, valued at \$90,000 to \$100,000.

The Tintic Drainage Tunnel is in 3000 ft., with daily progress of 10 ft. At present no timbering is necessary. The tunnel will eventually be six miles long, connecting with the

Iron Blossom, Colorado Consolidated, Yankee, May Day, Godiva, and Chief Consolidated.

CANADA

British Columbia

Alice Arm.—The Alice Arm district premises to become an important producer of silver within a few months. The Dolly Varden and Wolf mines, now operated by the Taylor Mining Co., will commence shipping ore at an early date. The Taylor Engineering Co., of Vancouver, has resumed work on the railroad from tidewater to the Dolly Varden mine. At the time of discontinuing work last season the road was completed for a distance of 16 miles from the wharf, to within two miles of the tram. Other properties are being exploited, some showing good veins.

The Alice Arm Commercial Club was recently formed by local people, with H. F. Gordon as secretary, to further development of the district.

The Provincial government has men working on trails. This will place some of the mines that have high-grade ore, but situated farther in the interior, on a shipping basis. The present appropriation for this work is entirely inadequate; however, it is believed that the rapid development shown this season will compel better recognition from the Department and action taken to repair old trails and construct new ones at an early date.

The case of Stewart v. Molybdenum Mining & Reduction Co. has been occupying the attention of the Supreme Court for a week. The plaintiff claims \$35,000 under a bond given to himself and partners for two claims at Alice Arm. It was alleged that after a bond had been given to a party named Riel, the claims were allowed to lapse through failure to do the necessary assessment work, that Riel re-located them in his own name, and transferred them to the Molybdenum company, which spent \$100,000 in development and plant. The case finally was settled out of Court, Stewart and partners receiving one-third and the company two-thirds interest in the mine and plant.

Nelson.—On June 19 the International Mining Convention gathered here, about 200 strong. The delegates on this day organized a branch of the Canadian Mining Institute for the British Columbia interior. S. S. Fowler was elected chairman, and W. G. Wilson, secretary. On the 20th the delegates were welcomed by the mayor, J. A. McDonald. He was followed by the Hon. John Keen, speaker in the Provincial legislature, who was a pioneer of the Slokan district. L. K. Armstrong, secretary of the A. I. M. & M. E. at Spokane, expressed appreciation for the reception given members. L. O. Howard, of the College of Mines at Pullman, Washington, spoke briefly, saying that he was there to learn something. In the afternoon there was a joint meeting of the A. I. M. & M. E. and the C. M. I., Mr. Fowler occupying the chair. Three interesting papers were read, as follows: 'Mining Methods at the Granby Mines, Phoenix', by C. M. Campbell; 'Nodulizing Copper Concentrate', by Oscar Lachmund; and 'Tunneling Reminiscences', by Major Angus W. Davis.

As chairman of the committee appointed to investigate the alleged high smelting charges of the Consolidated M. & S. Co. at Trail, Mr. Fowler said that the conclusion reached had been that the company was justified in the increases enforced at that time. It had been justified in the committee's opinion, because it was shown that the smelter had not been making a profit; what profits were made were coming, not from the smelter but from the mines, the property of the company. T. W. Bingay and J. J. Warren, of this company, briefly covered the points at issue. Nicol Thompson and R. R. Bruce commended the committee's work.

On the 21st, Charles Camisell, of the Dominion Geological Survey, gave a talk on the geologic features of British Co-

lumbian gold deposits. The Hon. William Sloan, Minister of Mines, was present, and talked about capital and labor, establishment of an ore-testing plant, iron and steel production, and mining generally in the Province. 'Revival of Local Treatment as Regards Flotation' was the subject of an address by F. A. Thomson, dean of the College of Mines at Moscow, Idaho. He was followed by T. Hodge, professor of geology in the University of Vancouver, who discussed iron and steel in British Columbia. L. K. Armstrong of Spokane joined in the ensuing discussion. William Tomlinson talked about platinum and other minerals found in ultra-basic rocks, including chromite, molybdenite, and tungsten. J. J. Mulholland, a pioneer prospector, gave a 'straight talk' about the unexplored north-west region of the Province. A 'Summary Review of Mining and the Distribution of Min-

MAP OF BRITISH COLUMBIA

erals in the Kootenays' was the subject of an address by A. G. Langley, district engineer for Mineral Survey District No. 5. A paper on the mineralization of northern Manitoba by R. C. Wallace, of The Pas, Manitoba, was read by Mr. Armstrong, who explained that the address had been placed in his hands for submission to the Convention.

Sheep Creek.—At the Queen mine, a tunnel is being driven to open a vein of free-milling gold ore 30 ft. wide on the 700-ft. level. About \$100,000 is to be spent in development, in charge of A. W. McCune of Salt Lake City. The mine has been opened by an 800-ft. shaft.

Ontario

Cobalt.—The Buffalo Mines company during the year ended April 30, 1919, produced 625,786 oz. of silver, a decrease of 140,000. Sales totaled 803,738 oz. at \$1.01 per ounce. The year's profit was \$171,238. Reserves are valued at \$288,700 net.

The Nipissing during May extracted silver worth \$347,751 from 6829 tons of ore. This is an increase of \$127,824 over the April yield. Vein 99 now shows 60 ft. of ore 5 in. wide, assaying over 5000 oz. per ton. Vein 109 has been opened for 230 ft., of which 130 ft. carries over 5000 oz. across a width of 2 inches.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

J. Parke Channing is at Miami.

Arthur R. Weigall is in London.

G. D. Delprat is at Philadelphia.

J. E. Clennell has gone to London.

L. S. Austin has returned to Salt Lake City.

F. L. Cole sailed from Vancouver for Siberia on the 10th instant.

D. P. Hynes, of the H. L. Hollis company, Chicago, was in San Francisco this week.

John Daniell, of Calumet, Michigan, has been in southern Oregon examining the Alameda Mines Co. and other properties.

Ellsworth Y. Dougherty has been appointed mining geologist in southern Oregon, for the Oregon Bureau of Mines and Geology.

Arthur W. Jenks has returned to New York from Namtu, Burma, where he was smelter manager for the Burma Mines, Limited.

S. Herbert Williams has returned to Ely, as manager for the newly re-organized Boston & Ely Consolidated Mining Co., of New York.

Philip N. Moore is at the Fairmont hotel with the other members of the Minerals Relief Commission, which is now in session in San Francisco.

Ralph Arnold has completed his government service and has resumed his practice as consulting petroleum geologist and engineer with offices in Los Angeles and New York.

George Kislinsky has been examining mines in the old Damascus district, in Placer county, California, and his son, George D. Kislinsky, is examining a mine at Dyke, Nevada.

M. W. von Bernewitz has resigned as Assistant Editor of the 'Mining and Scientific Press' and has gone to New York to collaborate with Walter H. Weed on the 'Mines Handbook'.

William Robertson, smelter superintendent for the Broken Hill Proprietary Co., is visiting various metallurgical plants in the West. He is now at Salt Lake City and will go later to Butte.

Lewis A. Parsons, after six years of service with the International Nickel Company of Canada as Mine Engineer, has resigned in order to accept appointment as Associate Editor of the 'Mining and Scientific Press'.

Harold A. Linke has completed his war-time service with the U. S. Housing Corporation, Department of Labor, in construction of an industrial town for the Mare Island Navy Yard, at Vallejo, California, and has returned to Salt Lake City, where he has opened offices at 416 Boston Bldg.

The U. S. Bureau of Mines makes the following announcements: Roy E. Collom has resigned his position as chief deputy oil and gas supervisor of the State of California, to accept a position with the Bureau as petroleum technologist. His headquarters will be at San Francisco. F. B. Tough, formerly petroleum technologist of the Bureau, with headquarters at San Francisco, who is now in charge of the co-operative work being carried on by the Bureau with the Midwest Refining Co. and the Ohio Oil Co., at Casper, Wyoming, spent several days during June in California. He has returned to Denver, where headquarters will be maintained. Thomas Curtin, formerly expert driller for the Bureau, with headquarters at the Bartlesville station, has resigned to accept a position as general field manager for the International Petroleum Co., with offices at San Antonio, Texas.

THE METAL MARKET

METAL PRICES

San Francisco, July 8

| | |
|--|-------------|
| Aluminum-dust, cents per pound..... | 50-60 |
| Antimony, cents per pound..... | 8.50 |
| Copper, electrolytic, cents per pound..... | 20.00 |
| Lead, pig, cents per pound..... | 5.65-6.65 |
| Platinum, pure, per ounce..... | \$105 |
| Platinum, 10% iridium, per ounce..... | \$115 |
| Quicksilver, per flask of 75 lb..... | \$100 |
| Spelter, cents per pound..... | 8.50 |
| Zinc-dust, cents per pound..... | 10.00-12.50 |

EASTERN METAL MARKET

(By wire from New York)

July 8.—Copper is stronger and higher. Lead is quiet but firm. Spelter is dull though steady.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

| Date | New York cents | London pence | Average week ending Cents | |

Federal Assay-Offices have been instructed by the Director of the Mint to pay market prices hereafter for silver in gold bullion purchased by them. Before July 1 the Government paid \$1 per ounce for such silver. The Government is not in the market for silver at present, but buys all the silver separated in refining gold. The market rate was not paid hitherto, as it was desired to wait until the new fiscal year began. China continues to be a weak factor, and there has been a decline in the rates both at Shanghai and Hongkong. The political situation and the paucity of exports are contributing to the decline in rates. The Indian position is still unsatisfactory, owing to lack of rain and consequent famine.

Tungsten and other producers are becoming anxious over the delay in the decision of the U. S. Railway Administration as to the policy to be pursued in rating these substances. What threatened to develop into a general re-classification of rates in the West was given publicity through a request from the Denver District Freight Traffic Committee for the promulgation of an order apparently affecting only Colorado shippers. The Committee proposed to cancel released values exceeding \$100 per ton, and, in lieu thereof, to increase the rates by 1% per ton of ore, ferro tungsten or blue powder, for every \$100 increase in value, being an increase of \$1 per ton in freight-rate for every increase in value of \$100 per ton or fraction thereof. This ruling would have issued in May but for a lively protest by the American Mining Congress, which held that the precarious condition of the rare-metal industry made further burdens dangerous. A final hearing in Chicago on June 13 was attended by a number of Colorado mining operators, by James F. Callbreath, secretary, and Clifford Thorne, attorney for the Mining Congress. A majority of the members of the Western Freight Traffic Committee and officials of the Railroad Administration heard the arguments made by Mr. Callbreath and Mr. Thorne, the former depicting graphically the destructive results of the order that would close a large number of Colorado mines and de-populate several mining towns. The latter showed that the principle of basing rates upon released value has been voluntarily recognized by the railroads for over a generation, and had been authorized by Act of Congress and approved by the Inter-State Commerce Commission. Both warned against the adoption of such proposed new basic rate throughout the west. During the hearing a number of the Traffic Committeemen expressed themselves as favorable to using the value of the ore at point of origin without adding either transportation or treatment charges, when rates are based on value. They agreed with the shippers that it was wrong to pay freight charged on freight—as is now the practice. That the determination to spread a general order for advanced rates on ores had been agreed upon is now made manifest by a request just filed for increases in rates on base bullion and smelter products from Black Eagle, Anaconda, Basin, Butte, Fuller, Helena, Monarch, Silver, and Wolf Creek, Montana, and Tacoma, Seattle, and Northport, Washington, to Eastern destinations.

Eastern Metal Market

New York, July 2.

The markets are not particularly active because of the turn of the half-year and the approaching holidays incident to July 4. Prices, however, are all strong and some are advancing.

Copper prices continue to increase, but demand and sales are not as heavy as recently.

The tin market is disappointingly quiet, although most of the restrictions have been removed.

Demand for lead is moderate, but prices are strong and some expect an advance.

Zinc prices are firm and tending to advance, but demand and sales have fallen off.

Antimony is unchanged.

IRON AND STEEL

The turn in the steel industry is revealed as definite by the June pig-iron output. The rate per day was 70,495 tons, or 2,114,863 tons for the month, as against 68,002 tons per day or 2,108,056 tons in May, according to 'The Iron Age'. This gain in output was the first check to a steady decline in the daily average from the high point reached in September 1918, at 113,942 tons. There was a gain of five furnaces in the month, 17 blowing in and 12 blowing out. It is estimated by Pittsburgh producers that new orders for rolling in June and June specifications against contracts were 50% heavier than in May, while in wire and tubular products they were nearly double. A labor shortage is threatened in many sections, and this may interfere with fuller operation expected in the fall. June was the best month in the sheet trade since last October.

COPPER

The market continues to develop unusual strength. Prices have advanced almost each day during the last week, although the demand has not been large enough to develop into heavy sales. This is not so much due to lack of interest on the part of consumers as to the disinclination of producers to sell far ahead. It seems not at all improbable now that Judge Gary's prediction that copper would sell at 20c. in the near future, would be verified within a few weeks, perhaps before the end of July, although at that time his optimistic expectations were not shared by the majority of the large copper interests. Already electrolytic copper is quoted and selling today at 19c., New York, July delivery, with some sellers insisting that it can't be bought under 19.25c., while for August delivery 19.25 to 19.50c. is asked and obtained. Lake copper is $\frac{1}{2}$ to $\frac{1}{4}$ c. above these levels. While inquiry has developed for delivery as far ahead as the first quarter there is little selling beyond August, producers generally being sure of a higher market as time goes on and disinclined to commit themselves for the future beyond necessity. Japan continues a buyer, and some other foreign business has developed, but nothing definite has been made known yet as to the needs or intentions of the Germanic countries.

TIN

The market is narrow, restricted, and somewhat disappointing. It is probable that there will be but little trading until normal supplies are the rule as a result of importations and large stocks. Import licenses are being granted for Straits tin for July-August shipment at 50.75c. and for English tin at 50.25c. For Straits tin from England 51.50c. is quoted for shipments as soon as restrictions will

permit, this not being metal from point of origin. It is pointed out that in August, besides American tin which is now about 68c., New York, there will also be on the market English tin as well as stocks of Straits metal. The general market the last week has been quiet and the total of transactions has been small. Some consumers low in Straits tin have been endeavoring to purchase metal as stocks in the hands of other consumers or what has been known as the 'allocated' tin and some sales have been made at 70 to 70.50c., New York, for spot delivery. On the whole, buying as a result of the lesser restrictions has been less than expected, but interesting developments are looked for when the market broadens and conditions approach normal.

LEAD

A quiet tone generally prevails, but prices are firm at 5.40c., New York, or 5.15c., St. Louis, the quotation of the American Smelting & Refining Co. There are those who state that as high as 5.45c. has been done, but it is believed by some that this applies to only limited amounts. The fact that the leading interest is understood to be taking no business at all now is said to indicate an advance soon. Demand is not heavy.

ZINC

There has been a lull in the buying of zinc from all sources, but prices show no sign of weakening; on the contrary, they are higher and prime Western for early July delivery today is quoted at 7.10c., St. Louis, or 6.45c., New York, with five points higher for August and September. As in copper, however, sellers are not eager to sell beyond early months and the tone of the market is strong and confident as to the future of prices. Ore prices are also firm and high, which reacts, of course, on zinc. Japan is still a buyer and other export business is good.

ANTIMONY

There is no change and the market is quiet at 8.37 $\frac{1}{2}$ to 8.62 $\frac{1}{2}$ c., duty paid, for wholesale lots for early delivery.

ALUMINUM

No. 1 virgin metal, 98 to 99% pure, continues unchanged at 33c., New York, duty paid, for wholesale lots for early delivery.

ORES

Manganese: Imports in May were 19,644 gross tons as compared with 29,837 tons in May 1918. The total for the 11 months ended May 31 this year was 440,902 tons as compared with 519,591 tons for the same period in 1918.

Manganese-Iron Alloys: About 6000 tons of American ferro-manganese was sold a week ago in the scramble to take orders at the lower price of \$110, delivered. There are now no inquiries before the market and domestic producers are asking \$125, delivered. British prices are again lower at \$115, seaboard. Spiegeleisen is quoted at \$30 to \$35, furnace.

Molybdenum: The market is very quiet and prices are nominal at last week's levels of 75 to 85c. per pound of MoS₃ in 90% concentrate.

Tungsten: One seller reports considerable activity during the week. Inquiries for high-grade ore are now numerous and frequent. Prices are nominal at \$7 to \$10 per unit in 60% concentrate. No reported reliable list of the ferro-tungsten market has been brought to light. In Great Britain the low-carbon alloy, 75 to 80% tungsten, is quoted at 3s. per pound, with the metal 96 to 98% at 3s.6d. per pound.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

A GIANT CRUSHER

What is probably the largest gyratory crusher in existence was recently built by the Traylor Engineering & Manufacturing Co. at Allentown, Pennsylvania, for a large company in Michigan.

The giant, which is of the Traylor 'Bulldog' type, has two receiving openings, each 5 by 15 by 10 in., and a capacity of 2500 tons per hour. Some idea of the size of this crusher may be gained from the fact that the shafting alone weighs over 62 tons. The accompanying illustration, showing a man standing beside this shafting, affords a striking comparison. The total weight of the crusher, exclusive of driving pulley, delivery chutes, and foundation, is more than 237 tons.

The development of gyratory-crushers does not show as rapid progress as does that of other mining machinery. The first gyratory was built about 40 years ago. It had receiving openings of 7 by 28 in. and a capacity of 10 tons per hour. Many years passed before capacities had advanced to 50 tons; and another decade elapsed before a 200-ton gyratory was finally built. It is a far cry from that comparatively small capacity to the 2500 tons per hour of the new 60-in. 'Bulldog'.

Credit for the design of this crusher goes to Richard Bernhard and L. J. Hewes, of the Traylor company. Both men have been identified with the development of gyratories since their inception, Mr. Hewes having helped construct the original crusher mentioned, while Mr. Bernhard designed and built the first 200-ton machine.

The Traylor company manufactures a complete line of crushing equipment including rolls and jaw-crushers, for practically any required capacity. Notice the 'baby' gyratory set upon the pulley of the giant 'Bulldog' in the accompanying illustration.

A NEW FASTENER FOR BELTS

A remarkable new fastener, designed for heavy belting and made in sizes for belts varying from $\frac{3}{8}$ in. upward in thickness, is being manufactured by the Flexible Steel Lacing Co. of Chicago. The term given to it is the 'High Duty' fastener.

This appliance embodies a new application of the compression principle as applied to belt fasteners. It consists of two rectangular steel plates, which clamp on either side of the belt and are connected by bolts that go through the belt. The top plate has two round holes, which are counter-

Shaft and Head of Crusher—21 ft. Long, 6 $\frac{3}{4}$ ft. Diameter, 65 Tons

sunk to hold the special cone-shaped nuts; while the bottom plate has two special square seats which fit around the square heads of the bolts.

The tendency toward increasing thickness in conveyor-belts has demanded a new type of joint, as no satisfactory heavy fastener was available. The high duty joint is simple to apply; it takes only a reasonable time in proportion to the size of the belt. The strength of the joint makes its

modest cost a desirable insurance on the life of the belt. The sizes of the high duty fasteners are proportioned to the thickness of the belt for which they are designed. The illustration shown herewith is from a photograph of the fastener, and shows the construction of the upper and lower plates, as well as the special bolt and nut.

The Flexible Steel Lacing Co. is also the maker of the well-known and popular 'Alligator' belt lacing, Flexco lamp guard, Flexco-Lok lamp-guard, and the Split-Handle portable lamp-guard.

WATER-WHEEL ATTACHED TO CONICAL MILL

The accompanying pictures show the installation of a Hardinge mill and Dorr classifier at the Empresa Minera Parcoy, Parcoy, Peru, South America. The manager of this plant—Mr. Tarnawiecki—has shown considerable ingenuity in getting around a difficult matter. Apparently there must have been considerable trouble with leather belts, and, as water is much cheaper than leather, he attached some buckets to the pulley on the Hardinge mill, thus converting it into a water-wheel. These buckets were made of steel sleepers taken from a narrow-gauge

railroad track. This plant has been in successful operation for some time.

The Smith-Booth-Usher Co. of Los Angeles has opened offices in the Rialto Bdg., San Francisco. H. A. Olds and J. A. Kinhead will be in charge of the San Francisco house. It is the intention of the company to give a larger and more complete service along the line of contractors', mining, and oilfield equipment.

'WAFER' VALVES FOR COMPRESSORS

Sullivan single stage belt-driven compressors, type WG-6, and the corresponding steam-driven type, WA-6, are now being supplied with the new improved plate valves, developed by the company's engineers at Claremont, New Hampshire works. This valve, known as the Sullivan 'Wafer' valve, is shown in the accompanying illustration. The small

Sullivan 'Wafer' Discharge Valve

size, light weight, and compactness of the valve, also its spring and seat are illustrated.

The 'Wafer' valves seat in cages arranged radially to the axis of the cylinder and close to the two ends of the cylinder, the inlet valve being situated at the bottom and the discharge valve at the top. These valves are held to their seats by flat annular springs of the same material as the valve themselves, which is the finest tempered spring steel obtainable. The valves open against specially designed guard-

plates, intended to give a wide port-opening with a minimum of clearance-volume, and without restricting the admission or charge of the air to or from the cylinder. The valve, spring, and guard are easily accessible by the removal of a screw-plug.

The simple and short construction of the springs permits the valves to be placed closer to the bore of the cylinder than is generally permissible with valves of this type, with a corresponding reduction in clearance losses. The light weight of the valves and the superior quality of the material give long life. The question of repair stock is simplified because the same valves, springs, and guards are used for both inlet and discharge.

The valves are employed in multiples of relatively small size, in place of one or two valves of large diameter, the objection to the large valves being the large clearance-pockets required and the likelihood of more noisy action and greater breakage.

Machinery that heretofore has been used almost entirely for the recovery of minerals from their ores is now being applied by the National Smelting Corporation of San Francisco to the reclamation of the metallic contents of various industrial refuse. Floor-sweepings, tumbler-barrel mud, emery grindings, broken crucibles, skimmings, oxidized metals, sawings, and other metallic residues, are now being successfully reclaimed at this company's plant. The equipment in present use includes classifiers, jigs, and a Deister-Overstrom sand-table.

WE have ascertained that, although the League of Nations is the all-absorbing subject of political discussion, not many of our friends have actually read the text of the Covenant; therefore we print the full text of the revised form of the Covenant in this issue, hoping that our readers will find it useful in following the forthcoming debate in Congress and in the daily press.

TRAVEL by aeroplane has been brought within the domain of real life by the successful flight, to and fro across the Atlantic, of the British dirigible balloon, the R 34. It is just ten years since Bleriot flew across the English Channel and thereby proved man's conquest of the air. This latest achievement of Captain Scott and his crew is far the most significant event since the feat of the French aviator in 1909.

UNDER 'Discussion' we print a letter from Mr. E. M. Hamilton criticizing our effort to discriminate between 'recovery' and 'extraction'. We are glad to publish this letter because Mr. Hamilton himself is a careful, and therefore effective, writer. It is far less important that any two or three of us should agree in the use we make of technical terms than that we should use them intelligently and thoughtfully. We appreciate the fact that his argument has some validity, even if it fails to be conclusive. The distinction between the two terms under discussion is made more easily when describing a concentrating process than when describing leaching operations, yet even in the latter case it can, we think, be maintained usefully, as illustrated in the foot-note we append to Mr. Hamilton's letter. The introduction of 'abstract' into the context is inadvisable because that word is already burdened with other significations.

DANGEROUS, it seems to us, is the plan to place the Kaiser on trial in London. Not that he should go unpunished, but the kings of England and of Belgium are his cousins, and kingship reduced to felony will scarce survive another regicide. Justice calls the Kaiser to an accounting—he and his dishonored sons. We would also like to see Von Tirpitz and others responsible for piracy brought to the bar. Shall we make a martyr of William of Hohenzollern or let him live in dreary exile? He is no longer dangerous; his part in the War was too unheroic; let us put him and his consort in a hut in Iceland to end their days there forgotten. Whatever is done must be done not in a revengeful spirit but justly and as

a deterrent for other ambitious men in the days to be, so "that neither schools nor priests, nor kings may build again a people with the heart of beasts made wise concerning men; whereby our dead shall sleep in honor, unbetrayed, and we in faith and honor keep that peace for which they paid."

REVERBERATORY smelting practice, as against the use of the blast-furnace, is the subject of an interesting contribution to our 'Discussion' columns by Mr. Walter G. Perkins, whose experience includes British Columbia, Nevada, and Siberia, among the many countries in which he has done professional work. His letter is a sequel to a recent article on the subject by Mr. O. E. Jager, who speaks from observation at Anaconda. Mr. Perkins has expressed definite conclusions and he has based them upon smelting operations on a large scale, so that we hope his opinions so frankly stated will be the means of eliciting further valuable information.

THE House of Representatives declined to over-ride the President's veto on the repeal of the Daylight Saving Act and we are glad of it, for not only is the saving of daylight a useful regulation, but the method of attempting to end it is thoroughly vicious, namely, by tacking the repeal in the form of a rider to an important appropriation bill and 'thereby preventing a vote on the merits of the measure. This was done by the Senate; it is a device used by legislators in order to pass laws that they do not wish debated or put to the vote; it is a bad trick and thoroughly opposed to the first principles of representative government. We are heartily in support of the President's veto of the Agricultural Appropriation bill, which should be separated from its rider, the repeal of the Daylight Saving Act, a law much too important to be so lightly treated. The two legislative measures have nothing to do with each other and should be considered separately on their respective merits. We were among those adverse to the moving backward of the clock in 1918, but the experience of the past year has amply demonstrated the utility of the artifice and we hope to see it perpetuated.

ST. JOHN DEL REY is the deepest gold mine, and also the deepest metal mine, in the world; therefore its annual report is of general interest to the profession. The latest report is the 88th, for the St. John del Rey Mining Company was organized in 1834. The enterprise is British, but the mine is in the State of Minas Geraes.

in Brazil. Last year the output of gold was worth £423,029, or about \$2,000,000 in American money. The average yield from 165,000 tons was \$13.27. The profit was \$590,244, which was \$90,000 less than in 1917, the decrease being due chiefly to the adverse conditions created by the War. A dividend of 10% was paid for the year 1918. The workings have reached a vertical depth of 6326 feet. At the bottom the temperature is 116°F. when the ground is first penetrated, and even the mean temperature of the air underground during the summer is close to 100°, so that particular pains has to be taken to ventilate the mine with a view to rendering working conditions tolerable. The natural increase of temperature is one degree per 126 feet of descent. A large Sirocco fan is used and it is proposed to supplement this with an air-cooling plant. The deeper portion of the mine, below 1940 ft., has been opened up in a most unusual way, by means of a steplike system of winzes and levels, each winze being 1200 feet long and connected with four levels at intervals of 300 feet, so that, as a Cornishman would say, "the h'ore is pulled out by the 'air of the 'ead." The scheme of development depends upon the fact that the workings follow not the dip of the lode but the pitch of the orebody, which stands at an angle of 40°. It is pleasing to note that the size of the orebody and the quality of the ore have shown improvement on the lowest 'horizons', as they are called, although the showing is not so good as it was in the younger days of the mine, the dimensions of the orebody at 5800 feet being about 15 feet by 1000 feet, as against a width of 45 feet and a length of 600 feet in the upper workings. The reserve of ore amounts to 1,209,104 tons. The management is conservative. Mr. George Chalmers has been manager during the life of the mine, and his son, Mr. A. G. W. Chalmers, has recently been appointed assistant manager. We take the opportunity of congratulating the father and of wishing success to the son. Most men outlive most mines; it should cheer the miner to hear about a mine that seems likely to last the time of two generations.

The War Minerals Relief Scandal

From a telegram sent by the Secretary of the American Mining Congress to one of our local newspapers we learn that the Attorney-General at Washington has ruled that, under the War Minerals Relief Act, "no claims based upon general appeal or solicitation will be considered, and claimants must have been asked specifically by one of the five Government agencies named in the Bill." We regret greatly that the Attorney-General should have made such a ruling and that the Secretary of the Interior should have 'passed the buck' by asking him for an interpretation, because the consequence will be nothing short of a breach of good faith. Let us suppose that a miner or mine-operator was approached by one of the young engineers on the staff of our friend Mr. Albert Burch here in San Francisco when he was acting for the U. S. Bureau of Mines in the effort to stimulate

the production of the minerals needed by the Government in the waging of war, and let us suppose that in consequence of such personal solicitation this miner or operator, whom we will name A, was induced to engage in the mining of chrome, manganese, tungsten, or pyrite in California. Next, let us imagine the equally likely contingency of B, another miner or mine-operator, seeing one of the circulars of the Bureau of Mines, in a newspaper, urging upon good citizens of our mining districts to engage intensively in the production of the needed minerals, or, to be more specific, let us suppose C, a mining engineer, finding in the 'Mining and Scientific Press' of March 9, 1918, an editorial paragraph stating that Mr. Franklin K. Lane, the Secretary of the Interior, had issued a circular entitled 'How to Save Ships' in which this member of the President's cabinet urged "the energetic exploration and intensive development of certain needed mineral resources," the idea being that if these minerals were produced in the United States it would be possible to release ships then engaged in the foreign mineral trade and use them in the transportation of soldiers and supplies to France during the most critical period of the War. Mr. C, it may be taken for granted, believed what the Editor had written and believed that Mr. Lane was authorized to speak for the Government; to him the message urging the production of chrome or manganese was just as authentic whether it came verbally from a junior member of the staff of the U. S. Bureau of Mines or whether it came in print through a reputable publication; indeed we can imagine Mr. C already starting to work when Mr. A told him about the 'hurry-up call' for war minerals and Mr. C telling Mr. A that he knew all about it already, having read the message of Secretary Lane in the 'Mining and Scientific Press.' Congress has passed a bill to compensate those who went to work to produce the needed minerals in response to the Government's call, that is, to compensate them for loss caused by the collapse of the market as soon as peace became imminent, but the Attorney-General rules that A is entitled to compensation, but B and C are not. Is this just or reasonable? We think not, and we regret what seems to us a great blunder; for the unfairness, if not stupidity, of the distinction established by the Attorney-General smacks of sharp practice. Of course, it is well and honorably meant, but the effect of it will be to besmirch the good name of the Government—not the administration of President Wilson alone, but the Government of the United States, which is more important. What are two or three million dollars compared with the honor of the Government? At any time, but particularly in these days, when we are trying "to make the world safe for democracy," it is of the utmost importance that every form of representative authority—of the City, of the State, of the Federal Government—should set an example not only in honesty, but in honor, in maintaining a code of conduct that shall be emulated by the citizens in their dealings with one another. If those high in authority, if the highest authority of all, the Federal Government, plays fast and loose or side-

steps its obligations, it is a moral calamity no less lamentable than the physical loss of a battleship or the surrender of a battalion in battle. Moreover, this is a poor return for all the publicity cheerfully and gratuitously given by the press of the country to the Government's admonitions and messages during the period of the War. It was wholly impracticable for the officials at the head of the various Federal departments to reach every citizen by letter or circular, therefore it became the practice to send notices to the editors, asking them to draw the attention of their readers to the various calls made by the Government on the people. Newspaper publicity was an essential factor in selling Liberty bonds and in making known the President's endorsement of the campaign for Red Cross funds, and similar propaganda. The press became to the Nation what the town crier was to the village community. Having sent a circular to the editors of the technical press asking them to urge the production of sundry minerals, does the Secretary of the Interior go back upon his responsibility for the ensuing production merely because the appeal was not made personally by him or by one of his employees? We note with pleasure that the American Mining Congress is to take the matter in hand and intends to importune Congress to correct the injustice threatened against the very men whom the War Minerals Relief Act was intended to compensate for performing a service of national importance during the critical period of the War.

The Discovery of Froth-Flotation

On another page we publish a letter from the firm of Sulman & Picard, metallurgists to the Minerals Separation company and sponsors of several of the more important patents on flotation. They enter a not unreasonable protest against sundry remarks of ours on the Wolf patent appearing in our issue of March 22. First we are chided for discussing a matter that is still *sub judice*; and we enter a plea of guilty to this infraction of what we are told is British custom. If we had waited until the controversial features of the flotation process had ceased to be *sub judice* we would have been silent for many years past, and that is a contingency we hate to contemplate, however well it might have suited the friends of Minerals Separation. Even now the subject remains *sub judice*, for the Butte & Superior case is in the hands of the District Court of Montana and the Miami case is still before the Third Circuit Court of Appeals at Philadelphia. However, we shall not upbraid Mr. H. Livingstone Sulman or Mr. Hugh F. K. Picard for discussing matters still *sub judice* in the United States, because in this country the public ventilation of such matters is not deemed improper. Our correspondents send us the transcript of the judgment in the Sulman & Picard v. Wolf case as pronounced by Mr. Justice Buckley in 1905, but they say that they hardly expect us to reproduce it in full. Our readers will find these gentlemen to have been too modest in their expectations, for we take pleasure in reproducing the judgment verbatim, re-

alizing the difficulty of giving the gist of it satisfactorily. We might make some further remarks on the Wolf case, but we deem it fairer to let Messrs. Sulman & Picard have the last word as far as we are concerned. Mr. Wolf may feel inclined to reply. We believe that he is still in New York, where we discussed the subject with him in February. It is not necessary to respond to the further strictures from the gentlemen in London. Our reputation for "technical knowledge and business rectitude" calls for no defence at this time. There may be room, it is true, for disagreement as to the rightness of the policy we have adopted in combatting the exactions and inquisitions of the Minerals Separation people. Our attitude has been based upon the conviction that whereas Messrs. Ballot, Sulman, and Picard have contributed largely to the development of the flotation process, they share that honor with many others, for we believe that their supposed discovery of the basic principle was the result of haphazard practice in the Central mill at Broken Hill in 1903 and 1904, not upon the discovery claimed to have been made in the Minerals Separation laboratory in London in 1905. We refer the reader, again, to the paper by Mr. James Hebbard in the Proceedings of the Australasian Institute of Mining Engineers, read by him on November 10, 1913, in which the origin of froth-flotation is, it seems to us, clearly intimated. Mr. Hebbard says: "In the course of ordinary operations, it had long been observed that a froth was formed containing high metallic values, in silver and lead particularly, whenever conditions were favorable, as, for instance, where the rotation of trommels, or the splash of the elevators or raff-wheels, or the motion of the jig-plungers, produced a violent agitation of the mill-water containing slime. Early in 1901 a series of experiments was carried out for the purpose of reproducing and accentuating the conditions responsible for this valuable float-concentrate. Experiments and tests extending over several months, were made on slimes of varying degrees of fineness. . . . It was thus early recognized that the bubbles of froth noticed in the wet-concentration operations were due to the aeration produced by violent agitation, resulting from mechanical implements moving rapidly in water. In these experiments a metallic froth or scum could be produced and recovered assaying 26 oz. silver, 30% lead, and 22% zinc." In December 1904, says Mr. Hebbard, further tests in the Central mill, using only 0.75% of oil, gave results that were "excellent, with all float-concentrate, no granular material being formed." We are informed, at first hand, that as early as 1902 Messrs. W. Shellshear and F. A. Beauchamp suggested the application of the idea, of floating the metallic sulphides over a spitzkasten after agitation, in order to correct the failure of the granulating, or Cattermole, process, and that the suggestion was put to the test in 1903. It was ascertained that the flotative effect was produced while using 9 pounds of oil and 22 pounds of acid per ton of ore. Later the proportion of oil was diminished gradually to 2 pounds per ton. This, we infer, was the real beginning of the froth-flotation proc-

ess as patented by Messrs. Sulman, Picard, and Ballot in the United States on May 29, 1905. It remains to note that the experimental work done in the Central mill was known to the Minerals Separation company. We have made these statements before, and they have not been contradicted. On them we base our justification for combatting the efforts of Minerals Separation to secure a monopoly on flotation and to impose their inquisitorial and domineering methods on the metallurgical profession in the United States. We do not deny the inventor's right to a reward from the community, we merely question the assertion that the patentees of 835,120 were the discoverers of the process described in that patent; we believe them to have been developers of the flotation idea, and we concede cheerfully that they have contributed largely to the growth of its metallurgic usefulness, but we believe also that mill-men in this and other countries have contributed to the successful result, some of them in a small way, to be sure, but with an aggregate effect not to be underestimated. For this reason we think it unfair to these and to other inventors to give Minerals Separation the exclusive rights to the process in the United States.

The Miami Case

With reference to the litigation over the flotation patents, more particularly No. 835,120, we think it well to remind our readers that the case of Minerals Separation v. Miami Copper Company is yet *sub judice*. It will be recalled that this case was decided adversely to the Miami company on a strict interpretation of the patent in so far as it controls the type of agitation, because, unfortunately, the Miami company used both a Pachuca agitator and a centrifugal pump in its experimental work and milling operations prior to October 1915, the period covered by the record in the case; but since then the company has used neither of these methods of agitation, depending entirely upon the Callow type of pneumatic machine for the aeration necessary to the formation of an effective froth. At the present time a Master appointed by the lower court, namely, the District Court of Delaware, is hearing evidence on the accounting precedent to an award for such damages as will be levied upon the treatment of the small tonnage of ore covered by the opinion of the Third Circuit Court of Appeals, as promulgated on May 25, 1917. An important feature of the Master's report will be his opinion, after review by the Court, as to whether or not the later milling operations, subsequent to abandonment of the two agitating machines, come under the ban of the Court of Appeals. The point we make is that the pneumatic method of agitation has not come under the ban of infringement. It will be recalled that the decision of the appellate court was divided, two judges upholding the patent, whereas the third dissented. Judge Woolley, in recording the majority opinion, held that "the invention resides not alone in the critical proportion of oil, but also in air and agitation," or, as he expressed himself elsewhere in the

decision, "in the co-action of the critical proportion of oil and air effected by 'an agitation greater than and different from that which had been resorted to before', resulting in a froth-concentrate of economical [meaning economic] value." The words quoted by the Judge are taken from the U. S. Supreme Court's decision in the Hyde case, of course. In the recent opinion of the Supreme Court, in the Butte & Superior case, it is held that the "patent is on the process; it is not and cannot be on the result." Judge Buffington, who dissented from the majority opinion of the Third Circuit Court of Appeals in the Miami case, held that the invention was not based only on the use of a minimum proportion of oil and concluded that "the step of the process 'agitating the mixture until the oil-coated mineral matter forms into a froth', meant the novel *air-entraining* agitation which the patentees disclosed, and did not cover the novel *air-releasing* agitation which the defendants disclosed." It is more than likely that the Miami case will be carried to the Supreme Court, in which event there will be presented a record much stronger than either in the Hyde or in the Butte & Superior case. An entirely different phase of the dispute will be submitted. The opinions given in the Butte & Superior case are so different from those delivered in the Miami case as to arouse a feeling of bewilderment in the minds even of engineers familiar with the various litigations. In the one case the crux was the interpretation of the "critical" proportion of oil, that is, as to what fraction of 1% was covered by the patent; in the other case the question was, and still is, as to whether the pneumatic method comes within the scope of the patent. The Ninth Circuit Court of San Francisco in the Butte & Superior case centred its attention on the proportion of oil used in the process; the Third Circuit Court of Philadelphia in the Miami case kept its eye on the character of the agitation employed; each of these appellate courts interpreting the particular part of the Supreme Court's decision in the Hyde case that referred to one phase of the dispute, neglecting other controversial points. In doing so, of course, the lower courts passed judgment only on the points raised in the briefs and arguments of opposing counsel; and the highest court, in turn, adjudicated the issues presented to it from the court below. It is noteworthy how little information is given, in any of the records of these cases, as to the early application of the flotation idea in Australia, particularly the froth-agitation method, which was developed from observation and experiment in the Central mill, at Broken Hill; on the other hand, there is repeated reference to the litigation between Minerals Separation and the Elmore brothers in the English and Australian courts, although the issue in those cases concerned only the old bulk-oil, not the vacuum-air, process of the Elmores, and therefore bore no relation to the froth-agitation process of Minerals Separation. It is evident that it is high time for taking such disputes over patents from the ordinary courts of law and placing them under the jurisdiction of a technical court specially equipped for such investigation and adjudication.

DISCUSSION

Flotation Litigation

The Editor:

Sir—We have read the editorial in your issue of March 22 entitled 'Flotation Litigation', which we have not commented on earlier as we prefer to follow the usual British practice of refraining from discussing in the press a matter which is still *sub judice*. Now that the case referred to is settled by the Supreme Court of the United States we wish to call the attention of your readers to some facts in regard to our action against Mr. Wolf to which you refer in your article. We can only assume that you did not take the trouble to ascertain the real bearing of this action or that your remarks were based upon an *ex parte* statement.

So that you may be placed in full knowledge of the particulars we enclose herewith transcript of the Judgment of Mr. Justice Buckley in the case. It would be too much to expect you to reproduce the judgment in full, though in justice to ourselves we think you should do so, but if you will be good enough to read it you will no doubt take the opportunity of correcting your statements in an early issue. You will see from the judgment that Messrs. Minerals Separation, Ltd. were not parties to the action directly or indirectly and consequently your statement that "Mr. Wolf, like the Elmores, had an unpleasant experience with Minerals Separation" is incorrect. You will also see that we took action against Mr. Wolf for the recovery of fees for services rendered, and that before accepting an engagement from him we informed him that we had an interest other than that of professional advisors, in a company owning a process which was likely to prove a serious competitor. In the action Mr. Wolf saw fit to counter-claim against us on the grounds that we had (as he alleged) taken out patents in respect of discoveries made whilst in his employ, though he never made any complaint on this or any other pretext till the writ was issued. The judgment makes it clear that this claim was quite untenable on the grounds that there was no similarity either in principle or in detail between the process patented by ourselves and that of Mr. Wolf. In the result judgment was given in our favor for the amount of the claim, whilst the counter-claim was dismissed with costs, the Judge not even calling upon our counsel to reply.

The statement in your article that the judgment held that Sulman & Picard had fulfilled every obligation of their contract is true so far as it goes, but like many statements it only contains a portion of the truth, and is

misleading in that the most important points of the judgment are entirely omitted.

We notice that you have in the same issue quoted the Wolf patent in full and that you are recommending or suggesting to users of flotation processes that this might form a foundation for further action against Minerals Separation, whereby they might be successfully robbed of the fruits of their work. We consider it fortunate for the industry that you have quoted this patent in full as no one who has the least technical knowledge of flotation would recognize in Mr. Wolf's patent a process which in any way can be said to anticipate the froth-flotation process as patented by Minerals Separation, and we are surprised that a paper which professes technical knowledge and business rectitude should recommend its readers to adopt such a course.

We know that you lay claim to impartiality, though we regret that in the many attacks which have been made upon us and Minerals Separation in your journal we have not seen evidence of this. With, however, the judgment before you you will have an opportunity not only of displaying this quality but of rectifying the misstatements contained in your article of March 22.

In this matter we have no quarrel with Mr. Wolf, though if your article were inspired by information received from him, his recollection of the events is clearly at fault.

Should Mr. Wolf be advised that the Minerals Separation processes are an infringement of his patent—a view which you evidently hold—we have no doubt that Minerals Separation will be quite prepared to defend themselves against any action which he may wish to take.

SULMAN & PICARD.

London, June 13.

Exit the Blast-Furnace

The Editor:

Sir—Mr. O. E. Jager's article, in your issue of the 21st ult., is a clear broad statement of the trend of current practice in the smelting of copper-sulphide ore and concentrate; as it is backed by the prestige of being the latest expression of Anaconda technology, it is of especial interest to metallurgists.

There is one point that he has not clearly expressed in terms of its real value and importance. In the recapitulation of the merits of the two types of furnaces, the blast-furnace item, "higher cost of power", is not sufficiently defined. Power for tramping the charge, calcine, and slag will be approximately the same in both

cases, therefore the difference represents the cost of compressed air.

The fuel (potential energy) in a blast-furnace is valueless without the compressed air that supplies the oxygen, to promote kinetic energy. This item therefore automatically becomes a money charge with, or on, the fuel when comparing the cost of the fuel consumed in the two types of furnaces. The air for burning the fuel in the reverberatory, being at atmospheric pressure, has no cost against it. This fact is not generally recognized, but nevertheless it indicates the only way of making a true comparison of fuel-cost.

It would be interesting and instructive if Mr. Jager could give detailed figures in terms of heat-units, for instance:

Reverberatory Furnace: Heat-units (fuel) per ton of calcine (at $x^{\circ}\text{C}.$) smelted.

Blast-Furnace: (1) Heat-units (fuel) per ton of ore or charge smelted. (2) Heat-units (air) per ton of ore or charge smelted, for producing compressed air.

This would put the factor of extraneous applied heat on a basis parallel with kinetic energy, as against cost figures showing fuel in terms of potential energy only.

Mr. Jager has made his comparison between roaster *plus* reverberatory versus blast-furnace, therefore, the heat balances of chemical reactions will, broadly speaking, cancel one another and the question of reducing only the fuel in the different types of furnaces to segregated relative and comparative terms becomes important.

The reason that I emphasize this particular point is that I go further than Mr. Jager and believe that even in pyritic smelting, using only $1\frac{1}{2}$ to 2% coke to the charge, the apparent saving by smelting this type of ore in blast-furnaces is anything but real, if the cost of air for the production of kinetic energy is stated in terms of the extraneous fuel used. For purposes of comparison, the reverberatory furnace must be given an equivalent direct heat-unit credit for smelting calcine. The heat-balances from the chemical reactions of the material being treated will be the same in both cases, even though the mechanical means of obtaining them are very different. The problem, then, comes down to whether it is better, technically and financially, to use a certain amount of money in terms of heat-units, for compressing air for blast-furnace smelting, or to use the equivalent sum, more or less, for direct heat-units applied as fuel for smelting hot calcine in a reverberatory furnace.

If the run-of-mine ore from a pyritic deposit be taken as an instance, 15% must be screened out as fine, another 10 to 15% will be blown out of the furnace and recovered as flue-dust, therefore 25 to 30% of the total ore must under any circumstances be treated in roasting and reverberatory furnaces, or go through some process that will render it physically suitable to become part of the blast-furnace charge. The smelting of these products is a cost on the blast-furnace, which is thus seen to be a defective machine for smelting, when compared with roaster and reverberatory, which will smelt not only the material the blast-furnace cannot handle, but also that

which it can, namely, the coarse ore. It is not sufficiently recognized that even coarse ore decrepitates, and becomes fine, just as soon as it comes in contact with heat, when the sulphide portion is in sufficient proportion to cause it to be classified as pyritic ore (about 90% iron sulphide, FeS_2). The statement regarding decrepitation does not apply in the same exaggerated degree to pyrrhotite or to those ores in which the percentage of complex silicate gangue ranges from 20 to 30% or more. This type of ore, however, has passed out of the domain of pyritic smelting, becoming semi-pyritic, and the problem of smelting it becomes even worse for the blast-furnace, because the fines and flue-dust problems still remain in varying degrees. One of two courses for smelting such material in a blast-furnace has to be followed; either the entire tonnage must be roasted in heaps, with its attendant costs of handling and re-handling, its roast-yard waste, and leaching losses, or it must be smelted, or melted, in a blast-furnace at a high cost for coke, plus air, to separate the gangue from the mineral, throwing the load of 'raising' the low-grade matte to a marketable form on the converters. Following this procedure there is a second extra charge for compressed air necessary by virtue of the large volume of low-grade matte produced; only this time instead of the 40 oz. of air already used in the blast-furnace, mostly for burning the fuel, 10 to 12 lb. air has got to be compressed for bessemerizing.

There are local conditions that change the financial aspect of smelting a given ore in any particular locality, but even then there are few cases where blast-furnace smelting can justify its existence, when compared with modern roasting and reverberatory practice for any sulphide material that comes under the classification of direct smelting. The question then resolves itself to whether the reverberatory is a fully developed machine as at present used. I do not think it is, and it will not even start on the way to perfection until the waste-heat boiler is scrapped along with the blast-furnace, and the logical method is adopted of using the waste heat in properly designed regenerators, which will return the heat-units directly to the furnace itself in live air.

In the non-reversible regenerative furnace built at Kyshtim, Russia, and described in an article in the 'Mining and Scientific Press' of June 2, 1917, the following furnace temperatures are shown:

At bridge-wall $2732^{\circ}\text{F}.$

At throat 2372° , a drop of 360° in 90 to 100 ft. of length.

At stack 450° .

Hot live air to furnace from regenerator at 900° .

This furnace is 16 ft. wide by 90 or 100 ft. long, the fuel used is gas of low calorific value, produced from a lignitic coal yielding about 8000 B.T.U., and containing about 30% ash. It is easy to see that if the fuel were pulverized coal of 12,000 B.T.U. value or crude oil, an initial temperature of 2900° at the bridge and 2550° , or better, at the throat would easily be attainable.

The old double-ended regenerative furnaces formerly

used at Great Falls,* Montana, showed a temperature of 2650° at the bridge and 2550° at the throat, or a drop of only 100°F. in a length of 41 ft. 6 in. At this low initial temperature, the furnace smelted 31.5 tons per 100 sq. ft. of hearth-area, the average temperature of the calcine charged being 788°. This furnace evidently worked under the same disadvantage as that at Kyshtim by having gas of low thermal value.

The above figures show that with regenerated or heated live air furnished at the point of combustion of the fuel a very even temperature can be maintained the entire length of the furnace, which, of course, is the ideal condition for obtaining the highest furnace capacity per unit of hearth-area in reverberatory smelting. This cannot be done in current practice, even under the best of conditions so far produced.

The latest data on this point are given† in the account of the work of Capt. Stout at the Copper Queen plant, which shows that reverberatory smelting is all a matter of applying or conserving heat-units. By enlarging the throat of the furnace and decreasing the velocity of the gases in the furnace he obtained higher continuous temperatures more evenly throughout the length of the furnace, but the limit was reached in two ways; the obstruction caused by the boilers prevented further development in this direction, and the temperature of the emitted waste gases became so high that the boiler-tubes burned out, showing that the limit of the use of waste-heat boilers from a mechanical standpoint was at least indicated. The data in the article upon the fuel-ratio and smelting-capacity of the furnace are of great importance on the effect of the proper conservation of the heat-units. It is pointed out that with calcine at 200° 0.95 bbl. of oil is required per ton of calcine smelted, but it is estimated that only 0.45 bbl. will be necessary with calcine charged at a temperature of 1150°F. This is of especial importance when considering the problem of smelting pyritic ore in a reverberatory furnace, and it is easy to see that with the high excess heat produced by the chemical reactions in treating this type of ore, a thoroughly mixed charge, at 1100° to 1300° can be considered practicable, if heat conservation in the roasting section be taken care of in the plant design by the insulation of hoppers and cars.

The above-mentioned Copper Queen data are all in reference to reverberatory furnaces, using waste-heat boilers, to save the heat-units from the waste gas leaving the furnace; they have no reference to the further development of reverberatory furnaces along the line of waste-heat saving by means of properly designed regenerators.

In the old days of grate-firing a ratio of 4 tons of calcine to 1 ton of coal, and the smelting of 10 to 12 tons of calcine per 100 sq. ft. of hearth-area was considered good average work for a reverberatory. With the intro-

duction of pulverized fuel the tonnage smelted per 100 sq. ft. of hearth-area increased to 21 or 22 with a fuel ratio of 6 tons of calcine per ton of coal. The increase in capacity is nearly 100% and the decrease in fuel consumption is 50%. This increased efficiency is due almost entirely to the more efficient method of burning the fuel. Three factors are principally responsible: (1) carbon or coke losses in ash are avoided; (2) complete combustion takes place instantaneously; (3) there is no moisture in the fuel; the actual efficiency of the furnace itself in using the developed heat-units is nearly the same relatively when burning pulverized coal as it was when the coal was fired on grates.

The average heat-balances of reverberatory furnaces using waste-heat boilers and emitting stack-gases at about 900°, and the thermal distribution is approximately as follows:

Heat absorbed in smelting, radiation, and other furnace losses 25% of B.T.U. in the fuel.

Waste-heat boiler credits 35% of B.T.U.

Lost up the stack at 900°, 40% of B.T.U.

The value 35% of the B.T.U. shown as waste-heat credit is of decidedly doubtful accuracy by virtue of the fact that no furnace synchronizes absolutely with the boilers; consequently at times the boilers are under-fired, and sometimes they are over-fired, thus causing them to 'blow-off', with a consequent loss of a portion of the B.T.U. that have been converted into steam and probably entered erroneously as a credit.

This condition necessitates that the central power-plant shall always have a boiler, or several boilers, under steam to act as a governor to regulate the steam required for maintaining the constant load. In small plants, of one or two furnaces, this condition is more exaggerated than in larger plants. I think that even with the recent improvements in reverberatory smelting this is still an important adverse factor and should modify the value of the steam from waste-heat boilers being considered as all real money, in terms of fuel in bins.

Now, bearing in mind the above figures and the line of argument, let us carefully examine what will be the position if we change our present practice to one in which we use a non-reversing regenerative reverberatory furnace for copper smelting, in order that we may recover the waste heat in such form that the saving becomes real and absolute. This positiveness of results is assured in regenerative furnaces only, since the furnace, dust-chamber, and regenerators are in a closed circuit and final heat-losses can only occur by radiation, or up the stack. It does not matter what the temperature of the gases is when leaving the throat of the furnace, as their heat is returned to the point of ignition, in order to reduce the quantity of initial fuel needed to maintain any desired temperature in the furnace. The additional advantage is shown in the working of the Kyshtim and Great Falls furnaces of maintaining an even temperature throughout the entire length of the hearth. This can never be accomplished so successfully and the same high temperature maintained throughout the furnace when using waste-heat boilers for two reasons: the boiler-

*E. P. Mathewson, 'The Development of the Reverberatory Furnace', Trans. A. I. M. E., Cleveland meeting, 1912.

†'Eng. & Min. Jour.', July 20, 1918. 'Notes on Recent Metallurgical Progress', by E. P. Mathewson.

tubes would burn out, and the eventual waste of heat-units in waste gases would be too high to be considered the full achievement of the greatest possible economy.

A heat-balance of the regenerative reverberatory furnace has been estimated, after a careful survey, as follows:

| | B.T.U. in fuel | % |
|---|----------------|----|
| Heat absorbed in furnace in smelting and radiation..... | 25 | 25 |
| Regenerator loss | 10 | 10 |
| Stack loss at 400° F. | 15 | 15 |
| B.T.U. returned to furnace through regenerator in live air..... | 50 | 50 |

So that in the regenerator there will be 35% plus 15%, equalling 50%, of the thermal value of the original fuel absorbed and transferred from the waste gases to live air, having no uncertain value, as the equivalent fuel is still 'on hand' in bins, or if it is used in the furnace it will smelt 100% more in quantity of charge.

It is obvious from these figures that even though the use of pulverized coal has decreased the amount of fuel required for smelting a ton of calcine by 50% and has increased the tonnage of calcine smelted per ton of fuel by 100% over grate-firing, this saving can again be repeated by the adoption of regeneration, as set out in the previous and in the following tables:

| Calcine Smelted Per 100 sq. ft. of Hearth-Area | Fuel ratio |
|--|------------|
| Grate-firing, 10 to 12 tons..... | 4:1 |
| Pulverized fuel or oil, 20 to 22 tons..... | 6:1 |
| With regenerative furnaces, 40 to 44 tons..... | 12:1 |

That these figures are in no wise chimerical has been demonstrated by the Great Falls regenerative furnaces smelting 31.5 tons per 100 sq. ft. of hearth-area with only 100° drop in temperature in 41.6 ft. of hearth-length and 360° temperature drop at Kyshtim in 90 to 100 ft. of hearth-length, in both cases having low initial temperatures on account of using fuel of low calorific value.

There is no reasonable doubt that the most efficient American reverberatory smelting practice so far recorded, was that of the old Great Falls regenerative furnaces with every possible factor that leads to success against them: a few of which were: (1) low B.T.U. value of the fuel used; (2) high ash and carbon loss in producers; (3) small old type of inefficient producers; (4) long gas-conduits; (5) regenerators of improper designs, but the standard of the period; (6) regenerators not of sufficient capacity to absorb waste-gas heat-units; (7) furnace too small in relation to the modern furnaces; (8) loss of efficiency due to checkers clogging with dust accretions.

It was with a knowledge of these facts and having to meet the condition of low-grade fuel, at a time when pulverized coal had not yet become a factor in smelting, that I sought a solution of the problem of the successful application of the regenerative principle to reverberatory furnace construction and practice, which eventually ended in the design given in the article in the 'Mining and Scientific Press' of June 2, 1917. This is essentially a dust-chamber, placed between the furnace and the regenerator, through which the gases pass at a reduced velocity, to settle the dust and semi-molten particles that escape through the throat of the furnace; and a double-chamber regenerator through which the

gas passes with an up-cast, in contrast to the old Siemens principle of no dust-settling appliance and a down-cast flow for the outgoing gases, in which the dust and semi-molten particles formed accretions on the top tiers of the checker-work and blocked up the whole area of the apertures. Such mechanical difficulties are overcome by the use of a chamber which takes out most of the dust that it is possible to settle, and that which does go over can do no harm, as with the up-cast feature any dust that settled out of the gases must fall back clear of the checker-work, where it can do no damage.

There is nothing new or mysterious about regenerative furnaces, as furnaces and their value has been demonstrated in steel practice. The open-hearth process of steel-making would probably never have been developed had it not been for the Siemens regenerative furnace, as the uniform temperature required cannot be maintained in the length of furnace necessary by direct firing, without incurring heat losses that would become an economic impossibility, as it is not the high temperature that is required at one point, but an even one throughout the length of the furnace that is the chief factor. The furnace temperature required is 2800 to 2900° F. The reversing or end-over-end principle is essential in open-hearth steel-making, otherwise the steel at the end farthest from the reducing action of the combustion of the fuel would be slightly oxidized; and this the reversing principle corrects.

In copper smelting, the single and non-reversing feature is nearly essential, because of the necessity of having one end of the furnace 'quiet' for slag-settling purposes. This fact was the second problem that was faced in solving the application of regenerative furnaces to copper smelting.

In all probability a smelting charge consisting of roasted pyrite and quartz flux of 94% SiO₂ such as would be used for pyritic smelting in blast-furnaces and at approximately 1150° would smelt with less applied fuel than a Copper Queen furnace-charge and give a higher metal recovery than either blast-furnace, or, a combination of blast and reverberatory furnaces, possibly could; so that power for air plus extraneous fuel has got to bear comparison with probably 120 lb. of 12,000 B.T.U. coal per ton of calcine in a regenerative reverberatory and make an equally good recovery to keep the blast-furnace in competition even for pyritic smelting.

The mechanical difficulty of smelting the type of charge producing a basic slag disappeared with the introduction of side charging of reverberatory furnaces, as it eliminates side-wall corrosion and the necessity for fettling. Another factor is that a high stack becomes unnecessary; in fact, it is to be avoided. The regenerator itself when properly constructed is a stack in a horizontal position; therefore all that is required further is a steel stack such as would be used for a boiler-plant. That this is no conjecture will be observed by a visit to any open-hearth steel-plant where each furnace has its own steel stack about 100 ft. high. The lower the

velocity of the gases in the furnace and regenerator, the greater will be the efficiency of the furnace.

It has been demonstrated that the blast-furnace is an obsolete machine for economical smelting. The reverberatory furnace with boilers for saving the waste heat from the outgoing gases has reached, or at least shown, its limitations of development, both mechanical and economical. At the same time the necessity for further progress in the economics of smelting has never been so great as today. The regenerative furnace is a logical development and strikes at the root of real economy.

A radical change today becomes obvious common sense tomorrow, but it takes time to break away from old ideas and get used to thinking in terms of new ones, as was the case with the adoption of the basic-lined converter, and of oil flotation, which, especially as to the latter, had considerable justification, because it involved accepting new principles, but with regenerators this should not be so, because their effectiveness for the recovery of waste-heat units has been known for years, even though the plan on which they were developed was not suitable for copper smelting. If, however, it had been possible to take a regenerator checker-work and canals filled with flue-dust and invert or turn it upside down, the obvious would have happened and the furnace would have continued working. This is precisely the principle of the design of the non-reversing regenerative furnace, with this addition, that a dust-settling chamber is provided to free the gases of the major portion of their dust, before proceeding to the inverted or upside-down regenerator, which again has further protection in so far that the checker-work is sectionalized into small parts and easily accessible, enabling any section to be removed and replaced while the furnace is in operation, or at the worst, shutting off the fuel for an hour or two. It will be apparent from this explanation that the regenerators as a whole are practically indestructible.

Having pointed out the structural features, I think it safe to repeat that from an operating standpoint it is not possible to create the favorable uniform temperature required for perfect smelting conditions except in a regenerative furnace, and that by the use of a properly balanced furnace unit an increase in capacity of 100% can be expected or a decrease in fuel consumption of 50% per ton of calcine smelted can be safely estimated. Referring back to the Copper Queen data, it is there estimated that 0.45 bbl. of oil per ton of calcine is required if the temperature of the calcine charged is 1150° F. If a regenerative furnace were used, this amount of oil may be divided by 2; thus 0.225 bbl. of oil per ton of calcine smelted or 122.5 lb. of coal at 12,000 B.T.U. per pound.

It is a pertinent fact that an attempt to operate a non-regenerative reverberatory furnace with waste-heat boilers attached and having a hearth-length of 100 ft. or 110 ft., and using fuel of such low calorific value, only creating an initial temperature at the bridge-wall of the furnace of 2650° to 2750° and a probable throat temperature of 1500° to 1600° would be a failure, because the slag bath would be 'frozen' some distance back

from the skimming-door, and the steam produced in the waste-heat boilers would be of little or no value.

It is also a fact that the old Great Falls regenerative furnaces, having a hearth-length of 41 ft. 6 in., but with inefficient regenerators and the Kyshtim furnace with a hearth-length of 90 or 100 ft., but with efficient regenerators, did use fuel of such low calorific value that it did create initial bridge-wall temperatures of only 2650° and 2750°, but, owing to the element of the conversion and regeneration of the waste-units to hot live air, the throat temperatures were only 100° less in 41 ft. 6 in. of hearth-length and 360° less in 100 ft. of hearth-length, respectively. These regenerative furnaces did work more successfully than any non-regenerative furnace ever recorded, even when this latter type is provided with fuel of the most concentrated and highest calorific value obtainable (fuel-oil). This is sufficient evidence to satisfy even the most skeptical of the effectiveness of the principle of converting the waste heat into regenerated live air returnable to the furnace; it is a logical step in the development of a machine for economical and efficient copper smelting.

WALTER G. PERKINS.

Palo Alto, California, July 7.

Employment Management

The Editor:

Sir—Referring to Mr. Nye's article on this subject in your issue of June 14, I beg to say that, irrespective of the abnormal labor conditions mentioned, Mr. Nye and the Eagle Mining Co. are pointing out the right course for the settlement of the labor problem. The workman is looking primarily for an 'honest deal'. Give it to him and convince him so clearly that he is getting it that no ranting agitator can shake his faith. You have a suspicious oft-cheated subject to convert, but it can be done; and with surprising ease, for it is the goal toward which he himself with his unions and lock-outs is striving.

Our method must include both cold-blooded statistics and an intelligent personal interest. Where statistics alone are relied upon a large labor turn-over is likely to occur. Where the personal factor predominates we often find inefficiency. A happy medium is the ideal. It is rather hard for a boss to attain this ideal without assistance from higher up.

One successful method of reducing the labor turn-over is in keeping the boss, second above the men, as aloof as possible and using him as a court of appeal. For instance, if the foreman can refrain from giving direct orders to the men, the shift-boss can use him as this court. There is a psychological effect from the realization by the worker that, besides pleasing the shift-boss, he must also please the foreman, whose criticism he never hears but who drops a word of praise for good work. Merited praise stimulates all of us.

Under Mr. Nye's system the employment manager assumes many of the duties of the court. This curb to hasty decisions is equally effective on the workman and on the boss.

The workingman goes to sleep each night with a lot of unused brain energy. This energy is continually seeking an outlet. If not intelligently directed, it often leads to some form of mischief. The majority of a man's inconsequential wrongs become real and all-absorbing during the hours he is whittling a stick. Consequently, given the usual normal crew of men, start them at poker or solo, provided you can think of nothing more original. But get them interested in something which will take care of that brain energy. And do not forget that you get the best out of a man when he is doing something of benefit to his fellow-man. Make a limited amount of his pleasure include something of this nature.

Butte, June 22.

J. C. METGER.

[This is a good letter; it contains many excellent suggestions.—EDITOR.]

'Extraction' or 'Recovery'?

The Editor:

Sir—In a recent communication of mine to your journal I made use of the word 'extraction' to signify the quantity of a given metal removed from an ore-pulp as shown by assay of the residue or tailing. If I remember rightly you, Sir, though you were good enough not to edit my term, have in time past taken exception to this use of the word 'extraction', holding that 'recovery' is correct at this stage of the process and that extraction does not take place until the metal in question has been reduced to a condition suitable for marketing. As I have never been able to see eye to eye with you in this distinction I hope you will allow me to set forth the opposite view with my reasons for favoring it.

There are two aspects of this question: the first is as it concerns concentration processes, in which the metallurgic content of the original ore is for the most part collected into a comparatively small bulk of material and thus separated from the gangue or worthless part, though in the majority of cases not in the metallic form, and the second as applied to leaching processes, in which water or a chemical solution is made to dissolve the desired metal or its salt and thus remove it from the gangue, leaving a comparatively worthless residue behind. Now considering the second case first, I can see no word that fits the circumstances better than 'extraction': under the word 'extract' Webster's dictionary gives, "To draw out, select, quote, distill." The word 'recover' has no suggestion of any idea common to the word 'extract', and is explained by the same authority as meaning "to get possession of again." Now the metal that is separated from the gangue by leaching (or, that is, as I claim, "extracted") we do not always "get possession of" ("recover"), as some of us who have operated cyanide plants know to our cost; therefore it seems to savor somewhat of counting one's chickens before they are hatched to say that we have recovered so many ounces of silver when that quantity has merely been extracted from the ore and has not as yet been safely stored in our strong-room.

Turning now to the aspect of the controversy that is concerned with the separation of a mineral containing the desired metal from the worthless part of the ore, the case is not quite so clear. Here, as you have already pointed out, when one has separated metal combined as a sulphide from the gangue one has not obtained metal but merely a mineral of the metal; it might therefore be asserted that literally one has not 'extracted' the metal; but, on the other hand, it seems equally plain that one has not 'recovered' the metal, but merely a product having a higher metal-content than the original ore. Thus the objection raised against the one word would apply with equal force to the other. What shall we do then? Shall we try to bring into use a new word that may more literally interpret the facts of the case, as for instance 'abstract'? This word seems to express fairly well the idea of "drawing away" the copper in whatever combination it may be found, from the worthless part of the ore, leaving it to a further process to extract or "draw it out" from its combination, though the use of the corresponding noun 'abstraction' would seem hardly so suitable. Or on the other hand, shall we waive literal accuracy for the sake of uniformity of nomenclature and adopt in the case of concentration the terms that are by the most common usage applied to leaching processes? After all, even in the case of concentration, if one looks at the question from the point of view of the tailing rather than of the concentrate, the copper that was originally associated with that tailing is there no longer; it has been 'drawn out' or 'selected'; its form after the operation does not matter to the tailing which only knows that its erstwhile companion has been by some means or other "drawn out of" or "extracted" from it.

To illustrate my understanding of the essential signification and differentiation of the two words in question, I will suppose that a certain man is breaking up a packing-case to make a kitchen-shelf for his better half. As a preliminary to further action, he will probably find it necessary to 'extract' the nails. He may then do one of two things: he may either throw away, or, if he is of thrifty disposition, he may straighten them out and put them into his tool box. If he does the latter he will have 'recovered' the nails in addition to having 'extracted' them.

E. M. HAMILTON.

San Francisco, July 5.

[The copper, for example, in a 2% ore is 'recovered' in a 35% concentrate, but it is 'extracted' in a 98% blister because this last is marketable as metal. The gold in a mill is 'recovered' in the cyanide solution, but it is not 'extracted' until precipitated in the zinc-box. Like the amalgam in a stamp-mill, the precipitate in a cyanide-plant is a product so concentrated and so valuable as to be marketable. Answering Mr. Hamilton's suggestion, we would say that the gold in solution is in our possession as compared with its former state in the crude ore, and that successful precipitation usually so nearly ensures extraction as to be considered an accomplished fact.—EDITOR.]

Prolonging the Life of the Roofs of Reverberatory Furnaces at Anaconda

By OLIVER E. JAGER

The present practice of building ribs on the roofs of the reverberatory furnaces at Anaconda is an interesting example of the revival of an old idea. At the Colorado smelter in Butte, the reverberatory roofs were built this way in 1899, and the scheme was tried on the first 50-ft. furnaces built at the present Anaconda reduction works in 1902. The lack of a sufficient variety of brick-shapes at that time caused the practice to be discontinued as impracticable. This difficulty has disappeared under present conditions, as plenty of different shapes are now

how the reverberatory furnaces burn out, the dotted line in the sectional view giving approximately the outline produced. The fluxing action of the fine material entering by the charging pipes, *P*, is probably assisted by the air that enters when the pipes are opened. Roasted flotation concentrate does not protect the side-walls of a furnace like coarser material, as the former is extremely mobile, and will run down instead of piling up along the

RIBS ON ROOF OF REVERBERATORY FURNACE

available. This is an important point, since the success of the scheme depends on good bonding, so that there will be no opening, nor falling, of the roof between the ribs when the furnace is allowed to cool for repairs. The idea is, that, when the roof has burned thin, the space between the ribs is filled with brickwork, thus forming a new roof on top of the old one. As the ribs project nine inches above the surface of the roof, the additional thickness of roof will be limited to this amount, but the furnace campaign will be prolonged about two months. The ribs also help to keep the wide roof from buckling or otherwise getting out of shape. The system has been in use at Anaconda for three years.

In filling between the ribs, the brickwork is bonded longitudinally, but no attempt is made to tie it into the ribs; nor is it necessary to build this nine-inch structure completely across the furnace, as the crown of the arch does not burn out as much as the parts near the walls. While the amount will vary according to the condition of the roof, it has usually been found sufficient, on a furnace 22 ft. wide, to extend the nine-inch structure seven or eight feet from the buckstays toward the crown. This is shown in the sketch (Fig. 1), which also illustrates

BONDING AT A-A

ROOF OF REVERBERATORY FURNACE

walls. As the present concentration practice at Anaconda results in the production of a large proportion of very fine material, it has been decided to increase the thickness of the side-walls of the reverberatories to 2 ft. 6 in. The plan shows the method of putting on the nine-inch brick work between the ribs. As there is nothing against which to set a skewback, the structure must be arched slightly.

The construction of the ribs can be understood from

the sketch, the skewbacks being placed on top of the roof against the buckstays. The ribs are made 15 in. wide, and every second row of bricks in the rib is tied into the roof of the furnace, except where the rib lies on the side-walls. The bonding of the rib is shown in cross-section along the line A A. The wedges are not driven at the crowns of the ribs till after the striking of the centres supporting the furnace-roof, as any settlement of the roof on the removal of the centres would throw a heavy stress on the rib, causing it to crack. It is not possible to give any exact spacing for the ribs on a roof, as this depends on circumstances, but it may be said, in general, that the spacing varies from 32 to 48 inches. It is best to butt them against the buckstays, but if this is not possible, owing to interfering with the charging-pipes, a plate may be placed to cover the space between two buckstays and the skewback set against the plate. The present practice at Anaconda is to put ribs, suitably spaced, over the entire length of the roof. Previously they were built on a portion of the roof only, extending about one-third the distance from the firing end.

The photograph shows the top of a furnace-roof with a rib at every buckstay.

Cost-Keeping for Small Metal Mines

By J. C. PICKERING

*The importance of keeping accurate accounts of costs at small or medium-size mines is not as well recognized as it might be. To obtain the greatest benefit from mining an operator must, among other things, have a clear accurate statement of his expenditures and income. This will entail the preparation of a suitable accounting system, supplemented by cost-sheets and contributory data. From the small independently owned 'one-man' mine, where profit and loss are determined solely by the bank balance, to the large mining corporation employing the best technical advice, with accounting and cost keeping executed in great detail, there is a wide transition.

A suitable and properly applied scheme of cost keeping will show, within limits determined by the size and complexity of the mining enterprise under consideration, the proper allocation of all operating and construction expenditures, and will enable the management to know at periodic intervals the cost of any particular item. Such information may aid largely in any general campaign of cost-cutting or in the elimination, as unpayable, of certain phases of the work.

Adequate and suitable cost-keeping methods are a direct corollary to efficient management. Both contribute largely to the success of any mining enterprise, and when combined they frequently turn failure into success. It is inconceivable that a manager can trace and promptly stop financial leaks unless he knows the detailed cost of the various operations that enter into the aggregate expenditure.

Both cost and financial statements may be so padded

with insignificant details as to obscure the main issues. A cost statement applicable to all types of mines is not possible, but skeleton suggestions that may be modified to suit the requirements of individual properties can with some confidence be offered.

A mine that has no transportation difficulties, and whose product is marketable without mechanical or other treatment, should present the simplest accounting and cost-keeping problem. In contrast to this the property whose ores are complex, or distinct in type, requiring several methods of treatment, may present a difficult problem, which may possibly be further complicated by involved methods of disposing of the final mine products; this type of mining enterprise might require an elaborate system of cost-sheets and accounts.

Too much stress cannot be laid upon the necessity for properly systematizing accounts and costs during the development and equipment stages of mining properties. The information so gathered will prove valuable and necessary not only during its period of execution, but also during the life of the mine.

During the period preparatory to production, mine reserves and surface stock piles may be created, or work such as stripping, which may subsequently be a direct charge against ore extraction, may be done. The cost of doing this preparatory work should be known in order that it may be subsequently charged against ore mined.

To devise a system of cost-keeping applicable to all mines is an impossibility, but general schemes capable of adaptation are presented and will be found in this useful publication.

Germany's War Sources of Sulphuric Acid

During the War, American chemists were puzzled as to the source of the enormous amount of sulphuric acid the Germans were able to secure. Information now in the hands of the U. S. Bureau of Mines shows that at no time was there any particular stringency in Germany's supply of this acid. During the early months of the War, before conventions could be made with neutral countries, large shipments of pyrite were made to Germany; in fact, the importation of pyrite into Germany continued in some volume throughout the War. This reserve built up at the beginning of the War gave Germany time to find new resources of sulphuric acid. A noteworthy development of the Meggen pyrite took place and other pyritic beds were opened in Germany and Hungary. Considerable sulphur was obtained from Asia Minor. In addition, Germany made important use of its rich beds of blende and galena, finding means to eliminate the lead-dust that has been a source of trouble in the contact process of manufacture. Kaiserite and plaster of paris also were sources of sulphuric acid, and some sulphur was obtained by purifying gas at coke-plants. As a matter of fact, sulphuric acid was so plentiful in Germany near the close of the War that restrictions on its use by industries were rapidly being lifted.

*Abstract from Technical Paper 223 of the U. S. Bureau of Mines, 1919.

Sulman & Picard v. Wolf

*IN THE HIGH COURT OF JUSTICE
CHANCERY DIVISION

Royal Courts of Justice
Saturday, 20th May, 1905

JUDGMENT

MR. JUSTICE BUCKLEY: I need not trouble you Mr. Bousfield.†

The plaintiffs sue for a sum of £166.16.3, for work and labor done, and for services rendered and moneys paid for the defendant. The claim divides itself into three parts, which I may take in the reverse order; the last is £4.4.3, which is not disputed; the last but one is £150, which is the sum agreed to be paid by an agreement contained in writing in letters of the 19 and 22nd February, 1904; and the first is a sum of £12.12.0 for certain work done in October and December, 1903. As regards the £150, that is quite plainly payable under the letters of February 1904 if the services have been rendered. The only possible contention against that is that the work was not properly done, which I will not dispose of under this head as I shall have something to say about it on the counter-claim. In my judgment that £150 is entitled to be recovered by the plaintiffs. They did the work and they have, therefore, become entitled to be paid the money agreed to be paid.

That leaves only the first item, or rather the first two items of £5.5.0 and £7.7.0. As to those the only point is this; the defendant says that as regards the sum of £12.12.0, which he does not dispute is a fair sum—I think it was said to be an agreed sum—there was some bargain that he should not be asked to pay it until a man named Johnson, who was putting up some plant, had solved certain difficulties as regards the plant. The plaintiffs say nothing of the sort took place. There was no connection at all as a matter of good sense and good reason between the fact that the plaintiffs had made the inspection, which they did make, and that Johnson, the contractor employed to make the plant, had not done what he ought to have done: there is no reason why there should have been such a bargain, and upon the evidence I arrive at the conclusion that there was not such a bargain. It is a small matter and, at most, I think the result of the evidence is that the plaintiffs said that inasmuch as Johnson's difficulties, it was thought, would have been settled in a few days, they were not going to ask for immediate payment. Something of that sort might have been said, though I do not think it was; but, at any rate, there was no bargain to postpone the payment indefinitely. I may say that when the account was sent in, which it was in April 1904, no

complaint of any sort or kind was made as to any of the matters which are complained of now; and there are letters on the 4th May, 16th May, 2nd June, 14th June, 28th June, and 8th July all asking for payment, in answer to none of which was any sort of complaint set up; the defendant simply did not pay. Ultimately the writ was issued, and it was necessary to obtain an order for substituted service. There was no complaint made at all till the counter-claim came in in this action. I arrive at the conclusion, therefore, that the claim is sustained, and there must be judgment for £166.16.3, unless something arises upon the counter-claim.

I may say, however, before parting with it, that in another action which has been brought by Johnson, the maker of the plant, against Wolf, the defendant in this action, for the amount payable for the plant, Wolf counter-claims against Johnson for £166.6.8, which is the same as this sum with a trifling difference of a few shillings, as being the amount properly payable by him to the plaintiffs in this action.

Really the substantial contest between the parties does not arise upon the claim, but upon the counter-claim, and that is a more serious matter because it is an attack upon the character of the plaintiffs. Broadly stated, the case which the counter-claim seeks to set up is this: that the plaintiffs were dishonest in their dealings with the defendant; that, being employed by him to investigate a certain process, they acquired information in the course of their employment and, to put it in a short and crisp way, they stole that which belonged to him, appropriated it to themselves, and took out certain patents in respect of certain discoveries which they had found for him, and which they ought to have kept for him. Now is that true? Before approaching the fact as regards that I desire to say this, that from the first the defendant was perfectly well aware that these people were employed by other people to investigate similar processes. They appear to be gentlemen of eminence in their profession who were engaged, not only for Mr. Wolf but for other people, investigating processes similar to this. There is a letter before he first instructed them, namely on the 15th November 1902, in which they add by way of postscript, "We think it right to acquaint you with the fact that we are now advising other parties on another oil process which, however, is essentially different to your own." So they frankly tell him from the first that he was not the only employer upon processes of this description.

The next date which I have noted is the 15th September, 1903—that is to say, before the particular matters which are the subject of charge here in the claim had been undertaken by the plaintiffs, which comes from the defendant's diary. I have not got a copy of the diary,

*For explanation, see editorial page.

†Counsel for plaintiffs.

but the substance of my note about it is this, that Sulman, one of the plaintiffs, then told him that he was interested in one of these other processes, the Cattermole process, outside his professional interest. As I will state presently, the fact was that the firm had an interest in that process. He was told on the 15th September 1903 that they had a commercial interest in that process, as distinguished from the mere interest of being employed to investigate it. On the 19th February 1904 there is a letter which seems to me honest in every particular, in which they told him before they were going to resume work for him, the work which was the subject of the £150 claim in the writ: "Since writing to you on the 23rd ult., certain information has come to us, which, in view of your present proposal, we think it only right that we should put before you. Our information is in connection with another oil process which you are aware we were investigating. This process has recently made considerable progress and though we are not free to give you any details of it, we are of opinion that it will be a most serious competitor to you and will, we think eventually prove itself superior to any existing process based on the use of oil." Then they go on to say, "in view of our opinion of its probably proving superior we do not feel justified in accepting fees from you for developing your process without first giving such information and opinion as the above. We should therefore suggest to you that you might prefer to engage the assistance of some other firm to carry out your proposed trials," and so on. Then they go on to say: If you are minded still to employ us our terms will be, so and so. In the 22nd February he wrote back in that state of things "I have to thank you for your letter of the 19th inst., and am quite content that the work should proceed on the footing of our existing agreement as modified by that letter." I think the position as between the plaintiffs and the defendant a perfectly honest one. They were engaged upon other similar processes and they told him so. They told him it was competing with his: they told him they had an interest in it other than their professional interest, and he says, "Never mind, you are the best men for my work, I wish to employ you." They were employed, and he now declines to pay them. Now he says under Article 4 of the agreement of February 1903 which they entered into with him when this business was initiated, that they were bound, as they were, to give him the benefit of all discoveries, inventions, designs, and improvements from time to time discovered, made, or worked out or in course of investigation or experiment by the plaintiffs or their assistants in connection with the said process or system; so that if in their investigations for him they came across something valuable, he was to have the benefit of it." I now want to state in general terms why I am of opinion that they have done nothing at all in breach of that obligation as between them and him. In order to do that I must describe as shortly as I can, not what actually the nature of the two processes was, but what the diversity between the two processes was. There is a process of dealing with oils

called the Elmore process, which for my purpose is sufficiently described by saying that it consists in so dealing with powdered ore—a system, therefore of broken rock and sand, I may call it—and metallic particles by the introduction of water and oil as that the sand shall become loaded with water, and shall sink, and the metal shall become engaged by the oil and shall float. It is a process by which the oil is separated from the sand or gangue by flotation of heavier material, namely the mineral, by it being supported by what I may describe as little rafts of oil. The process in which Wolf was interested was a process of that description. It was of the Elmore type, which was the subject of a patent by one Scammell. Scammell's improvement upon the Elmore process, I gather, was this, that he found by treating the oil with chloride of sulphur he was able to increase the viscosity and cohesion of the materials, and he got a better result in treating his minerals with oil by employing chloride of sulphur in certain proportions with the oil with which he was going to make it. That was the nature of the Scammell process, which was the process in which Wolf was interested; and therefore what the plaintiffs were employed by Wolf to do was to find out all about improvements in a system by which the mineral was to be separated from the gangue by flotation by the use of oil treated with chloride of sulphur. Well, they investigated that, and there are a number of reports which have been read; the result was that ultimately a patent was taken out of the defendant, Wolf's method, No. 4793 of 1904. The patent is for this oil and chloride of sulphur process, and the object to be attained is flotation in the way in which I have described: but it also comprised this, on which reliance has been placed, that after you have dealt with the pulp and separated your gangue from your mineral with the result that the gangue is at the bottom and the mineral at the top, the gangue was allowed to pass out of the foot or at the bottom of the spitzkasten, or the vessel in which it was treated, into a tank which is marked 'L' in the Wolf patent. On the Wolf specification you will find that the object of 'L' was this: it was so made that you got in 'L' sand mixed with oil and as they did not want to waste their oil and they wanted to get the oil out of the sand again, in order to do that there was introduced a current of air into the bottom of tank 'L' which was driven up through the oil-laden sand with the result that that drove the oil to the top and you recovered the oil; and the Wolf patent in its fourth claim claims this "in separating mineral constituents of oil from gangue by means of oil recovering oil from the waste pulps by blowing up through them currents of air with or without steam substantially as described." It is quite true that in those tailings there might be some portion of mineral also; it depended upon how efficiently you conducted your process whether there was much or little, and if there was a little you might get some of it back with the oil. But that was not the object of Wolf's patent; the object of Wolf's patent was to recover the oil, and, mark you, to recover the oil by blowing up through the tailings currents of air. That is a sufficient

description of the thing in which Wolf was interested.

Now the other matter which the plaintiffs were investigating was a different system altogether; it was the Cattermole process. Now Cattermole's process was this: he intended to use a very small quantity of oil. He begins by saying that hitherto the proportion of oil used has been so great that the mineral matter adhering to the oil floats. He says, "I am not going to do that: I am going to use a very small quantity of oil, and my object is that my mineral shall not float but shall sink, and I intend to recover it in this way: I am going to use oil emulsified with water preferably with the addition of an emulsifying agent such as soap," and he says: "I find if I do that I take care not to get oil enough to float the mineral. I let my mineral sink, and my emulsifying agent, the soap, has an effect by which the mineral becomes agglomerated or granulated by the oil which adheres in the form of a thin film to the metallic constituents which sink." So the essential difference between these two is that Scammell and Wolf send the material upwards by flotation by the oil, and Cattermole, by the things which he is going to describe, acting upon it makes the mineral with the oil go down, and they are to be found at the bottom of the pan in which it is treated. There were two patents of Cattermole's 22695 and 22696 of 1902 which describe a process of that description. Now this is the other process which the plaintiffs were treating and which the defendant Wolf has been told they had an interest other than a professional interest in. There was another patent of Cattermole's No. 17109 of 1903, and ultimately there was a patent which was introduced by amendment two or three weeks ago, I think it is, in the Pleadings which has been relied upon, No. 20419 of 1903 of Sulman & Picard, the plaintiffs. The idea is the same in this sense, that the process now which has to be used, instead of emulsifying your oil, using a very small quantity of oil and an emulsifying agent, and agglomerating your mineral at the bottom, Sulman & Picard devised this idea; spray into your mineral which is to be treated, oil in minute globules, and also use air, and you will find that the little globules of oil having an affinity for the mineral will engage the mineral, and that little bubbles of air or gas will attach themselves to the oily surface of the mineral, the result of which will be that you will get flotation. You will no longer have a Cattermole sinkage; you will get a flotation, but a flotation by a totally different idea and process to that which was involved in the Elmore and Scammell processes. This is not flotation by oil at all, but flotation by the use of a small quantity of oil, with the result that you get bubbles of air or gas attached, and thus you get flotation by air and not flotation by oil. That is a claim which is totally and radically different, as it seems to me, to anything involved in the Scammell process. Now how is that in any way within Article 4 of this agreement as something which is found out in connection with the said process or system, that is to say the Scammell process or system? It had nothing to do with it. It was a different matter altogether. Then says the defendant: "But here

you are using the system of a jet, and a jet is used in my tank 'L', and therefore you ought to give me as an improvement, or as a further development of the idea in my tank 'L' your idea of using the jet so as to get flotation by oil." To my mind there is no connection between the two. The only point of resemblance is that they both use a jet, but the object of the jet in Wolf's process was by the insertion of a jet of air to dislocate, agitate, or interfere with a mixed mass of sand and oil for the purpose of driving out the oil; it was to recover the oily matter from the tailings. The object in the Sulman & Picard patent was not at that stage of the process at all. It was a process by which not the oil was to be recovered which had been left in the tailings, but by which the mineral was to be engaged and caused to float and be separated from the gangue; and I confess I do not understand how it could be said that these gentlemen by discovering that which is said to have originated by the dropping of a grape, which had been touched by a greasy finger, into a glass of champagne—that in that they were making use for their own purposes of anything whatever which was connected with the process which they were investigating for the defendant. Having said that, I do not know that I need go on and investigate all these various matters which have been dealt with in the evidence. It is quite plain that Mr. Wolf is a person whom I may venture to say is of a nervous and suspicious frame of mind. Of course, I ought also to say that the plaintiffs have some reason for complaint in that, if he thought at any time they were not treating him fairly, he did not go and tell them so.

There is an entry in his diary on the 19th February, which is the date when this letter was written to him telling him about this competition, which shows that his mind was then in a state of suspicion and he was expecting something of the kind; but, notwithstanding that, he instructed them to go on and act for him. He says further there was some default on their part as regards the use of this Roumanian oil in the process they carried out for him. The result of the evidence as to that seems to me to be that this Roumanian oil was, for the purposes of the laboratory experiments, effective; nobody denies it. When they came to use the process with the plant which Johnson had put up, or was putting up, whether by reason of some defect in the plant, or by reason of the fact that the Roumanian oil was not the best thing to be used, it did not succeed; but there is nothing in that to show that they did not render their services to the best of their ability in the work they had to do.

The result, therefore, at which I arrive is this, that there must be judgment on the claim for £168.16.3 with costs and the counter-claim I dismiss with costs.

THERE ARE 200 engineering societies in the United States, with a total membership of 100,000, the annual dues amounting to \$1,000,000. There are possibly 200 other societies more or less connected with engineering, and having many engineers as members. Probably 100,000 other engineers do not belong to any society.

A Safe Stair-Tread

STAFF CORRESPONDENCE

The accompanying illustration shows the design of a stair-tread having several good points. Steel stairways are a usual feature about smelting works, but it is not

A SAFE STAIR-TREAD

every design that can be qualified as being safe under out-door conditions. Usually, stair-treads consist either of a channel filled with concrete, or of a casting having a raised checkered surface to give a grip to the foot. Both these types collect dirt, flue-dust, mud, and snow if placed out of doors, all of which tend to make a stairway unsafe. Ice, of course, is the greatest danger on stairs, and the only remedy for it is vigilance on the part of the 'Safety First' men, so that no water be allowed to drip where it may freeze on a stair.

The grid type shown herewith seems specially adapted for outside use, as no snow can collect on it, while muddy feet tend to be automatically scraped in ascending. Although the grid stair-tread is not a novelty, this particular design is neat and simple. As shown in the sketch, besides being bolted to the outside channels, the grid is supported at the ends by angles rivetted to these channels. The several bars of $2\frac{1}{4}$ by $\frac{7}{8}$ -in. iron forming the stair-tread are kept in equal spacing by pipe distance-pieces slipped on the $\frac{7}{8}$ -in. bolts.

HOPE OF SUPPLYING the world's requirements for platinum rests largely with Colombia. Extraction in the Urals probably is at a practical standstill, owing to unsettled conditions in Russia. Furthermore, trend of production for years immediately preceding the War would indicate the peak of production there had been passed. Colombia has gradually increased her output from 10,000 troy ounces in 1910 to approximately 50,000. It is estimated that with new developments in operation, she will be able to produce at least 75,000 ounces per year. As the alluvial deposits along the river-beds of Colombia have been little worked for platinum, and other large areas have not been worked at all, it is probable production can be gradually increased and that the peak will not be reached for some time. In the past, interest has been centred on gold rather than on platinum in Colombia. Total known supply of platinum produced to date has been estimated at 5,000,000 to 10,000,000 troy ounces.

DETAILS OF SAFE STAIR-TREAD

Full Text of the Revised Covenant of the League of Nations

[Changes From Original Draft Are Indicated in Italics]

PREAMBLE

In order to promote international co-operation and to achieve international peace and security, by the acceptance of obligations not to resort to war, by the prescription of open, just, and honorable relations between nations, by the firm establishment of the understandings of international law as to actual rule of conduct among Governments, and by the maintenance of justice and a scrupulous respect for all treaty obligations in the dealings of organized peoples with one another, the high contracting parties agree to this covenant of the League of Nations.

[In the original preamble the last sentence read, "adopt this constitution," instead of "agreed to this covenant."]

ARTICLE I.

The original members of the League of Nations shall be those of the signatories which are named in the annex to this covenant and also such of those other States named in the annex as shall accede without reservation to this covenant. Such accessions shall be effected by a declaration deposited with the Secretariat within two months of the coming into force of the covenant. Notice thereof shall be sent to all other members of the League.

Any fully self-governing State, dominion, or colony not named in the annex may become a member of the League if its admission is agreed to by two-thirds of the Assembly, provided that it shall give effective guarantees of its sincere intention to observe its international obligations, and shall accept such regulations as may be prescribed by the League in regard to its military and naval forces and armaments.

Any member of the League may, after two years' notice of its intention so to do, withdraw from the League, provided that all its international obligations and all its obligations under this covenant shall have been fulfilled at the time of its withdrawal.

[This article embodies the old Article VII. The first paragraph is new. In view of the insertion of the covenant in the peace treaty, specific provision as to the signatories of the treaty, who would become members of the League, and also as to neutral States to be invited to accede to the covenant, were obviously necessary. The paragraph also provides for the method by which a neutral State may accede to the covenant. The third paragraph of Article I is new, providing for the withdrawal of any member of the League on a notice given of two years. No mention of withdrawal was made in the original document.]

ARTICLE II.

The action of the League under this covenant shall be effected through the instrumentality of an Assembly and of a Council, with a permanent Secretariat.

[Originally this was a part of Article I. It gives the name Assembly to the gathering of representatives of the members of the League, formerly referred to merely as "the body of delegates."]

ARTICLE III.

The Assembly shall consist of representatives of the members of the League.

The Assembly shall meet at stated intervals and from time to time, as occasion may require, at the seat of the League or at such other place as may be decided upon.

The Assembly may deal at its meetings with any matter within the sphere of action of the League or affecting the peace of the world.

At meetings of the Assembly each member of the League shall have one vote, and may have not more than three representatives.

[This embodies parts of the original Articles I, II, and III, with only minor changes. It refers to "members of the League" where the term "high contracting parties" originally was used, and this change is followed throughout the revised draft.]

ARTICLE IV.

The Council shall consist of representatives of the United States of America, of the British Empire, of France, of Italy, and of Japan, together with representatives of four other members of the League. These four members of the League shall be selected by the Assembly from time to time in its discretion. Until the appointment of the representatives of the four members of the League first selected by the Assembly, representatives of (blank) shall be members of the Council.

With the approval of the majority of the Assembly, the Council may name additional members of the League whose representatives shall always be members of the Council; the Council with like approval may increase the number of members of the League to be selected by the Assembly for representation to the Council.

The Council shall meet from time to time as occasion may require, and at least once a year, at the seat of the League, or at such other place as may be decided upon.

The Council may deal at its meetings with any matter within the sphere of action of the League or affecting the peace of the world.

Any member of the League not represented on the Council shall be invited to send a representative to sit as

a member at any meeting of the Council during the consideration of matters specially affecting the interests of that member of the League.

At meetings of the Council each member of the League represented on the Council shall have one vote, and may have not more than one representative.

[This embodies that part of the original Article III designating the original members of the Council. The second paragraph is new, providing for a possible increase in the Council should other powers be added to the League of Nations whose present accession is not anticipated. The two last paragraphs are new, providing specifically for one vote for each member of the League in the Council, which was understood before, and providing also for one representative of each member of the League.]

ARTICLE V.

Except where otherwise expressly provided in this covenant, or by the terms of this treaty, decisions at any meeting of the Assembly or of the Council shall require the agreement of all the members of the League represented at the meeting.

All matters of procedure at meetings of the Assembly or of the Council, the appointment of committees to investigate particular matters, shall be regulated by the Assembly or by the Council and may be decided by a majority of the members of the League represented at the meeting. The first meeting of the Assembly and the first meeting of the Council shall be summoned by the President of the United States of America.

[The first paragraph requiring unanimous agreement in both Assembly and Council, except where otherwise provided, is new. The phrase "or by the terms of this treaty" was an alteration proposed by President Wilson in moving the adoption of the covenant, to make it conform to the peace treaty proviso of a majority vote. The second paragraph was originally included in Article IV.]

ARTICLE VI.

The permanent Secretariat shall be established at the seat of the League. The Secretariat shall comprise a Secretary General and such secretaries and staff as may be required.

The first Secretary General shall be the person named in the annex; thereafter the Secretary General shall be appointed by the Council, with the approval of the majority of the Assembly.

The secretaries and the staff of the Secretariat shall be appointed by the Secretary General, with the approval of the Council.

The Secretary General shall act in that capacity at all meetings of the Assembly and of the Council.

The expenses of the Secretariat shall be borne by the members of the League in accordance with the apportionment of the expenses of the International Bureau of the Universal Postal Union.

[This replaces the original Article V. In the original the appointment of the first Secretary General was left to the Council, and approval of the majority of the

Assembly was not required for subsequent appointments.]

ARTICLE VII.

The seat of the League is established at Geneva.

The Council may at any time decide that the seat of the League shall be established elsewhere.

All positions under or in connection with the League, including the Secretariat, shall be open equally to men and women.

Representatives of the members of the League and officials of the League, when engaged on the business of the League, shall enjoy diplomatic privileges and immunities.

The buildings and other property occupied by the League or its officials, or by representatives attending its meetings, shall be inviolable.

[Embodying parts of old Articles V and VI, this article names Geneva instead of leaving the seat of the League to be chosen later, and adds the provision for changing the seat in the future. The third paragraph, opening positions to women equally with men, is new.]

ARTICLE VIII.

The members of the League recognize that the maintenance of a peace requires the reduction of national armaments to the lowest point consistent with the national safety and the enforcement by common action of international obligations.

The Council, taking account of the geographical situation and circumstances of each State, shall formulate plans for such reduction for the consideration and action of the several Governments.

Such plans shall be subject to reconsideration and revision at least every ten years.

After these plans shall have been adopted by the several Governments, limits of armaments therein fixed shall not be exceeded without the concurrence of the Council.

The members of the League agree that the manufacture by private enterprise of munitions and implements of war is open to grave objections. The Council shall advise how the evil effects attendant upon such manufacture can be prevented, due regard being had to the necessities of those members of the League which are not able to manufacture the munitions and implements of war necessary for their safety.

The members of the League undertake to interchange full and frank information as to the scale of their armaments, their military and naval programs and the condition of such of their industries as are adaptable to warlike purposes.

[This covers the ground of the original Article VIII, but is rewritten to make it clearer that armament reduction plans must be adopted by the nations affected before they become effective.]

ARTICLE IX.

A permanent commission shall be constituted to advise the Council on the execution of the provisions of Articles I and VIII and on military and naval questions generally.

[*Unchanged except for the insertion of the words "Article I."*]

ARTICLE X.

The members of the League undertake to respect and preserve as against external aggression the territorial integrity and existing political independence of all members of the League. In case of any such aggression or in case of any threat or danger of such aggression, the Council shall advise upon the means by which this obligation shall be fulfilled.

[*Virtually unchanged.*]

ARTICLE XI.

Any war or threat of war, whether immediately affecting any of the members of the League or not, is hereby declared a matter of concern to the whole League, and the League shall take any action that may be deemed wise and effectual to safeguard the peace of nations. In case any such emergency should arise, the Secretary General shall, on the request of any member of the League, forthwith summon a meeting of the Council.

It is also declared to be the fundamental right of each member of the League to bring to the attention of the Assembly or of the Council any circumstance whatever affecting international relations which threatens to disturb either the peace or the good understanding between nations upon which peace depends.

[*In the original it was provided that the "high contracting parties reserve the right to take any action," &c., where the revised draft reads, "The League shall take any action."*]

ARTICLE XII.

The members of the League agree that if there should arise between them any dispute likely to lead to a rupture they will submit the matter either to arbitration or an inquiry by the Council, and they agree in no case to resort to war until three months after the award by the arbitrators or the report by the Council.

In any case under this article the award of the arbitrators shall be made within a reasonable time, and the report of the Council shall be made within six months after the submission of the dispute.

[*Virtually unchanged except that some provisions of the original are eliminated for inclusion in other articles.*]

ARTICLE XIII.

The members of the League agree that whenever any dispute shall arise between them which they recognize to be suitable for submission to arbitration and which cannot be satisfactorily settled by diplomacy, they will submit the whole subject matter to arbitration. Disputes as to the interpretation of a treaty, as to any question of international law, as to the existence of any fact, which, if established, would constitute a breach of any international obligation, or as to the extent and nature of the reparation to be made for any such breach, are declared to be among those which are generally suitable for submission to arbitration. For the consideration of any

such dispute the court of arbitration to which the case is referred shall be the court agreed on by the parties to the dispute or stipulated in any convention existing between them.

The members of the League agree that they will carry out in full good faith any award that may be rendered and that they will not resort to war against a member of the League which complies therewith. In the event of any failure to carry out such an award, the Council shall propose what steps should be taken to give effect thereto.

[*This article shows a few minor changes. But the second sentence is new, inasmuch as it undertakes to give instances of disputes which are generally suitable for submission to arbitration, instances of what have latterly been called "justiciable" questions.*]

ARTICLE XIV.

The Council shall formulate and submit to the members of the League for adoption plans for the establishment of a permanent court of international justice. The court shall be competent to hear and determine any dispute of an international character which the parties thereto submit to it. The court may also give an advisory opinion upon any dispute or question referred to it by the Council or by the Assembly.

[*Unchanged except for the addition of the last sentence.*]

ARTICLE XV.

If there should arise between members of the League any dispute likely to lead to a rupture, which is not submitted to arbitration as above, the members of the League agree that they will submit the matter to the Council. Any party to the dispute may effect such submission by giving notice of the existence of the dispute to the Secretary General, who will make all necessary arrangements for a full investigation and consideration thereof. For this purpose the parties to the dispute will communicate to the Secretary General, as promptly as possible, statements of their case, all the relevant facts and papers; the Council may forthwith direct the publication thereof.

The Council shall endeavor to effect a settlement of any dispute, and if such efforts are successful, a statement shall be made public, giving such facts and explanations regarding the dispute and terms of settlement thereof as the Council may deem appropriate.

If the dispute is not thus settled, the Council either unanimously or by a majority vote shall make and publish a report containing a statement of the facts of the dispute and the recommendations which are deemed just and proper in regard thereto.

Any member of the League represented on the Council may make public a statement of the facts of the dispute and of the conclusions regarding the same.

If a report by the Council is unanimously agreed to by the members thereof other than the representatives of one or more of the parties to the dispute, the members of the League agree that they will not go to war with any

party to the dispute which complies with the recommendations of the report.

If the Council fails to reach a report which is unanimously agreed to by the members thereof, other than the representatives of one or more of the parties to the dispute, the members of the League reserve to themselves the right to take such action as they shall consider necessary for the maintenance of right and justice.

If the dispute between the parties is claimed by one of them, and is found by the Council to arise out of a matter which by international law is solely within the domestic jurisdiction of that party, the Council shall so report and shall make no recommendations as to its settlement.

The Council may in any case under this article refer the dispute to the Assembly. The dispute shall be so referred at the request of either party to the dispute, provided that such request be made within fourteen days after the submission of the dispute to the Council.

In any case referred to the Assembly all the provisions of this article and of Article XII relating to the action and powers of the Council shall apply to the action and powers of the Assembly, provided that a report made by the Assembly, if concurred in by the representatives of those members of the League represented on the Council and of a majority of the other members of the League, exclusive in each case of the representatives of the parties to the dispute, shall have the same force as a report by the Council concurred in by all the members thereof other than the representatives of one or more of the parties to the dispute.

[The seventh paragraph specifically excluding matters of "domestic jurisdiction" from action by the Council is new. In the last sentence the words "if concurred in by the representatives of those members of the League represented on the Council," &c., have been added.]

ARTICLE XVI.

Should any member of the League resort to war in disregard of its covenants under Articles XII, XIII, or XV, it shall ipso facto be deemed to have committed an act of war against all other members of the League, which hereby undertake immediately to subject it to the severance of all trade or financial relations, the prohibition of all intercourse between their nationals and the nationals of the covenant-breaking State, and the prevention of all financial, commercial, or personal intercourse between the nationals of the covenant-breaking State and the nationals of any other State, whether a member of the League or not.

It shall be the duty of the Council in such case to recommend to the several Governments concerned what effective military or naval forces the members of the League shall severally contribute to the armaments of force to be used to protect the covenants of the League.

The members of the League agree, further, that they will mutually support one another in the financial and economic measures which are taken under this article, in order to minimize the loss and inconvenience resulting from the above measures, and that they will mutually

support one another in resisting any special measures aimed at one of their number by the covenant-breaking State and that they will take the necessary steps to afford passage through their territory to the forces of any of the members of the League which are co-operating to protect the covenants of the League.

Any member of the League which has violated any covenant of the League may be declared to be no longer a member of the League by a vote of the Council concurred in by the representatives of all the other members of the League represented thereon.

[Unchanged except for the addition of the last sentence, providing for an expulsion from the League under certain extraordinary circumstances.]

ARTICLE XVII.

In the event of a dispute between a member of the League and a State which is not a member of the League, or between States not members of the League, the State or States not members of the League shall be invited to accept the obligations of membership in the League for the purpose of such dispute, upon such conditions as the Council may deem just. If such invitation is accepted, the provisions of Articles XII to XVI, inclusive, shall be applied with such modifications as may be deemed necessary by the Council.

Upon such invitation being given, the Council shall immediately institute an inquiry into the circumstances of the dispute and recommend such action as may seem best and most effectual in the circumstances.

If a State so invited shall refuse to accept the obligations of membership in the League for the purposes of such dispute, and shall resort to war against a member of the League, the provisions of Article XVI shall be applicable as against the State taking such action.

If both parties to the dispute, when so invited, refuse to accept the obligations of membership in the League for the purposes of such dispute, the Council may take such measures and make such recommendations as will prevent hostilities and will result in the settlement of the dispute.

[Virtually unchanged.]

ARTICLE XVIII.

Every convention or international engagement entered into henceforward by any member of the League shall be forthwith registered with the Secretariat, and shall, as soon as possible, be published by it. No such treaty or international engagement shall be binding until so registered.

[Same as original Article XXIII.]

ARTICLE XIX.

The Assembly may, from time to time, advise the reconsideration by members of the League of treaties which have become inapplicable, and the consideration of international conditions whose continuance might endanger the peace of the world.

[Virtually the same as original Article XXIV.]

ARTICLE XX.

The members of the League severally agree that this covenant is accepted as abrogating all obligations or understandings inter se which are inconsistent with the terms thereof, and solemnly undertake that they will not hereafter enter into any engagements inconsistent with the terms thereof.

In case a member of the League shall, before becoming a member of the League, have undertaken any obligations inconsistent with the terms of this covenant, it shall be the duty of such member to take immediate steps to procure its release from such obligations.

[Virtually the same as original Article XXV.]

ARTICLE XXI.

Nothing in this covenant shall be deemed to affect the validity of international engagements such as treaties of arbitration or regional understandings like the Monroe Doctrine for securing the maintenance of peace.

[Entirely new.]

ARTICLE XXII.

To those colonies and territories which as a consequence of the late war have ceased to be under the sovereignty of the States which formerly governed them, and which are inhabited by peoples not yet able to stand by themselves under the strenuous conditions of the modern world, there should be applied the principle that the well being and development of such peoples form a sacred trust of civilization, and that securities for the performance of this trust should be embodied in this covenant.

The best method of giving practicable effect to this principle is that the tutelage of such peoples be intrusted to advanced nations who, by reason of their resources, their experience, or their geographical position, can best undertake this responsibility, and who are willing to accept it, and that this tutelage should be exercised by them as mandatories on behalf of the League.

The character of the mandate must differ according to the stage of development of the people, the geographical situation of the territory, its economic condition and other similar circumstances. Certain communities formerly belonging to the Turkish Empire have reached a stage of development where their existence as independent nations can be provisionally recognized subject to the rendering of administrative advice and assistance by a mandatory until such time as they are able to stand alone. The wishes of these communities must be a principal consideration in the selection of the mandatory.

Other peoples, especially those of Central Africa, are at such a stage that the mandatory must be responsible for the administration of the territory under conditions which will guarantee freedom of conscience or religion subject only to the maintenance of public order and morals, the prohibition of abuses such as the slave trade, the arms traffic, and the liquor traffic, and the prevention of the establishment of fortifications or military and

naval bases and of military training of the natives for other than police purposes, and the defense of territory, and will also secure equal opportunities for the trade and commerce of other members of the League.

There are territories, such as Southwest Africa and certain of the South Pacific islands, which, owing to the sparseness of their population or their small size or their remoteness from the centres of civilization or their geographical contiguity to the territory of the mandatory and other circumstances can be best administered under the laws of the mandatory as integral portions of its territory, subject to the safeguards above mentioned in the interests of the indigenous population. In every case of mandate, the mandatory shall render to the Council an annual report in reference to the territory committed to its charge.

The degree of authority, control, or administration to be exercised by the mandatory, if not previously agreed upon by the members of the League, shall be explicitly defined in each case by the Council.

A permanent commission shall be constituted to receive and examine the annual reports of the mandatories and to advise the Council on all matters relating to the observance of the mandates.

[This is the original Article XIX virtually unchanged, except for the insertion of the words "and who are willing to accept," in describing nations to be given mandates, thus explicitly introducing the principle that a mandate cannot be forced upon a nation unwilling to accept it.]

ARTICLE XXIII.

Subject to and in accordance with the provisions of international conventions existing or hereafter to be agreed upon, the members of the League (a) will endeavor to secure and maintain fair and humane conditions of labor for men, women, and children, both in their own countries and in all countries to which their commercial and industrial relations extend, and for that purpose will establish and maintain the necessary international organizations; (b) undertake to secure just treatment of the native inhabitants of territories under their control; (c) will intrust the League with the general supervision over the execution of agreements with regard to the traffic in women and children, and the traffic in opium and other dangerous drugs; (d) will intrust the League with the general supervision of the trade in arms and ammunition with the countries in which the control of this traffic is necessary in the common interest; (e) will make provision to secure and maintain freedom of communication and of transit and equitable treatment for the commerce of all members of the League. In this connection the special necessities of the regions devastated during the war of 1914-18 shall be in mind; (f) will endeavor to take steps in matters of international concern for the prevention and control of disease.

[This replaces the original Article XX, and embodies parts of the original Articles XVIII and XXI. It elim-

inates a specific provision formerly made for a bureau of labor and adds the clauses (b) (c) and (f) respectively providing for the just treatment of aborigines, prevention of the white slave traffic and the traffic in opium, and looking toward progress in international prevention and control of disease.]

ARTICLE XXIV.

There shall be placed under the direction of the League all international bureaus already established by general treaties if the parties to such treaties consent. All such international bureaus and all commissions for the regulation of matters of international interest hereafter constituted shall be placed under the direction of the League.

In all matters of international interest which are regulated by general conventions, but which are not placed under the control of international bureaus or commissions, the Secretariat of the League shall, subject to the consent of the Council and if desired by the parties, collect and distribute all relevant information and shall render any other assistance which may be necessary or desirable.

The Council may include as part of the expenses of the Secretariat the expenses of any bureau or commission which is placed under the direction of the League.

[Same as Article XXII in the original, with the matter after the first two sentences added.]

ARTICLE XXV.

The members of the League agree to encourage and promote the establishment and co-operation of duly authorized voluntary national Red Cross organizations having as purposes the improvement of health, the prevention of disease, and the mitigation of suffering throughout the world.

[Entirely new.]

ARTICLE XXVI.

Amendments to this covenant will take effect when ratified by the members of the League whose representatives compose the Council and by a majority of the members of the League whose representatives compose the Assembly.

No such amendment shall bind any member of the League which signifies its dissent therefrom, but in that case it shall cease to be a member of the League.

[Same as the original, except that a majority of the League instead of three-fourths is required for ratification of amendments, although it does not change the requirement in that matter with regard to the vote in the Council. The second paragraph is also new, and was added at the request of the Brazilian delegation, in order to avoid certain constitutional difficulties. It permits any member of the League to dissent from an amendment, the effect of such dissent being withdrawal from the League.]

ANNEX TO THE COVENANT

I. Original members of the League of Nations.

Signatories of the Treaty of Peace:

United States of America, Belgium, Bolivia, Brazil, British Empire, Canada, Australia, South Africa, New Zealand, India, China, Cuba, Czechoslovakia, Ecuador, France, Greece, Guatemala, Haiti, Hedjaz, Honduras, Italy, Japan, Liberia, Nicaragua, Panama, Peru, Poland, Portugal, Rumania, Serbia, Siam, Uruguay.

States invited to accede to the covenant:

Argentine Republic, Chile, Colombia, Denmark, Netherlands, Norway, Paraguay, Persia, Salvador, Spain, Sweden, Switzerland, Venezuela.

II. First Secretary General of the League of Nations: [Sir Eric Drummond.]

[The annex, also a later addition, was not published with the original draft of the covenant.]

The Jones Process for Manganese Ores

The aim of the Jones process is to effect by metallurgical means a separation and consequent concentration of the manganese in ores in which the association of the manganese with iron is so intimate that ordinary methods of gravity or magnetic separation are out of the question. The process consists of two stages. In the first, called low-temperature reduction stage, two products are made, namely (a) metallic iron, suitable for direct use in the manufacture of steel, and (b) slag. Most of the manganese is concentrated in the slag. Separation of these two products is accomplished by grinding the sinter resulting from the low-temperature treatment of the ore, and thereupon extracting the magnetic iron pellets by means of magnetic separation apparatus, producing thereby a high-grade magnetic iron concentrate, and a non-metallic manganiferous sinter. Separation is also accomplished by pouring the material under treatment in a liquid condition and recovering the iron metal in the form of a button. This last method of separation was developed at the Minneapolis experiment station of the Bureau of Mines. Its advantages are obvious, and should the process become a commercial success, this method of separation would doubtless be used. The second stage, which may be called the high-temperature stage, involves the smelting of the manganiferous slag or sinter derived from the first stage, to produce a manganese alloy.

The results of tests carried out by the U. S. Bureau of Mines indicate that by the Jones process concentration of manganese in the finely disseminated manganiferous iron ores is metallurgically possible. The metal produced in the low-temperature reduction is suitable for conversion into steel by any basic steel process. It could not be used as a foundry metal. Whether the low-temperature reduction could be modified to yield a foundry metal would require further experiments. By a suitable regulation of temperature and by the use of iron ore in the place of manganiferous ores, it is possible to make a foundry metal. About 72% of the manganese in the ore appears in the alloy.—Peter Christianson and W. H. Hunter.

REVIEW OF MINING

COLORADO

STATE MINES DEVELOPMENT ASSOCIATION.—SILVERTON, PARADOX VALLEY, RICO, TELLURIDE, OURAY, LA PLATA.

Mine-owners in south-western Colorado favor the newly organized State Mines Development Association. The objects of the association are to increase public interest and confidence in mining operations and to develop the mining resources of the State more intensively. The State will be mapped out into 10 districts, each district to be supervised by a local board of directors composed of shareholders of the association. The local board will examine any prospects brought to its attention, recommending favorable prospects for development. They will also have the management of any association projects within their district. The various operations of the association will be determined by the parent company solely upon respective merits, regardless of the district location, thus eliminating favoritism. The plan of capitalization is similar to that of insurance companies, 10-year contracts being issued to shareholders, upon which an annual assessment is paid similar to the premium on insurance policies. These contracts call for a participation in the association's profits from all sources up to 90%, the remaining 10% going to the capitalization and maintenance of the parent company. Local branches have been organized at Ouray and Silverton, and it is probable that other towns will form branches.

SILVERTON.—Shipments from this district are light, but extensive development work continues. The rising price of copper is having a stimulating effect on the operations of the smaller producers, whose output is mainly copper ores; it will especially benefit Red Mountain, as soon as the Silverton railway is again open. At present the tracks are out at numerous points, and extensive repairs are required before the ore can be pulled. Large tonnages are ready for shipment, as has been noted at an earlier date.

The Sunnyside M. & M. Co. has a force of men on the ground starting construction work on the new buildings. The Gold King Extension Mining Co. is now running the mill. The preliminary tests are encouraging, and continuous milling is to be expected. Mr. Kinney, who has been severely ill, is recovering and will soon resume the direction of the work. The Columbus mine, near Animas Forks, was obliged to discontinue operations for a short period while repairs were made to the compressor. The Rouville and the Little Anna properties will be operated under lease by Fattor and Job. The American Smelting

& Refining Co. has leased the Silver Lake mine to Giono & Co., who have started operations. The Silver Ledge will resume operations. A fire at the Vernon mine, near Red Mountain, destroyed all the outside workings except the bunk-house and office-buildings, causing a loss of \$100,000. The Summit Copper M. & M. Co. has resumed operations.

The Barstow mine will probably be worked on a larger scale than for years, as the orebodies recently opened up in virgin ground are promising, there being a large tonnage of high-grade gold-milling ore. The recent strike that was made by breaking open an envelope of kaolin has broken all records for richness of ore found in this mine. The Radiant Mining Co., operating in the vicinity of Burro Bridge, reports a good showing of ore on the December vein. Development on the Sioux group of claims is now under way. The Gold Bird group has a good showing of galena and copper in a newly opened vein. The North Star M. & M. Co. has resumed operations. The Highland Mary Leasing Co. is shipping steadily.

The Needle mountains, about 20 miles south of Silverton, are receiving attention, and new prospects are being opened. The most important is the Black Horse, near Needleton; this has extensive bodies of high-grade zinc-lead ore. The property is some distance from the railroad, so that packing is necessary, but as soon as increased shipments warrant the expense a wagon-road will be built.

PARADOX VALLEY.—The Radium Mines Co. is developing its holdings in the Long Park district. The Carnotite Reduction Co. intends to build a large mill for the treatment of carnotite ore. The site of the plant has not been determined upon, but it will be either in the Paradox Valley or at Grand Junction. Shortage of labor continues.

RICO.—Scarcity of labor has caused the curtailment of many operations. The Marmatite M. & M. Co. continue to mine low-grade ore, and is shipping at the rate of two cars daily. An assay-office has recently been added. The Rico Argentine Mining Co. is about to resume shipping. The Resolute Mining Co. continues to mine high-grade silver ore. Operations have been resumed upon the Expectation group, and a large body of high-grade copper ore has been opened up. In anticipation of a busy season a boarding and bunk-house will be built. The Big Four company will resume operations with the driving of a new adit into Telescope mountain. In order to facilitate the placing of miners, a clearing-house for

miners has been established, so that the needs of the various companies can be listed.

TELLURIDE.—Shipments continue light, but development work is increasing. Acute labor shortage exists, 250 men being required for all the projects planned. The Belmont-Wagner Mining Co. is now operating the Alta mill successfully, and high-grade concentrate is being shipped at the rate of a car every other day. The Inamo & Perino Leasing Co. is milling and shipping steadily.

OURAY.—Gannon & Hall are operating the Rose lode under lease, the first car of the season having been shipped during the last week in June. The holdings of the Wanakah Mining Co. are to be sold at auction to satisfy a judgment. The holdings consist of the following claims: the Sawdoff Lode, King Lode, Lilly Clay Lode, U. S. Gold Lode, and Bluff Lode.

LA PLATA.—Mining activity in Cave basin is reviving. The Excelsior mine has a good showing of silver ore, and has resumed shipments. Transportation difficulties need to be overcome, as the ore must be packed for a distance of four miles to reach the wagon-road, and from that point hauled 25 miles to the smelter.

MICHIGAN

CALUMET & HECLA, SENECA, QUINCY, ISLE ROYALE.

HOUGHTON.—Calumet & Hecla's loss by fire of the Hancock & Pewabic engine-house, with its contained hoisting plants, did not interfere seriously with ore production. The plant served four shafts on the conglomerate: No. 7, 8, 9, and 10, all in the South Hecla branch of the main Calumet & Hecla mine. Within 12 hours after the fire one of the shafts was connected with an auxiliary hoist and within 24 hours all shafts were producing ore and hoisting it at the normal rate. These four shafts are included in the program for greater development with depth that is planned for the Calumet & Hecla conglomerate lode. The haulage level to connect the Red Jacket shaft with the territory served by shafts 6 and 7 Hecla and 9 and 10 South Hecla has been driven 3700 ft. This is being driven in the amygdaloid 180 ft. under the conglomerate, and when finished will be 7800 ft. long. Connection with the conglomerate will be established by means of underground shafts. Power tramming will be used.

The Seneca shaft is below 1800 ft. and sinking continues. Driving has commenced on the first level. The cross-cut showed well-mineralized Kearsarge amygdaloid. Additional surveys of possible mill-sites have been made on that part of the Lake Superior shore line held under option. Quincy's new hoist for No. 2 plant has begun to arrive and will be installed as rapidly as possible. It is designed to hoist from a depth of 14,000 ft., as against an 8200-ft. maximum for the present plant. Isle Royale production now is limited to shafts 4, 5, and 7. The June ore tonnage was approximately 42,000 and averaged 18 lb. of copper per ton. Five drill parties are working in newer openings, all in ground which is reported to average 20 lb. over a stoping width. North of

the shaft the drifts over to No. 6 are holed through down to and including the seventh level, but on the south side the drifts from the surface down to the sixth were stopped at 1200 ft., as that is the point midway to the

MAP OF MICHIGAN COPPER DISTRICT

location of the proposed No. 8 shaft. Work on this has not yet been started.

NEVADA

GOLDFIELD, AUSTIN, PIONEER, TONOPAH, KENNEDY.

GOLDFIELD.—Under supervision of F. D. Bradley, of San Francisco, the Goldfield Consolidated mill is being repaired and improved and will go into commission the first week of August. It is scheduled to treat 1200 tons of ore per day from the Red Top mine and the north section of the Florence. The Red Top product is to be hoisted through the Laguna shaft. The Combination mine is being placed in shape for early production by way of the Fraction shaft. The Goldfield Development Co. estimates, including ore exposed in the north half of the Florence mine, a minimum of 2,150,000 tons of ore available for treatment.

A new silver-lead district 10 miles south of Goldfield is attracting attention. The district formerly was known as Casey's Flats. The Merrill Silver-Lead company, owning 125 acres, has been organized, and Harry B. Ruhl, interested in a number of companies at Divide, is forming a corporation to develop claims in the new dis-

trict. The principal vein in the Merrill claims has a maximum width of six feet. Assays from 3.84 to 7.44 oz. silver have been reported. The ore also contains considerable lead and a small quantity of gold. The principal formation in the district is a dark gray crystalline limestone.

AUSTIN.—The face of the Hiawatha tunnel of the Austin Nevada Consolidated is in ore, and opening of the vein-system has begun. H. G. Richardson, the manager, reports financing of important work is proceeding satisfactorily and that the directors plan to erect the first unit of a large mill in the fall. Emmet D. Boyle, Governor of Nevada, has acquired a group of claims adjoining the Austin Nevada Consolidated and started sinking on a promising vein showing high-grade silver. The Austin Dakota Co. is reported to have opened extensive reserves of ore carrying silver. It is planned to erect a mill in the near future. C. J. Babcock, Dean of the North Dakota School of Mines, is consulting engineer, and C. F. Littrell is manager.

PIONEER.—J. B. Kendall, president of the Consolidated Mayflower, has confirmed report of a discovery of four feet of \$100 gold ore on the 200-ft. level. The strike was made in a raise which had advanced 14 ft. on \$40 ore. The cross-cut has struck the Mayflower vein on the 500-ft. level, showing seven feet of \$15 ore. The directors have practically decided on immediate construction of a new mill, and definite action will probably be taken at the annual stockholders meeting, to be held at Pioneer on July 21.

TONOPAH.—Tonopah Extension Co. has begun diamond-drilling of the south end of Red Rock claim, adjoining the California claim of the West End company. The work will determine if the Ohio vein continues into Tonopah Extension territory. On the 1680-ft. level of the Victor shaft a station has been cut on the north side and a 500-gal. turbine pump installed. Cross-cutting is progressing from the 1700-ft. level to reach the Murray vein.

KENNEDY.—A. A. Smith and Frank Warning have uncovered a promising vein of silver-gold ore at surface and traced the orebody for 3000 ft. It ranges from three to four feet wide and has been followed to a depth of 15 ft. The ore is said to be milling grade, mingled with seams of rich quartz. Extension of the vein has been found on the Silver Butte group, owned by Lee Campbell and William Sarden.

ONTARIO

KIRKLAND LAKE, PORCUPINE, COBALT.

Forest fires swept large areas of Northern Ontario last week, and the mines of the Porcupine camp were for some time in danger. Some damage was done at the Dome Lake mine and the Hollinger and other properties in the Timmins area were seriously threatened, but were saved by a timely rainstorm. The most serious losses sustained were at Boston Creek, where the mining plants of the Patricia and Cotter were burned. The loss on the mill of the Patricia is estimated at about \$75,000.

KIRKLAND LAKE.—Operations at the leading mines are

at a standstill owing to the miners' strike, which is still unsettled. The majority of the strikers have left the camp, a number of them having gone out as prospectors or found employment in doing assessment work on claims. —The Ontario Kirkland will install a 100-ton mill. A vein stated to show \$28 ore, over a width of 5 ft., has been opened up on the 300-ft. level. The Greene-Kirkland company, which owns a group of claims formerly belonging to the Lucky Cross, will install a small mining plant and carry on a comprehensive program of exploration. —The output of the Lake Shore during May amounted to \$42,136 from the treatment of 1750 tons of ore, running \$24.08 per ton. —The Kirkland Lake has 500 tons of ore in the mine bins and a surface dump of 8000 tons with stopes full at the 300-ft. level. At the 600-ft. level a 15-ft. ore face is showing with ore stated to average \$55 per ton. Running parallel is another 3-ft. orebody averaging \$28 per ton. Surface work on the Young-Duncan east of the Tough-Oakes shows two good veins 3 and 5 ft. wide, which are believed to be an extension of the Tough-Oakes vein system. —At the Kirkland Combine, camps are being built and exploration work undertaken.

PORCUPINE.—The Porcupine miners recently asked the operators for an increase of 50c. per day in wages all around. It is hardly probable that the request will be granted, but the leading mines are preparing to meet the views of their employees by reducing the cost of living, by opening company stores, to a point that would be more advantageous to them than the granting of the increase asked for. The Dome Mines, it is stated, has already by this means cut down living expenses some 18% below what they were at the beginning of the year. The Hollinger is making plans in the same direction, by which it is hoped to bring about a reduction of 25%. The miners are reported to be showing a conciliatory spirit ready to co-operate with the company.

The Dome Mines is said to be producing at the rate of approximately \$120,000 monthly, or at about half capacity. An average of about 20,000 tons of ore is treated every 30 days, indicating that mill-heads are running somewhat higher than the average grade of the ore. Profits are conservatively figured at about \$2 per ton. —The Imperial has let contracts for several hundred feet of driving and cross-cutting. —The McIntyre is cutting a station in the main shaft at the 1200-ft. level. Ore from the 1135-ft. level is being mined and milled. The shaft has been sunk 175 ft. deeper and a haulage level established. The mill is reported running at capacity on ore averaging \$10.

COBALT.—The threatened strike of miners still hangs fire, action having been deferred pending further negotiations with the mine owners through the Labor Department of the Canadian government. Meanwhile the miners are receiving an additional bonus of 25c. per day for the month of June as a result of the quotations for silver having averaged over \$1.10 per ounce during the month. This brings the total bonus paid in addition to the regular wage up to \$1.50 per day.

The Foster has discovered another vein at the 40-ft. level. It is reported to be high-grade.—The Oxford-Cobalt, which has two claims in the Gillies Limit, directly south of the Kerr Lake group of mines, has appointed Prof. J. W. Russell, late of Woodstock College, as manager.—The Adanac has made its first shipment of a car of high-grade ore and concentrate.—At the Provincial three veins have been encountered, which though low grade show considerable silver in the wall-rock. On the Temiskaming a 2-in. ore-shoot carrying some high-grade has been encountered at a depth of 575 ft. The Mohawk, on the west side of Mud lake, has started work.—The Kerr Lake produced 105,582 oz. of silver during May, compared with 104,477 in April.

BRITISH COLUMBIA

GENERAL NEWS OF THE PROVINCE.

Rails have been laid on the extension of the North Fork branch of the Kettle Valley Railroad to the Rock Candy fluorspar mine, belonging to the Consolidated M. & S. Co. The siding to the Humming Bird mine also has been completed.

The work at the Big Missouri mine, Salmon River district, recently bonded to Sir Donald Mann, has been placed in charge of William Noble, who has a number of men on development work.—The Spider group, Salmon River district, has been optioned to R. W. Martin, of Seattle. Rich ore is said to have been struck recently.

Diamond drilling on the Snowstorm property, Highland valley, has found a body of high-grade copper at a depth of 600 ft. Surface ore sent to the smelter some time ago gave returns of 30% and 23% copper, respectively.

The Cunningham mill, on the Alamo claims, Slocan district, has been re-started.

Miners at the Cork Province mine, Ainsworth district, are out because the mine refused to pay the wage-scale in force at the Sandon camp. The ore is low grade, and mine-owners say they cannot pay Sandon wages and work at a profit.—The Silversmith mine, Sandon, recently shipped 100 tons of concentrate to the smelter, and received a return of 90 oz. silver per ton. In future it is expected that the mine will be shipping 300 tons of silver-lead concentrate per month.

After a considerable period during which nothing but development has been done, the Silver Standard, at New Hazelton, shipped two 44-ton cars of silver-zinc concentrate. The mine and mill are in full operation once again, and in future will be shipping about two cars of zinc and one car of lead concentrate per month. The concentrates are being sent to the Selby smelter.

A combined San Francisco and Seattle syndicate has bonded the Carmi mine, in the Boundary-Yale district. A new mill and compressor plant are to be erected.

GRAND FORKS.—The Granby Consolidated Mining, Smelting & Power Co. has discontinued operations at its Grand Forks smelter and Phoenix mine, and it is believed that the close down is permanent. Although the immediate cause of the cessation of work is lack of coke

owing to the strike at the Fernie coal-fields, it is felt that this trouble only hastened what was inevitable. The company is offering all employees at Grand Forks and Phoenix free transportation to Anyox and positions with the company at that place. Among the Phoenix miners and business men, however, there is a persistent feeling that Phoenix will rise again from its Granby ashes. It is pointed out that the machinery is not being removed, the only exception being that of a few ore-crushers, and that although the Great Northern Railway will pull up its tracks, the C. P. R. will not do so. Attention in this connection is directed to the report of the Granby company of last June, which states that there was then 3,274,966 tons of ore in the Phoenix mine. Since that time it is estimated that about 150,000 tons has been mined. On that basis, therefore, there are about 3,000,000 tons still left. This, with the possibility of new development, inclines those with confidence in the camp to the belief that the Consolidated Mining & Smelting Company of Canada is likely to step into the breach and to continue mining operations in the district.

MEXICO

EXPORTS THROUGH AGUA PRIETA.—GENERAL NEWS.

SONORA.—Exports of ore through the port of Agua Prieta into the United States during the month of June showed a slight decrease from May. The total value was \$1,135,600, Mexican gold, from a total of 161 cars or 6296 tons of ore. Nacozari led with 5640 tons, which represented several companies, but chiefly the output of the Moctezuma Copper Co.; El Tigre was second with 450 tons; other shippers were San Nicolas 33 tons, San Pablo 48 tons, San Pedro 16 tons, La Cruz 38 tons, Nueva Amistad 10 tons, Tarasca 21 tons, Tres Piedras 10 tons, and La Roy 30 tons.

The Babicanora mine is being opened up on three levels, exposing some good ore. A 25-ton stamp-mill is making a high-grade concentrate of silver and gold, and a zinc concentrate which is shipped to Nacozari and marketed. Sixty men are employed. Las Chispas, adjoining the Babicanora, is operating steadily, shipping high-grade ore and flotation concentrate from its mill. The Tepecate mine, south of the Babicanora, is being opened by Hosier Brothers & Co., of Kansas City, Missouri. The company is well financed and is doing consistent work reopening the old workings in this rich silver-lead mine. Twenty-five men are employed. New machinery is being set up. Recent developments underground are reported to be of encouraging nature. The Espiritu Santo, adjoining Las Chispas, will start operations soon. At present it is being examined for the owners by John A. Rice. It is controlled by a Cananea company composed of R. L. Hawes, the estate of Harry Kirk, and others. It is reported to have rich bodies of silver ore. The San Pascual property continues operating in a modest way, developing its orebodies by means of shafts and tunnels. It is in charge of Martin Hickenson. The San Nicolas, operated by Douglas capital, began operation of its new 50-ton flotation mill early in July.

ARIZONA

Globe.—The Miami Mining & Milling Co. has purchased the complete 250-ton milling plant of the Arizona Butte company from W. J. Porter of Globe. The company is now installing an initial 50-ton plant, the capacity of which is to be increased from time to time. The new compressor plant is expected to be in operation within a week.

Kingman.—It is reported that H. M. Crowther has satisfactorily financed the Arizona Butte tunnel project at Stockton Hill. Sufficient money has been raised to drive an 11,000-ft. tunnel. It is expected that this tunnel will open ore at depth under many old mines and at the same time open up new orebodies. A contract has been let to W. D. Grannis of Los Angeles to drive an adit drift on the Cedar Grannis silver vein near the Leviathan mine. This drift is now in 160 feet.

Nogales.—The Lyman Syndicate of Jerome has secured a 25 year lease from Billy Powers on the Blue Nose property, which has not been worked since 1882. A large hoist, compressor, and other machinery have recently been installed and sinking is to commence immediately.

Oatman.—It is reported that the orebody on the 1400-ft. level of the United Eastern Mining Co. has been cut and that the values are the same as those on the 660-ft. level. The shaft has lately been sunk from the 1150-ft. level to the 1400-ft. level.

Prescott.—The Silver Belt mine has made its first shipment of silver ore to El Paso. The ore is estimated to run 300 oz. of silver per ton and comes from the 300-ft. level. Driving on this level is to be continued. A pumping plant has been installed and other necessary machinery is to be ordered.

Tucson.—The Ohio Arizona Copper Co. has taken over the Silver Hill property in the Silver Bell mountains. This property has been worked spasmodically for years, being the old Nat Faison patented claims. The work, however, has never been carried on at any depth. A 400-ft. shaft is to be sunk immediately. The property is 15 miles from the railroad and smelter at Sasco.

CALIFORNIA

Allegany.—An electric hoist has been installed in the main adit of the Mariposa, 600 ft. from the portal. Shaft-sinking to a depth of 500 ft. on the lode will be immediately carried forward. Ore of excellent milling grade is reputed in the tunnel workings. Sinking will commence shortly at the El Dorado group to seek three veins which have given fair results in the tunnel workings.

Carson Hill.—The Morgan mine, operated by the Carson Hill company, is producing from the 200, 300, 500, and 675-ft. levels and keeping the mill running at capacity on ore stated to average \$12 to \$13. Monthly earnings approximate \$60,000, with the mill treating about 4500 tons. Total operating costs average less than \$5. Before the end of July stopping will start on the 860-ft. level.

Downieville.—A new tunnel, which will be 700 ft. long, is being driven at the White Bear gravel mine. It is planned to intersect the channel 1500 ft. below the main lateral,

from which the miners were recently driven by a heavy water flow. John Costa is superintendent.

Engelmine.—Prospecting outlying ground with diamond-drills has been started by the Engels Copper company.

Grass Valley.—There have been rumors of a new strike, due to dissatisfaction with some of the conditions brought about by the agreement recently entered into between the Mine Workers' Protective League and the operators, which does not seem to work out in practice as anticipated by the miners. All the mines are in operation except the Union Hill, which is stated to have closed down permanently. The State Highway Mining company, composed of local residents, is reputed to have uncovered at a depth of 50 ft. a vein assaying \$50 over seven inches. The shaft will be sunk 50 ft. deeper and driving commenced.

Ingot.—The Afterthought Copper Co. officially announces that the reverberatory furnace and flotation plant will go into commission before July ends. Fifty to sixty men will be added to the working crew and underground operations increased.

Kennett.—The Mammoth Copper Co. has asked the supervisors to reduce its assessment for this year from \$1,963,985 to \$619,164—a reduction of \$1,344,821. The company claims this cut is fair because of the shut-down of its smelter and the stopping of production, and heavy depreciation. It also claims its assessment was out of reason even in good times, its assessed valuation having been increased \$1,100,000 in the two years of 1916 and 1917.

Nevada County.—Ray C. Rassen, Commissioner, appointed by the Superior Court of Nevada county, has authorized the sale of all the holdings of the Mountaineer Mines Consolidated, to satisfy a judgment obtained July 2 last by Peter Bender of Santa Clara county for over \$151,000. The property involved consists of some 33 lots and patented quartz claims, rights of way, pipe-lines, and surface improvements. The property, which has had a varied existence as a producer, is close to town and adjoins the Champion holdings on the east and south.

Placerville.—Following examinations by E. A. Gabriel and W. E. Davis of Modesto, large owners, arrangements are being made to re-open the Landecker, formerly a producer of gold-quartz and gravel. Richard Reynolds is superintendent. John E. Patterson, Long Beach, has purchased the Blackburn gravel mine near Fairplay, which adjoins the Rocky Bar placer group on the middle fork of the Cosumnes river. Development of the channel is to start immediately.

Sloat.—Feather River Gold Mines Co. has concluded an excellent placer season and is preparing to improve the dam and develop new ground. Henry Halstead is in charge.

COLORADO

Cripple Creek.—Contractors are sinking a shaft on the Dexter for the leasing firm of Anderson & Benkelman. Lessees of the Gold Sovereign Mining & Tunnel Co. are mining ore from a vein four feet wide on the 9th level. A carload of ore from the Maggie mine of the Cresson Consolidated company brought settlement at the rate of \$83.60 per ton. The ore was mined by Duchesne and Kearns.

Twenty-seven sets of sub-lessees operating under the Owen-Roberts lease on the Strong mine at Victor are producing a car per day. It is planned to sink the shaft of the South Burns mine from its present depth of 1450 ft. to 1700 feet.

Fairplay.—The Mudsill Gold & Silver Mines Co., with offices in Denver, has taken over the properties along the London fault fissure known as the Sherwood, Camp Bird, and Kurt, and now owns approximately 300 acres on this fault. The claims named have produced in excess of \$100,000 from light development. John B. Stephens is president of the company.

Leadville.—An electric storm recently disabled the power-line and stopped the pumps at the Penrose mine. As the electric hoists were also stopped, the miners had to climb the ladders to escape. The Hibschiele sub-lease of the Down Town Mines company is producing a good grade of lead carbonate and iron flux, with prospects for increased production in the near future.

IDAHO

Mullan.—The National Copper Mining Co. earned \$25,000 net in June, compared to an earning of \$20,000 for the month of May. The mine is opened for 1000 ft. in depth on the pitch of the vein, with an 800-ft. perpendicular shaft.

George Craddock of De Borgia is operating a group of 10 claims situated in the De Borgia copper belt on the same vein system as the Monitor, Richmond, and St. Lawrence mines. Two adits are being driven. Present development amounts to more than 2000 ft. of adits, drifts, and cross-cuts, and there is a large tonnage of ore of a milling grade.

MINNESOTA

Cosby.—Capt. Gulgren and three miners were badly gassed last week by a fire in drift 48 of the Armour No. 2 mine.

MONTANA

Libby.—C. E. Lukens, president and manager of the Lukens-Hazel Mining Co. of Libby, Montana, will build a power-plant and concentrator on the property; it will be capable of milling 200 tons of ore per day and will cost about \$200,000.

Rimini.—The Gould placer mines located four miles above Rimini on the Try Again branch of the Ten-Mile have been sold to Charles Hewett of Butte for a group of Salt Lake investors. Work has already been started on a hydraulic plant.

Saltese.—The working force at the Tarbox mine has been cut to 12 men. Only four men are working underground.

NEVADA

Carson City.—The Carson Free Gold property is reported to have cut four feet of high-grade ore.

Tonopah.—The wet jack-hammer drilling contest held here on July 4 resulted in the following prize-winners:

First—Dan Boyd, 56-10/16 inches.

Second—George Lynch, 52-2/16 inches.

Third—Adam Ogi, 49-14/16 inches.

Fourth—Ed. Yender, 48-8/16 inches.

OREGON

Medford.—We have received a letter from A. E. Kellogg, of Gold Hill, entering a friendly protest against the statement appearing in this column in our issue of July 12, that the War Eagle mine carried 3½ to 4% mercury over a width of 5½ ft. Mr. Kellogg further states that he has recently inspected this property, and that he is moved to protest in the interest of the district, which can only be injured by such extravagant reports. We are glad to make this correction here.—News Editor.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Henry Hanson left on July 12 for Idaho for a professional trip which will take several weeks.

Maurice D. Leche was in San Francisco last week on his return from Washington to Seattle.

C. Legrand, consulting engineer to the Phelps Dodge Corporation, has gone from Douglas to New York.

Cecil A. Gorelanton, Captain in the Engineer Corps, U. S. Army, sails for Shanghai on July 29 on his way to North China.

A. W. Geiger, Captain in the Engineer Corps of the U. S. Army, has returned to San Francisco after a year's service at the front in France.

J. Volney Lewis will spend several weeks in professional work in the Las Animas district of New Mexico. His address will be Hillsboro.

Lionel Lindsay, at one time on the staff of the M. & S. P., voyaged recently by aeroplane from Paris to London, 220 miles, in 2 hours 6 minutes.

J. C. E. Baker of Great Falls, and **C. L. Tout** of Butte, have recently taken a working bond and lease on the Pilgrim group of mining claims near Bozeman.

Charles E. Prior, Captain U. S. Army, has returned from France and is proceeding to Pachuca, Mexico, as chief engineer to the Santa Gertrudis company.

R. C. Gemmell, general manager for the Utah Copper Co., will become assistant managing director of the allied Jackling companies on August 1. **Louis S. Cates**, at present general manager for the Ray Consolidated Copper Co., will become assistant general manager for the Utah Copper Co. **C. D. Moffat** has been appointed metallurgical engineer to the Jackling companies.

The San Francisco section of the A. I. M. E. will meet at the Engineers' Club on Tuesday next, the 22nd inst., in order to hear an address from Mr. Philip N. Moore on 'The Engineering Council and the proposed Federal Department of Public Works'. The dinner will be at 6:30 as usual; the meeting beginning at 7:45 p.m.

William Tovote was killed recently by Yaqui Indians in Chihuahua, Mexico, while in the employ of the American Smelting & Refining Co. He was born in 1872 at Linden, in Germany, and graduated from the Mining Academy of Freiberg in 1901. After a short stay in Serbia, he came to the United States in 1905, and became honorably known as a mining geologist, contributing several articles to this paper. For several years he lived at Tucson, Arizona, and latterly at Venice, California.

The United States Civil Service Commission announces that the examinations listed below will be held in San Francisco at an early date.

Assistant in tobacco investigations (male), \$1200-\$1800 per year; vacancies in the Bureau of Plant Industry, Department of Agriculture, for duty in the field.

Assistant instructor, Motor Transport Training School (male), \$1500-2400 per year.

Stationary fireman (male), \$1000 per year; vacancy in Quartermaster Service, Presidio of San Francisco.

Application blanks and further information relative to these examinations may be obtained from the secretary, Twelfth Civil Service District, room 241, Post-Office Bldg., San Francisco, California.

THE METAL MARKET

METAL PRICES

San Francisco, July 15

| Platinum, 10% iridium, per ounce..... | \$115 |
| Quicksilver, per flask of 75 lb..... | \$100 |
| Spelter, cents per pound..... | 9.50 |
| Zinc-dust, cents per pound..... | 10.00—12.50 |

EASTERN METAL MARKET

(By wire from New York)

July 15.—Copper is active and advancing. Lead is in better demand. Spelter is active and higher.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01 1/4 on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

It has been announced that the U. S. Treasury has waived the restrictions contained in the agreement between the United States and Great Britain for the purchase here of 200,000,000 oz. of silver, which is taken to mean that the price of this metal may now move to still greater heights. At first the agreement provided for a price of \$1 per ounce, then it went to \$1.01 1/4, and only recently silver sold as high as \$1.14.

There is slight chance for the better in the China market, the rates having advanced both in Shanghai and Hongkong because of the movement in exports. As was expected, the movement of gold to China has not been of much consequence. There is no improvement in the Indian situation. The drain on the Treasury is still going on, and the Government is obliged to maintain coinage at the old rate. If this situation continues, the silver market will be very firm.

ENGLAND'S STOCKS OF METAL

Boston—On the first of the current month, the British government had on hand the following stocks of non-ferrous metals (in long tons): Copper, 44,398 tons; spelter, ordinary, 26,059, fine, 13,356; lead, 121,135; antimony, 4388; nickel, 2452; aluminum, 10,662.

In pounds this means that England on July 1 had on hand in surplus stocks 99,277,400 lb. of copper, compared with 107,502,080 lb. on June 1, a decline of about 8,250,000 lb. This is indicative of the fact that a considerable tonnage of copper is being melted at the present time. During June she imported a substantial tonnage of copper bars yet at the same time she was busy enough to eat into her surplus.

In lead, however, the story is different. Great Britain on the first of this month had on hand 271,342,000 lb. of lead, 3,000,000 lb. more than last month and compared with December 19, 1918, the date all restrictions on British metal were removed, an increase of over 160,000,000 pounds.

The nation's supply of zinc also expanded last month. On July 1, 88,280,600 lb. were held by the government, or about 2,300,000 lb. more than in June. There has not as yet appeared any substantial export buying in the American zinc market.

The following (in pounds) pictures present holdings of England compared with previous months, and also compared with stocks on December 19, 1918:

| | July 1 | June 1 | May 1 | Dec. 1918 |
|----------------|-------------|-------------|-------------|-------------|
| Copper | 99,277,400 | 107,502,080 | 114,531,200 | 61,667,200 |
| Lead | 271,342,000 | 268,591,680 | 244,186,880 | 110,008,640 |
| Spelter | 88,280,600 | 86,078,720 | 76,090,560 | 56,698,880 |
| Aluminum | 23,874,080 | 24,458,560 | 25,854,080 | 22,881,610 |
| Nickel | 5,482,480 | 7,956,480 | 5,750,080 | |
| Antimony | 9,784,320 | 10,080,000 | 9,992,640 | |

From the above it would appear that England may be as active a buyer of American copper in the not distant future as will the Teutonic countries when proper credit has been established for them. Certainly it begins to appear as though the world were not as glutted with metal as 80 days ago.

Eastern Metal Market

New York, July 9.

The holidays Friday and Saturday, July 4 and 5, caused a lull in the markets, but the tone this week is strong and demand is quickening.

Copper has continued to advance on heavier demand, both foreign and domestic.

The tin market has been quiet but steady.

Very little has been done in lead but the tone is strong and prices are firm.

Demand for zinc has decidedly improved and prices are advancing.

Antimony is unchanged.

IRON AND STEEL

There is no marked change in the situation, but when general conditions are summed up the conclusion is that the market is slowly forging ahead to better things. Many Northern makers of pig-iron are now comfortably booked with orders for third quarter delivery, some have sold well into the fourth, and a little business for 1920 delivery has been closed. Alabama furnaces expect to benefit from the sold-up condition of their Northern competitors. Southern prices for pig-iron are slightly stronger, although in Pennsylvania concessions are still being made. Inquiries are coming from England, Sweden, and Holland. In finished steel products, wire and wire products and tubular goods are most active, with structural material making a good showing in the central West. The steel industry in general is adhering to about two-thirds of capacity. Several makers of bolts and nuts have advanced their quotations, having put bolts up 5%, nuts, except semi-finished, up \$3, and rivets up 10%. Export inquiry is more encouraging, especially that coming from the East. Japan is in the market for both rails and plates in round tonnages. The Railroad Administration is showing no disposition to buy, a policy which is authoritatively said to be hurting the railroads more than the steel mills. Confidence in the stability of present prices is growing.

COPPER

Twenty cent copper is apparently nearer than was predicted a short time ago. July delivery of electrolytic copper is hard to get under 19.75c., New York, with some producers sold out for this position. Others are quoting as high as 20c. For August not less than 20c. can be done with probably 20.25c. a fair valuation. For July-August delivery 20c., New York, seems to be general today. We quote the market as 19.75 to 20c. for July delivery for electrolytic copper with Lake firm at 20 to 20.25c., New York. Inquiry is reported as very brisk with sales good both for domestic and foreign account, Japan being still a buyer. Consumers seem to be of the opinion that a rising market is at hand and are taking more interest. The market grows stronger daily.

TIN

An absolutely free market, except perhaps so far as the necessity for certain import licenses is concerned, seems assured now after September 1. An announcement of July 3, effective July 1, is to the effect that import restrictions have been removed as of September 1 on pig-iron and metal alloys containing tin when imported from countries other than countries of origin. It is expected that soon even import licenses to bring in tin will be no longer necessary. Because of the holidays on Friday and Saturday the market has been quiet; there has been very little demand. Straits tin from stocks is unchanged at 70.50c., New York. The

London market has been strong the last few days and it has had its effect here so that Straits tin from England is quoted at 53c. per lb. with 52c. asked for this grade from the Far East. Lamb and Flagg tin for importation is held at 52c. American 99% metal is quoted at 67 to 68 cents.

LEAD

This market is very quiet but firm. There has been a fair amount of inquiry but it has not resulted in any large amount of business despite reports that the demand has been big. Quotations are unchanged at 5.40c., New York, or 5.15c., St. Louis, these levels obtaining in both the outside market and as the bid of the leading interest. An unconfirmed report is to the effect that the American Smelting & Refining Co. has sold September-October delivery at 5.60c., New York.

ZINC

The inquiry for zinc has broadened and in the last two or three years the tone of the market has become considerably stronger. Prime Western for early July delivery is not quoted and sold at 7.15 to 7.20c., St. Louis, or 7.50 to 7.55c., New York, with not less than 7.20c., St. Louis, asked for August. The principal cause of the strength is said to be demand for export as well as a quickening demand on the part of domestic consumers.

ANTIMONY

No change is reported and prices are nominal at 8.37½ to 8.50c., New York, duty paid.

ALUMINUM

No. 1 virgin metal, 98 to 99% pure, is obtainable at 33c., New York, for wholesale lots for early delivery.

ORES

Manganese: There is a little more inquiry, but buyers and sellers cannot get together on price, which springs partly from the inability of the sellers to obtain cheap freight rates.

Manganese-Iron Alloys: Ferro-manganese is in light demand following the recent flurry of buying. Although American producers are quite generally quoting \$125, delivered, it is believed that \$115 and possibly \$110 would not be refused in some directions. The British price is \$115, seaboard. Spiegeleisen is unchanged at \$30 to \$35, furnace.

Molybdenum: The market is dull, with prices unchanged at 75 to 85c. per lb. of MoS₂ in 90% concentrate.

Tungsten: Despite the holiday considerable activity is reported, and there is additional inquiry for high-grade ore for home consumption which is expected to materialize soon. Chinese ore for spot and forward delivery has been sold around \$7 per unit. Business has been done in tungsten ores for shipment to Europe—the first in a long time.

Wire manufacturers are the best buyers of copper, and their efforts to obtain it simultaneously have been quite in line with plans to advance the market. The agencies and producing interests not members of the Copper Export Association have been coming more in competition with that organization and have been underselling the larger factors in the export market. The demands of the Scandinavian countries, which have been a growing factor in the export buying, have been chiefly for wire rods. Much, if not all, of this copper will eventually find its way into Germany, producers believe.

MINE EQUIPMENT FOR EVERY REQUIREMENT

HOLMAN Hoist

This stretcher bar hoist will handle from 500 to 1000 lbs. operating on but half the power required for a 3½-in. drill. You can take it into the most inaccessible places. You can use it for a thousand and one different purposes. And, when not in use, it can be placed out of the way.

It is practically all steel and is so especially sturdy that it rarely requires any attention. It is in use the world over like all Massco products.

MASSCO Cages and Skips

Made for every condition of mining. The Massco Double Deck Mine Cage is equipped with steel-plate doors and automatic chairs which are controlled by the station-man; and which automatically function when a level is reached. They are thoroughly fool-proof. Massco cages conform to the safety laws of all states. They are ready for immediate delivery in many types.

Massco Service the World Over makes it possible for you to get standard machine-tools, mining and metallurgical machinery, and assay or laboratory equipment at equitable prices no matter in what far-off corner of the world you may be. Three great warehouses are at your service. It will be worth your while to investigate fully.

Just write, mentioning class of equipment in which you are most interested.

SACKETT Sand Pump

This pump has met with marked success in the San Juan district of Colorado, where particularly hard quartz is encountered, replacing nearly all other types of pumps in that district.

It has an enclosed impeller; the shaft can be turned, thus giving double wear; adjustable to a larger pulley when desired; bearings and liner-joints efficiently protected from sand; all parts interchangeable. Get details concerning this pump.

THE MINE & SMELTER SUPPLY COMPANY

DENVER

SALT LAKE CITY

EL PASO

New York Office: 42 Broadway

AS our readers are aware, Mr. Frank H. Probert, Professor of Mining and Dean of the Mining College in the University of California, was one of a commission of three Americans sent early this year to investigate conditions in the devastated mining regions of northern France and southern Belgium. He had an opportunity to see the effects of German sabotage and to study the work of rehabilitation. In this issue we publish an interesting article on the subject, illustrated by some of his own beautiful photographs.

JUDGE BOURQUIN of the U. S. District Court of Montana on July 19 handed down his decree in the Minerals Separation v. Butte & Superior case in accordance with the recent judgment of the Supreme Court of the United States. The effect of this is to enjoin the mining company from further infringement of patent No. 835,120 and to impose payment for damages, yet to be determined by an accounting, for their trespass on the rights of Minerals Separation up to the end of 1916, after which time the mining company, by using more than 1% of oil per ton of ore, ceased to infringe.

STATISTICS of American copper production, as collected by Mr. B. S. Butler of the U. S. Geological Survey, will be found in this issue. It is interesting to note that the output during the last three years has been steady at a tremendous total, which is about 60% greater than the production before the War. Of this increase about 35% is estimated to be normal and 25% is due to the demands created by the War. Among the States of the Union the leading producer is Arizona, whose output of 769,500,000 pounds of copper reflects the splendid activities of the big mines of the disseminated chalcocite type, notably the Inspiration, Miami, Ray, and New Cornelia. The production of Arizona is more than double that made by any other State; it is about equal to the combined outputs of Michigan, Montana, and Utah.

IT looks as if the latest Mexican outrage would stir the Administration into action, at last. The insult to the American flag involved in the robbery of a crew that went fishing near Tampico in a boat from the U. S. S. 'Cheyenne' is one that cannot be passed, as many other acts of brigandage have been. An inquiry into the murder of John W. Correll, an American citizen, in the same region, is likewise under way. Since then Peter

Catron, another American, has been murdered in the City of Mexico. We note also that Theodore Patterson, the superintendent of the Mazapil Copper Company in Zacatecas, has been killed by other bandits while engaged in professional work. He was a Briton, and we trust that his government will stimulate the gentlemen at Washington to something more lively than 'watchful waiting'. Of that we have had enough and to spare.

WHEN a mining company reaches an age of 25 years and has produced gold steadily during the whole of its life, it is entitled to a celebration. We note that the twenty-fifth anniversary of the Great Boulder Proprietary Gold Mines was recorded at the recent annual meeting of the company in London. The mine has produced £11,649,970, or (taking the pound sterling at \$4.70) \$54,754,859 worth of gold, at a profit of £6,699,293, or \$31,486,677, enabling a distribution of £5,531,800, or \$25,999,460, in dividends; and the end of the life of this splendid property is not yet in sight, for over \$5,000,000 worth of ore is still in reserve. Moreover, the company is on the look-out for fresh mines to be operated under its existing excellent management, of which Mr. Richard Hamilton is the chief. He has been resident manager, at Kalgoorlie, Western Australia, at least since 1897, when the present writer visited the mine and went underground with him.

OIL-SHALE is an interesting topic of discussion at this time, so we are particularly pleased to publish a letter from Mr. Arthur L. Pearse on this subject, with which he is familiar, having himself had practical experience in the production of oil from shale and from coal. The figures of cost he gives are most welcome; also those of yield. Most writers on this new branch of mining content themselves with airy generalities, thereby failing to attract the more sagacious type of business man. Mr. Pearse lays stress on the question of marketing the product; that, of course, is one point on which the financial world or the investing public, meaning those who find the capital for mining enterprise, is sceptical. So long as liquid petroleum can be drawn from wells and pumped through lines of pipe for long distances, the shale-oil will be at a disadvantage unless the mine is close to a railroad. However, the consumption of well-oil is so great and the sources of it so limited that the day must come soon when a market will be available for rock-oil. The increasing price of oil favors this expecta-

tion. We note that Mr. Carl H. Bead, in Bulletin 177 of the U. S. Bureau of Mines, states that "the limit of oil production is being approached and that, although new oilfields undoubtedly await discovery, the yearly output must inevitably decline, because the maintenance of a given output each year necessitates the drilling of an increasing number of wells." Another factor is the draining of virgin ground by neighboring wells, thereby diminishing the anticipated yield of undeveloped areas adjoining them. While we deprecate undue optimism, especially such as lends itself to irresponsible stock-jobbing schemes, we believe that the profession can well afford to pay attention to the possibilities of shale-oil production, so as to be ready to guide the public when the occasion arises.

HUMOR is often unconscious. We find much to amuse us in the circulars and prospectuses of persons offering for sale either mines or machinery without knowing much about either. A little pamphlet describing a dry concentrator has been sent to us; we forbear mentioning the name because we believe the inventor and seller is acting and writing in good faith; but we think it fair to expose some of his blunders, because any man in his position ought to take pains to be better informed. In the pamphlet we are told that "the State of Arizona has more than 125,000 square miles. Much of this is wild waste land—and everywhere one may find black sand—which is only oxidized gold, that is, gold that has united with the oxygen of the air, defying all former processes," except, of course, the one now offered to the simple-minded miner among the cactus and prickly pear. We think it unnecessary to italicize the obvious blunder. Again, "there are many placer deposits containing unlimited quantities of free gold, but without water; nobody has ever been able to save these values." Well, there is "unlimited" water and "unlimited" gold in the sea and "nobody has ever been able to save" the more valuable of the two, in sufficient quantity, although many attempts have been made. However, we do not mind Mr. Dry Concentrator's nonsense about the resources of Arizona so much as his statement concerning the cost of operation. He gives an itemized estimate in which he puts down a superintendent at \$5 per day, a cook at \$3, a teamster at \$3, a furnace man at \$3, and eight laborers at \$2. Surely this is a bad anachronism, one cannot employ such men for such wages in Arizona at this time, unless it be Navajos or Papagos. By such figuring he gets a cost of 50 cents per ton, when it is dollars to doughnuts that the cost would be more than twice as much. As against the 50-cent cost, he expects a \$5 yield of gold. Of such flimsy fabric are dreams made. We hope the gold will not be oxidized.

DEPRESSION is the dominant note of a forecast made at Johannesburg by Mr. C. D. Leslie, consulting engineer to the Consolidated Gold Fields of South Africa, in his recent valedictory speech to the Institute of Engineers of South Africa. The impending cessation of operations at a large number of low-grade mines in the near-

eastern portion of the Rand goldfield moved him to sundry sad predictions. Fourteen mines, extending from the New Goch to the East Rand Proprietary, earned an average profit of only 14 cents per ton during the preceding quarter, and it must be remembered that only 70% of the so-called profit of these companies is translatable into dividends. The flow of water underground, says Mr. Leslie, is at the rate of 3000 million gallons per annum and costs about 50 cents per thousand gallons to pump. Should the increasing cost and decreasing yield of this group of mines compel a closing-down, the water would overflow into the neighboring properties and would penetrate the workings of the Central Rand, unless special efforts were made to arrest the inundation. Mr. Leslie is of the opinion that it would never pay to re-open the poor mines, in view of the water difficulty, the caving of the workings, and the decay of the plant. Not only has the pay of the white workers increased rapidly since 1914, but their efficiency has undergone a marked decline, and also that of the natives employed on the Rand. The cost of labor has increased \$1.25 per ton during the past five years. The outlook is anything but cheerful.

The Flotation Process and Its Makers

Last week's issue contained a letter from the firm of Sulman & Picard; this week we publish a short note of later date, in which these distinguished metallurgists ask us to draw attention to the "enormous benefit" conferred upon the mining industry by the Minerals Separation company, with which they are so prominently identified. Our editorial last week on the origin of the froth-agitation process dealt with one phase of the subject; for the rest, we are quite willing to recognize the services of Messrs. Sulman and Picard, and of the numerous other technicians employed by Minerals Separation Limited, in developing the flotation process, but to us it seems only a part of the big work done during the past fifteen or twenty years in applying the modifying influence of oil to the water used in concentrating the valuable constituents of ores. We would be quicker to express a generous estimate of the efforts made by Messrs. Sulman and Picard and their friends if we were not so hampered by the memory of facts. Unfortunately for the easy winning of a reputation for "impartiality," to which reference was made in the letter published last week, we recall the fact that the Minerals Separation's basic patent No. 835,120 was obtained in 1905, yet their own first successful application of their method was not made until eight years later, at the Inspiration mine in 1913. Speaking from the American standpoint and from the point of view of their American patent of 1905, it appears that they did not introduce their process to the American mining industry until eight years after the grant of the patent. Moreover, in an official report dated January 8, 1911, by Mr. J. M. Hyde, then on their staff, the statement was made that the tests performed in the Minerals Separation laboratory proved that "the copper

ores of a good part of the South-West and also of at least a portion of the Utah region contain chalcocite, which is not floatable by any of the methods so far tested." This referred to the big deposits of disseminated chalcocite to which flotation has been so successfully applied, by others, since then; the statement as made by Mr. Hyde, who severed his connection with the patent-exploiting company shortly afterward, summarizes the opinion of the Minerals Separation staff at that time. Mr. T. J. Hoover, who was their general manager and technical advisor, resigned in December 1910 and published his book on 'Concentrating Ores by Flotation' in 1912. In that book, which was carefully revised by Messrs. W. H. Ballantyne and S. Gregory of the Minerals Separation company and to the publication of which they gave a grudging consent, it is stated, "An ore in which the valuable minerals are wholly or partly bornite or chalcocite, as those of Bingham canyon, will probably give trouble to flotation processes, although not always, for among the many ores tested the one which gave the most uniformly satisfactory results was a copper ore assaying 2.8% copper, all in the form of microscopic specks of bornite." So he remarks: "It may be that only those where bornite and chalcocite are of secondary occurrence give trouble." The reference is to the ore of the Utah Copper Company, which has developed the application of flotation on an enormous scale. The mention of secondary enrichment, of course, would except all the great 'porphyry' mines of the disseminated type in Arizona, New Mexico, and Nevada, to which others have applied flotation so successfully. The evidence shows that their lack of knowledge concerning their own process, and their positive assertions concerning its metallurgic limitations, delayed the successful use of the process in this country, in which they had secured a patent, for eight years. It is true, Messrs. E. H. Nutter and G. A. Chapman, of Minerals Separation, made successful experiments, leading to the erection of a mill, at the Inspiration mine in March 1913, but in the same month Mr. T. A. Janney likewise made his first successful experiment on low-grade chalcocite ore at the Utah Copper Company's mill. Moreover, the success of the Inspiration mill was due, and is still due, largely to the use of the pneumatic froth-making machine devised by Mr. J. M. Callow. The effective application of froth-flotation to low-grade copper ores in the United States did not become a fact until 1915, that is, ten years after the date of the Minerals Separation company's basic patent. So we venture to submit to our readers that we are not ungenerous in refusing to give the entire credit for this valuable metallurgical process to the Minerals Separation people, because neither in its discovery, as pointed out last week, nor in its application, as above outlined, were Messrs. Sulman, Picard, and Ballot the only persons concerned. They have done a notable service by their persistent efforts, ever since 1901, to develop an effective process, just as the Elmore brothers for six years before them kept the idea of the use of oil as an agent of concentration before the public, but the flota-

tion process as used in American mills today is the product of research and experiment by a host of metallurgists and mill-men, at the head of whom we would be willing to place Henry Livingstone Sulman and Hugh F. K. Picard, but with them and sharing honor with them we would name Francis J. Elmore, Charles V. Potter, Guillaume D. Delprat, Alcide Froment, A. R. Cattermole, T. J. Hoover, J. M. Callow, J. M. Hyde, E. H. Nutter, G. A. Chapman, and Leslie Bradford, and a score of clever mill-men whose contribution to the art has been the development of the correct manipulation without which the scientific ideas of the others would have fared badly. The flotation process is not the brain-child of any one or two men; it is the composite product of the logical thought and the intelligent empiricism of at least a score of earnest workers. That is why we have fought the attempt of Messrs. Sulman, Picard, and Ballot to obtain a monopoly of the process and a monopoly of credit for the success of the process in the United States; and our opposition has been intensified on account of the high-handed methods adopted by them to bully the profession of which Messrs. Sulman and Picard are distinguished members, and, last but not least, on account of their ineffectual efforts to prevent the publication of information concerning the technology of the process.

Concerning Patents

Patents are intended to encourage and reward inventors by granting them sole rights to make, use, or sell their invention. Owing to the vast multiplication of mechanical devices and the enormous expansion of mechanical methods for performing industrial operations, the Patent Office has become of greatly increasing importance both to inventors and to the community at large. It has proved defective both in its procedure and in its performance, owing to the inadequacy of the staff and the resulting unsatisfactory examination of applications for patent. Moreover, the promiscuous granting of patents upon conflicting inventions and the consequent resort to an unsatisfactory kind of litigation have decreased the value of ownership in a patent and made it difficult for inventors of small means either to enforce their rights or to sell them to advantage. The National Research Council, one of the useful creations of the war period, appointed a committee to investigate the subject and to make recommendations. This committee will command confidence, for it consists of Messrs. William F. Durand, Leo H. Backeland, M. I. Pupin, R. A. Millikan, S. W. Stratton, Reid Hunt, Frederick P. Fish, Thomas Ewing, and Edwin J. Prindle. Of these the first is chairman of the committee, he and the two next in order are scientists and inventors; the next two are scientists, the sixth is a physician, and the last three are patent lawyers. This is a group of men admirably fitted to study the subject and to suggest the changes necessary in the existing law. They have made four principal suggestions. The first is that there shall be a single Court of Patent Appeals, which shall sit at Washington, and the head of it is to be

a Chief Justice appointed for life by the President; the other judges are to be selected by the Chief Justice of the U. S. Supreme Court from the various District and Circuit judges in the country and each is to sit in the Court of Patent Appeals for six years, or longer if re-appointed. Next, the committee proposes to make the Patent Office a separate institution independent of the Department of the Interior, under which at present it receives no proper attention or direction, simply because the Secretary of the Interior is swamped by the multifarious duties arising from the numerous bureaus in his charge, nor is he a man selected on account of possessing any of the special qualifications needed for the proper supervision of the Patent Office. Thirdly, the committee recommends a large increase in the number of patent examiners and an increase in their salaries, so that men of the requisite ability may be employed. Finally, the committee advocates an amendment of the law whereby proper compensation for infringement of his patent may be granted to the patentee. It is believed, by the committee, that "the comparative certainty of financial return would answer one of the most common and strongest reproaches against the patent system, namely, that a patent does not ordinarily pay the inventor any money, and it believes that the incentive to invent would accordingly be greatly increased." Yes, it would; and we sympathize with the committee's well-intended proposal for this purpose, but it seems to us conditioned upon the adjudication of questions of infringement by a court qualified to pass judgment by reason of a competent understanding of the technology involved in a dispute over patent rights. The personnel of the proposed Court of Patent Appeals fails to give adequate assurance of a consummation so devoutly to be wished. It is thought, apparently, that by selecting from among the judges such men as have shown aptitude for the understanding of patent problems, it will be possible to form an efficient court for this special purpose, but that; it seems to us, would simply perpetuate the evil of submitting highly technical questions to the adjudication of men without sufficient training in the sciences applied to such questions. In course of time the members of the Court of Patent Appeals, if constituted as recommended by the committee, would become well informed at the expense of the litigants, but why not make a clean break from an unhappy precedent and organize a court composed of men with the exact qualifications required for the duty, namely, patent lawyers. Moreover, steps should be taken to keep disputes over patents out of the courts as far as possible. The business-man of today has learned that a lawsuit is a gamble, he prefers to keep out of the courts, he is afraid of verbal technicalities on the one hand and of the judicial custom of falling back on precedents, however defective in their origin. So he submits his case to an arbitrator. By doing so he does not expect to save the fee due to an advisor, or even the expense of legal counsel, but he is able to submit his case to a man of sagacity unhampered by the apparatus of the courts. An official arbitrator or intermediary is needed for the

purpose of settling disputes over patents before they go so far as to require the intervention of a costly and uncertain litigation. Canada gives us a useful suggestion; there they do these things better in several respects. They have a Commissioner of Patents, who is empowered to abate the impetuosity of patentees and yet to protect them in their lawful rights. A patented invention must be manufactured within two years after the grant of the patent, so as to stop any dog-in-the-manger tricks. Furthermore, no invention can be imported "after the expiration of twelve months from the grant of a patent or an authorized extension of such period," except under special license. This is to compel domestic manufacture of the machine, but the Commissioner appears authorized to modify the regulation so that it may be reasonable in its incidence. Moreover, any person may apply to the Commissioner for a license to make, use, or sell the patented invention, in the event of the patentee refusing "to grant licenses to others on reasonable terms." In short, he is in a position to exercise discipline and to prevent a too exacting monopoly. In the United States the owner of a patent can decline to give a license to anybody at will or can levy a royalty as large as he pleases; he can charge one person a royalty of 10 cents and he can mulct another for 10 dollars; he need answer to nobody, unless, of course, he does something to bring him under the censorious eyes of the Federal Trade Commission, as has happened to Minerals Separation recently. It seems to us that it would be well if there were an officer of the Government, such as a Commissioner of Patents, empowered to hear patent disputes and to settle controversial points before going to a Court of Appeals. The Commissioner, even if occasionally he did not settle the dispute, would elucidate the salient technical facts and leave only questions of law for the Court of Appeals. We are reminded of the settlement of mining disputes by the Wardens in the Australian mining districts. Each district or group of districts has an official called the Warden, before whom come disputes over the boundaries of claims, trespasses underground, and other conflicts arising in the course of mining operations. It is a remarkable fact that mining lawsuits are rare in Australia for the simple reason that the decisions of the Wardens are usually so fair that it becomes unprofitable to carry the dispute into the courts. A Commissioner of Patents, with competent deputies, in order to deal promptly with any number of disputes as they arise, would be a boon and a blessing to a quarrelsome phase of human activity. In closing, we may state that we are not adverse to the grant of patent rights to inventors or to the reward to be derived therefrom by the pioneers of industrial progress; not at all. Some of our readers have interpreted our opposition to the Minerals Separation people as a desire to deny the rights of royalty to all inventors. That is not so. We have opposed them for reasons stated on another page in this issue and in the one preceding. We respect the genuine inventor and are glad to see him rewarded by being accorded special rights under the Government.

DISCUSSION

The Oil-Shale Industry

The Editor:

Sir—In your issue of May 24 you publish another interesting article by Mr. Hoskin. He speaks of the difference between American and Scotch shales, but there is just as much difference and a much greater variety of shale in this country; so much so in fact that it will be found necessary to adopt different methods of treatment. These differences are not only those shown by analyses but in the physical make-up; they require different methods of handling and no standard retort is adapted to every case. This is perhaps one of the reasons why more than 20 various kinds of retorts have been tried in this country, and still more are indicated.

Mr. Hoskin suggests a new name for oil-shale, but is this wise in view of the great line of division between shale that is represented by the Colorado-Utah deposits and the carbonaceous shales, both of which are bituminous?

He suggests that profits can be measurably augmented by making ammonium sulphate and crude potash. Saving some of the ammonia has for a long time been an integral part of the business, but as the extraction of good oil and ammonia is principally dominated by widely diverging temperatures, one or the other has to be sacrificed; to obtain best results in oil, lower temperatures are indicated, whereas for ammonia a higher temperature is demanded; in other words, low temperatures, 900°F. downward for oil and for ammonia up to 2000°F. This at once involves the question not only of the retort but the material of which it is constructed; consequently the cost and capacity of the retort. Certain moderate percentages of ammonia, of course, are recovered at low temperatures whether by wet or dry methods; the average recovery under present conditions is not 50% of the theoretical. As the Scotch shales are poorer in volatile but richer in nitrogen than the Colorado shales, more attention has been paid to the ammonia than is likely to be the case with the American shales of an average content of 0.55% or less. Regarding the potash, it is extremely doubtful if the cost and trouble involved are worth while; it was tempting when potash was worth \$300 per ton, or more, as a war product, but not under normal market conditions.

Mr. Hoskin says that the manufacture of shale-oil is "not a formidable process nor does it involve an expensive plant," and then he states what a plant comprises. The fact is that the recovery of oil-shale is a difficult art and if properly carried out involves more than he would

lead us to infer. It took the Scotchmen many years to make a success, and if "we should not base any plans for commercializing American oil-shales upon practices and successes in Scotland and elsewhere," are we to begin all over again or follow their lead?

Now as to expense: careful estimates for a complete 1500-ton Scotch type of plant, to be erected on this side, were a trifle over \$1500 per ton-day; at the present time this would cost 30% more, or, say, \$2000 per ton. Recently a 1000-ton plant for Colorado was figured at \$1200 per ton. Both were of the continuous vertical type, with regulation methods for oil distillation and ammonia recovery; more modern types, both in the retort end as well as the stilling end, can be erected for \$800 to \$1000 per ton for plants of 1000 tons capacity upward, if on a railroad and under normal conditions. A pre-war cost of refining including recovering the ammonium sulphate was 62c. per ton with sulphuric acid at \$6 per ton, while the retorting cost 40c. Today this cost is \$1.25 and 70c., respectively; add to these the cost of mining or getting the shale plus general charges and you have a basal figure it should cost to recover the prime products.

It is a fallacy to suppose that high percentages of recovery are most economical. It costs too much and the last oil is the poorest. I have heard it stated that the Colorado-Utah shales will run 55 gal. per ton, with 0.55 nitrogen; if you get 42 gal., or a barrel, the prime products should be 16 lb. of ammonium sulphate; 15 lb. of wax; 33 to 36 gal. of gasoline and lubricating oil, with a residue of uncertain value. Much lower-grade shale will be worked, and will depend on the amount of uncondensed gas obtained. Most modern retorts require only two-thirds the heat we used in the older forms of retorts, and so will treat lower-grade shale. Generally, the poorer the shale the easier it is to run, besides which the nitrogen does not necessarily fall with the volatile contents. Sometimes the reverse is the case.

Steam-shovel methods of mining shale have been condemned, because the poorer grades become unavoidably mixed with the better grade, but the ability to retort lower-grade stuff favors shoveling with its saving in cost of mining by 75c. to \$1 per ton.

Modern methods of coal carbonization help us much in the matter of retorts and retorting, and with the low temperatures indicated because of the low nitrogen contents of the shales referred to, the matter of retort construction is simplified; but merely condensing the gases in "air-cooled condensing-pipes" has given way to up-

to-date fractional condensation. A modern plant entails considerable capital expenditure and careful regulation, but it means lower running costs both in retorting and distillation with more satisfactory commercial results. To make a success you must carry the process further than merely separating the liquid from the non-condensable gases, and the recovery of ammonia. By fractional condensation the fractions can be obtained in one operation, and herein lies the profit.

Speaking of retorts, your contributor mentions a process in which gases of combustion are drawn upward through the charge. This method of heating was tried and patented years ago by certainly one of the most eminent men in the business, who personally told me it was abandoned because of the deleterious effects on the products evolved; this is easily proved by comparing the value of the oil produced by this method and that produced by ordinary methods of distillation. So it would seem that so far we are confined to distillation in air-tight retorts into which heated steam may be injected.

So many types of retorts have lately been designed that it is not possible to deal with them individually, but I am able to state that most any process involving mass carbonization is likely to fall out of competition. Indeed it is obsolete, except when the form and structure of the carbonized residue are of first importance, as in metallurgical coke, for instance. By 'mass carbonization' is understood the heating of a body of material, the particles of which are in close contact with each other, in contra-distinction to a condition in which each particle is unconfined. Mass carbonization involves the passage of the heat-units from the shell of the retort into the centre of the charge; it sets up the best heat-screen as carbonization proceeds. This is why the consumption of heat is so great in coke-ovens and the many forms of vertical retorts, both in shale and coal practice. The need for 2,000,000 or 2,500,000 B.T.U. per ton is common and is required because of the difficulty of causing the heat to penetrate the carbonizing material, which is always a good non-conductor. A good illustration of this is in a modern by-product coke-oven in which the diameter of the charge is, say, 14 inches; with a chamber temperature of 2000°F., it takes four hours to boil water in the centre of the charge. If small particles of shale or coal can be separately attacked by heat, not only is carbonization rapid but the gases evolve freely and need not be subjected to cracking or degradation, as is usually the case, and it can be effected by one-third less heat. By way of illustration, a half-inch cube of shale in a temperature of 750°F. requires five hours and a half to give off all its volatile, a quarter-inch cube requires three hours and twenty-five minutes, while in a temperature of 900°F. the time would be reduced to three and a half and one hour and a half, respectively.

Mr. Hoskin very wisely says there are many angles to the industry and only a few points can be discussed at a time. It is generally conceded that the industry has come to stay; the main question now is as to the best

marketability of the product, or in other words, the question of distribution, which is applicable not only to the shale-oil, but to mineral-oil generally.

The destructive distillation or carbonization of coal in many of its forms in some countries has created quite as much interest as the treatment of shale. The questions involved are much more difficult, but what is being done today in England, and, I am informed, what we shall hear from Germany, will doubtless be an education, and I am sure it will be very helpful to the shale industry. If the treatment of oil is not a formidable process, we have the satisfaction of knowing that far more difficult problems are being and will be successfully solved, and I am right in saying that the commercial treatment even of intumescens bituminous coal for oil has been successfully accomplished, and with due regard to the residue in the form of good metallurgical coke, which was certainly the most difficult problem of all. This question of the destructive distillation of shale or coal does not rest with them alone, but other forms of hydrocarbon, including wood, especially refuse, of which there are large quantities as sawmill waste, and which, instead of being a dangerous nuisance, can be turned into valuable products and power. Then the large quantities of lignite and peat, which are common, especially on the Western and Pacific slopes, will also come under consideration. Cheap power is necessary and will be in greater demand in the future; the road to it lies through by-product and producer gas, be it from shale, coal, or any other form of hydrocarbon.

I hope to hear more from Mr. Hoskin, for the future possibilities of the industry are great; it is being watched by people who have prevision, and although some say the time is not yet because of the present output of well-oil, it will soon be recognized as necessary and almost as easy to distill shale as oil, and quite as profitable; the risk is less, and the cost of obtaining the products from a barrel of oil-shale is no more than the average cost of a barrel of well-oil products.

ARTHUR L. PEARSE.

Minerals Separation

The Editor: -

Sir—We have read your editorial note in your issue of the 7th June, calling attention to the Supreme Court's decision in the Butte and Superior-Minerals Separation case, which you describe as a severe blow to the mining industry. May we suggest that you also call the attention of your readers to the other side of the case, that is the enormous benefit the mining industry of the United States has derived from the froth-flotation process as patented by Minerals Separation, even though those who profit by it may be called upon to pay a small royalty to the patentees, whose rights have been at last established by the Supreme Court?

Ruin and Restitution in France

By FRANK H. PROBERT

It is almost five years to a day since the fostered dreams of world domination by Germany assumed tangible expression by challenging the balance of power. The dream is dissipated, right has conquered might, but at what a cost! During the seemingly endless days of struggle the Allies looked to the United States for moral, financial, and material support, and finally for the man-power that gave strength to the knock-out blow. The peace treaty was signed after much discussion, deliberation, and delay, in the same room at Versailles as witnessed the preliminary parleys for the exacting treaty imposed by Germany on the French, concerning the price to be paid for the Franco-Prussian war, but has the world caught the reflection from the Hall of Mirrors of the ruins of northern France, or the image of crimes unthinkable? This is not the time to arouse or excite hatred of the Hun, but, 'lest we forget' that the wounds of France still gape and that crippled industry will have to struggle for many years, a few close-up views are worth contemplating.

In 1918 M. de Billy,* as head of the French High Commission visiting Washington, invited Secretary Lane of the Interior Department to send a commission to France to study the condition of the coal and iron mines and discuss with French engineers plans for the future. At that time many properties had been destroyed by shell-fire—a destruction inevitable in waging such a war—but since June 1918 ruin of another kind has been wrought and wrongs done that cannot be excused, explained, or exculpated. In January of this year I visited the Western Front as a member of the American Mining Mission, my associates being Dr. F. G. Cottrell, and Mr. George S. Rice, of the U. S. Bureau of Mines. Every facility and courtesy was extended to us by both the French and United States governments to carry out the investigation, and in three months we motored nearly 2000 miles through the Pas de Calais and Nord districts of the Valenciennes coal-fields, the iron-ore districts of Luxembourg, Lorraine, and Lorraine Annexée, and the coal areas of the Saar Valley. My remarks are not based on hearsay information; my convictions come from close personal contact with the conditions as they exist today, and the accompanying views were portrayed by my camera. Documentary evidence is available to show that it was the intention of Germany to destroy the mines of France and so render her commercially impotent; field evidence shows that their plans were executed systematically, scientifically, and almost successfully.

In order to understand the German strategy of the Western Front it is necessary to look back fifty years. At that time Germany had great coal mines in Westphalia and the Saar province, and but limited iron ore resources. The possibilities of eastern Lorraine were being proved and by the Treaty of Frankfurt, signed on May 10, 1871, France ceded to her conquerors all the outcrop mines of the vast iron-field. The boundary was drawn with meticulous care, guided by engineers and geologists, to include all the land known to be commercially mineralized, but when Thomas and Gilchrist, two English metallurgists, developed the basic Bessemer process to treat high phosphorus ores, the French explored the lands to the west of Lorraine Annexée, with the result that in 1913 the known reserves of the great Briey basin were owned by the Germans and French in the ratio of 2,330,000,000 to nearly 3,000,000,000 tons respectively.

Immediately following the close of the Franco-Prussian war the Germans developed their steel industry with great rapidity, and just before the outbreak of the recent war they produced 21 million tons of iron ore from Lorraine Annexée and purchased 9 million tons from French Lorraine, from which they made 19 million tons of pig-iron annually. Of the iron ore smelted in German furnaces 58% came from Lorraine Annexée, and with the return of this land to France, the domestic supply will be less than 20% of the capacity of the plants. France received German coke in return for iron ore. In normal times France is compelled to import coal to meet her domestic and industrial needs. In 1913, 43 million tons of coal was mined from the Valenciennes field and 20 million tons imported. Here then was the situation; an iron ore supply coveted by Germany coextensive with Lorraine Annexée, and practically all the coal mines lying immediately south of the Belgian border. The German hordes swept down into France and for over four years the titanic struggle was fought out on the fringe of the mineralized area. Two-thirds of the iron reserves were in the hands of the Enemy during the War. It was in order to strengthen the hold on this important asset that the St. Mihiel salient was formed and Verdun attacked in 1916, while the bitterest of battles were ceaselessly waged for possession of Lens, the centre of the coal-field. Both iron and coal mines were worked by the Germans during their occupancy, worked as intensively as their diminishing virile man-power would permit; captive labor was forced to assist, and compelled under threat of death to participate in the wilful destruction, as soon as the inevitable result of the war was realized. The steel works of Lorraine, metallurgical

*We regret deeply to record the fact that Colonel Edouard de Billy was thrown from his horse and killed on June 12 in France.—Editor.

plants planned and equipped with every modern device for efficient operation, were quickly modified to turn out weapons of war during the first year of the conflict, after which, as I shall show, they were dismantled piecemeal; the desirable equipment being transported across the Rhine, the rest destroyed with a deviltry difficult to comprehend. At the south end of the district the steel plants at Pont-a-Mousson were damaged by shell-fire: this town was never occupied by the Germans, but from Briey northward to the Luxemburg line, the wonderful works have been sacked and wrecked beyond recognition. Coal and iron are complementary minerals, the two *grand siegneurs* of the mineral world. From them are fabricated the weapons of war as also the plowshare of peace; with them a nation is strong financially, commercially, and industrially, always, of course, assuming the legitimacy of motive prompting production. Bismarck characterized the former war as one of "blood and iron," the iron of Lorraine was the price of peace, and the industrial association of Berlin and Dusseldorf in 1917 declared to Hertling and Hindenburg that "the annexation of the Briey and Longwy basin is indispensable because the possession of this region is of incalculable value to Germany for economic, industrial, and agricultural reasons, in view of a future war."

In 1913 the 29 iron mines of the invaded section of the Briey and Longwy basins gave employment to 15,200 men and produced 17½ million tons of ore. During the four years following August 1914 the Germans worked the mines intermittently, they shipped all of the ore on the stock-piles to the steel works, and mined at the rate of 30% normal output. The underground workings were not seriously damaged at any of the properties, although many of the surface plants, particularly the miners' dwellings, were razed. The damage is more indirect and the visiting engineer notes that the ore was removed from the most convenient workings; pillars have been robbed near the main galleries, thus threatening the arteries of underground transportation; the extraction of ore without proportionate advance of development headings will postpone the pre-war scale of output for some time; the machinery has been abused for want of lubricants and every ounce of copper, the trolley-wires, motors, brass fittings, as well as all rubber, have been removed. The truth of the story that thunderous applause followed the statement of the Chancellor in the Reichstag denying the shortage of copper was drowned by the noise of the tinsmiths removing the copper sheeting from the roof of the buildings, is emphasized wherever one goes in the invaded territory.

Unquestionably large sections of the developed areas underground will be permanently abandoned because of the improper mining done by the robbers. At St. Pierremont I was impressed by the extraordinary regard for the welfare of the workmen; hundreds of cases of mineral water were stored at the shaft-station on one of the levels for the Germans to drink, fearing the valiant had copied the vicious and contaminated the water supply!

Iron ore is of no value unless it can be beneficiated. What has happened to the steel plants? Visit Micheville, go to Longwy, ponder the ruins at Mont St. Martin; never a shell was fired here, but the destruction is complete. At the first mentioned plant M. Nahan, the veteran manager, bowed with the weight of years and tormented by the nightmare of recent events, tells of the conscription of 2000 of his Italian workmen to destroy the model plant. German officers dwelt in his house while he was kept prisoner, presentation bronzes were confiscated for the few pounds of copper they contained, and the plant itself, what of it? all machines that could be moved were shipped to the Fatherland, the rest destroyed; it is a mass of fallen stone and twisted steel, a scrap-heap impossible to describe. At the Aciéries de Longwy, the largest steel works in France and employing 7000 men before the War, the ground must be cleared clean that a new mill may memorialize the irrepressible spirit of France. Here one sees train-loads of high-grade steel cut up into movable pieces that were to have been sent to Hunland to be turned into shells; the crankshafts, rollers from the mills, and cylinder-heads were cut with the oxy-acetylene torch or broken by liquid-air cartridges (high nitro-glycerine explosives were getting short toward the end), the boilers were blasted, and the structural steel of the buildings cut at the base, to be overturned. M. Dreux, the managing director of the company, showed me two antique brass candle-sticks on the mantel of his living-room labeled by the marauders and spared to posterity because they were considered 'works of art'. Surely such magnanimity entitled Germany to mercy at the peace-table!

The Pas de Calais and Nord coal mines have suffered even more than the iron and steel plants. The damaged area embraces 24 of the 27 concessions; the Bruay mines were not forced to shut-down although damaged by long-range shell-fire and aerial bombs; eight concessions suffered from artillery bombardment and were later pillaged, while toward the eastern end of the district sabotage finds its most glaring expression. Twelve concessions had the surface plants of the many mines completely destroyed wilfully and systematically during the final retreat of the defeated Germans, even as late as October 28, 1918. The coal measures are overlain by water-bearing strata and quicksands, so that the shafts were sunk by special boring methods and lined with steel cuvellage; this was blasted with dynamite and the mines flooded. Of the 286 shafts 70 were dynamited, 172 are now filled with water, and 235 of the surface plants, magnificent steel structures built with the idea of permanency of operation, are partly, more often totally, destroyed. The few that escaped show the nature of the crime committed, for every building, every head-frame, bears a label giving the estimated quantity of high explosive necessary to wreck it. Many of the steel supports were cut by the oxygen flame and tumbled over into the already flooded shaft. The accompanying photographs tell the story better than words. Lens, the centre of the coal-field, is completely destroyed and presents one

of the dreariest spectacles imaginable. Near Lens the little river of Souchez was turned into the mines and for part of its course has disappeared, now flowing through the underground workings. Between Bruay and Valenciennes there is widespread, deliberate, and malicious destruction. Bethune, Lens, Courriere, La Bassée, Douai, and other coal-mining centres, are crushed and crumbling ruins.

The problems of reconstruction, reparation, and rehabilitation are many. They are faced with a fortitude, courage, and determination equal to the gigantic task, and they will be solved. France has lost during the War 75% of her peace-time industries, the debts now aggregate three-fifths the total wealth of the country, her young man-power is sadly depleted and greatly exhausted, during the War the deaths exceeded the births by 800,000, but, while materially impoverished, France is morally strengthened, and moral energy is as important as material resource. Full restitution for the wrongs done is impossible except in so far as the allied powers combine to permanently wreck the national industry of Prussia—which was to wage war.

The peace treaty of June 28, 1919, gives to France Alsace-Lorraine, 5600 square miles, the frontiers to be as before 1871. In part compensation for the destruction of the coal mines, and as reparation, Germany cedes full ownership of the coal mines of the Saar Valley with their subsidiaries, accessories, and facilities. This is but a sop, for if France will benefitiate the additional iron ores of Lorraine she must purchase proportionately larger quantities of coal. The coal situation was menacing before the War; it is now aggravated. In 1913 it was necessary to import 20 million tons, and this when the Valenciennes field was giving its normal output. The whole product of the Saar mines in actual tonnage, saying nothing of the inferior quality of the coal, is not sufficient to offset the lack of coal from northern France. The Saar produces four grades of coal, none having the calorific value of the coals of northern France or of Westphalia. They can be used most advantageously for steam and domestic purposes but they are not good coking coals, one ton yielding little more than half a ton of coke, which is friable and of very inferior quality metallurgically. The Saar coal is sometimes referred to erroneously as the economic complement of Lorraine iron. Under German control the iron ores of Lorraine, the coal of the Saar and Westphalia, and the steel plants of all three districts, were treated more or less as a unit industry and most effective exchanges were made by means of the available cheap transportation. It is of vital importance to France that this exchange be maintained under intelligent government control; if coal from Westphalia is withheld the steel industry cannot expand, and either many of the iron mines will remain idle or a great surplus must be exported.

It would be presumption on the part of an American mining engineer to suggest improvements in methods or practice in French mining. The French engineers have long known their own problems and have solved them in

accordance with their system of finance. Their mines are developed and equipped with the idea of permanent industry, and unless there is serious labor unrest and extraordinary advances in wage scales, the old French practice is peculiarly suited to French conditions. Their policy is progressive and there is constant search for new mineral areas or extensions of proved deposits. French Lorraine has greater reserves of iron ore than Lorraine Annexée and just before the outbreak of the War drill-holes had shown the extension of the coal measures of the Pas de Calais southward. Iron and coal are complementary minerals. France will have them both in larger quantity than in 1914, and when her reconstruction program is carried out, the steel industry will be among the first assets of a land that has suffered greatly.

Electrostatic Separation of Zinc Ores

Electrostatic separation is one of the processes used for separating mixtures of sulphides of the same specific gravity that are not amenable to gravity concentration. Zinc-ore mixtures of pyrite and sphalerite in coarse crystals are often treated by this process. Such ore needs only drying before treatment on the electrostatic separator. The non-conductive mineral particles pass through the separator inert, but the particles of the conductive minerals acquire an electric charge and are repelled from one electrode. Sphalerite is a poor conductor or a non-conductor, and pyrite is a good conductor. Galena is likewise a good conductor and accompanies the pyrite. Fine dust cannot be treated on such a machine, its use being limited to the treatment of sand. As ores vary widely in their electrical properties, the only way of finding whether a given ore of zinc sulphide and other sulphides can be separated by this method is to test the ore in a commercial machine. With some ores electrostatic separation produces concentrate of commercial grade without further treatment, but as a rule none of the electrostatic or magnetic processes will make a clean separation of the average complex sulphide ore found in the inter-mountain States. The fact that pyritic ore does not have to be roasted before electrostatic separation is important, as the sulphur can be saved, if desired. If the magnetic-separation process were used, some of the sulphur in the ore would be burned off and would escape in the smelter gases, forming a nuisance. Another advantage of the electrostatic method is that mixtures of galena, pyrite, chalcopyrite, and sphalerite can be separated into one product containing the first three minerals mentioned and a second product containing the sphalerite. These two products can both be marketed to good advantage. The magnetic-separation process makes one product containing the iron and copper and another product containing the lead and zinc; and this latter mixture cannot be marketed to as good advantage as if the lead and zinc minerals were separated.—D. A. Lyon and O. C. Ralston in Bulletin 168 of the Bureau of Mines.

Method of Handling Granulated Slag at Anaconda

By OLIVER E. JAGER

When the Anaconda reduction works commenced operations in 1902, not the least among the noticeable features was the ample provision for the disposal of slag. Seventeen years operation, with increased tonnage during recent years, has altered this happy state of affairs, till at present, while it is true that there is still plenty of space on which slag may be deposited, there is no longer a free fall from the ends of the slag-launders. In seeking a solution of the problem, the adoption of elevators, conveyors, tailing-wheels, or other similar devices, presents some difficulty owing to the rapid rate of growth of the dump, which, under normal conditions of plant operation, must be arranged to receive about 3800 tons of granulated slag during every 24 hours. The system finally adopted may be regarded as a combination of the two standard methods of slag-disposal, namely, granulation and haulage. In brief, the granulated slag is run into settling-pits, where the water is separated from it, the pits being then excavated mechanically and the slag put into cars, which are hauled to the edge of the dump and emptied. Besides its simplicity, this method has the advantage that no machinery has to be moved as the dump grows larger, only the railroad track having to be swung out from time to time. Also, the dump being circular, the larger it grows the less frequently need the track along its edge be moved. The method is shown diagrammatically in the sketch, in which dimensions are approximations only. See Fig. 1.

Axle load, 43,725 lb.

FIG. 2. SLAG-CAR

Two main launders, lined with reinforced slabs of slag, carry the granulated slag from the reverberatory building to the dump. These launders bifurcate at a convenient distance from the settling-pits, so that there is a discharge into each of the four pits. To prevent the stream of slag from channeling its way straight across

the other track. The hoist is made by the Industrial Works of Bay City, Michigan. It has electric drive, and is capable of lifting 25,000 lb. at a radius of 30 ft. It is provided with a clamshell bucket of 3.5 yards capacity, with mild-steel edges, as the material handled is not hard enough to call for an edge of special steel. A bucket of larger capacity was first tried, but it was not successful. There are two such hoists in the equipment. The comparatively dry slag is easily excavated, a train of four cars (a total of 80 cubic yards) being filled in about 20 minutes. Excavation of the slag is carried to a depth of about 10 ft., leaving an outline somewhat as indicated in the sectional view.

The effluent water runs along the main launder *F*, through a mechanical sampler *G*, and then to waste. There is now in course of construction an installation for reclaiming this water, which, though not clear, is suitable for re-use in granulating slag at the furnaces. When this scheme is in service, the water from the pits will be deflected into a tank *H*, 50 ft. in diameter by 9 ft. deep, provided with a baffle *J*,

reaching five or six feet from the top to cause the water to circulate and clarify before it overflows to the pumps. The tank has a pipe at the bottom for flushing out. The water will be handled by two 12-in. Cameron single-stage centrifugal pumps, each with a capacity of 5,000,000 gallons per 24 hours against a head of 160 ft. The pumps are direct-connected to 300-hp. motors running at 1800

the settling-pit to the exit-launders *A*, baffles *B* are placed about 6 ft. in front of the exits, thus causing the water to deflect and pass round the ends of the baffles. This arrangement provides good settling for the slag. The spaces *C*, between the baffles and the front walls of the pits, become filled with slag, which is removed only when it becomes troublesome. To do this, gates are opened to the launders *D*, which are placed below the launders *A*, allowing the slag to run directly to the dump. This is also a safeguard to be used in case of accident. As the slag fills the pit, boards are set in the exits *E*, to raise the level at which the water overflows, though this does not require much attention once the spaces *C* are filled.

As originally built, there was one long pit only, but as it was found difficult to excavate the submerged slag, and also that the slag-water mixture had an abrasive action on the bucket-gear, the long pit was divided into four smaller ones of more or less equal size. Another difficulty in handling wet slag was that in winter there was an accumulation of ice on the cars and on the dump-tracks. Slag is allowed to run into two empty pits, one for each main launder, till they are filled to within 2 ft. 6 in. of the top, when the stream of slag is deflected to the other two. The water soon drains from the full pits, as there is no bottom to them, the whole structure being simply placed on top of the slag-pile in a manner to be described later. The hoist is then brought along the track nearest the pits, while the train of cars stands on

r.p.m., and discharge into a machine-banded redwood-stave pipe of 18 in. diameter coated with tar and sawdust.

The two lines of track beside the settling-pits are carried on 25-ft. piles driven into the slag. To form the back of the pits, two-inch planks are spiked to the piling

EMPTYING GRANULATED SLAG FROM POTS

ROLLING-DUMP CAR FOR GRANULATED SLAG

under the outside rail. Both the partitions between the pits, and the baffles, are made of piling and planks, the piles for the baffles being down 15 ft. only. The two ends and the fronts are not so heavily constructed, as they have less weight against them, 6 by 6-in. timbers being used instead of the piles.

The U-dump cars, into which the slag is loaded, are of a special design patented by Ernest Junghanns, a draftsman at Anaconda. As shown in the photographs, they dump by rolling to one side, the contents being shot out 3 ft. 3 in. clear of the track, thus obviating the necessity of cleaning the tracks after each train is dumped. Dumping is performed by admitting compressed air into the cylinder attached to the under-side of the car-frame. This cylinder is hung on trunnions to allow of its turning as the car dumps. It is fitted with a telescopic piston the two members of which are of 15 and 7½ in. diameter respectively, with strokes 1 ft. 10 in. and 1 ft. 6 in., or a total stroke of 3 ft. 4 in. The cars dump with ease, owing to the nicety of balance, and the car-body resumes its original position by gravity when the air-pressure is released. Compressed air for dumping is piped along the train from the locomotive, and each car also has a container holding sufficient air for dumping in case of accident. The cars are of 20 cubic yards capacity; nine cars are provided.

Westinghouse electric locomotives, weighing about 30 tons each, are used to haul the cars. There are two of these locomotives in the equipment, and each carries an air-compressor plant consisting of three compressors of type D4, made by the Westinghouse Traction Brake Co. These provide the air necessary for dumping the cars, operating the spreader, and for braking the train. A fan is also carried for cooling the traction motors should over-heating occur. The pressure of air is automatically maintained, the high and low limits of the control being 130 and 90 lb. respectively. A Jordan spreader is included in the equipment, as it is necessary to plow off the edge of the dump from time to time as the slag piles up. This machine operates by compressed air. 500 volts D. C. is taken from a third rail beside all tracks except that next the pits, where it would be unsafe on account of operating the hoist, so the latter machine is fed by a cable. The dumping-track is of circular form, and is at present about three-quarters of a mile around. As the edge of the dump extends, the track must, of course, be cut and moved farther out, to facilitate which gaps are left at intervals in the third rail, connection being made between the rail ends by a piece of cable having plenty of slack. As the track is moved out the gap widens, till it finally grows too large for the locomotive collecting-shoes to bridge over, when another piece of rail is put in and a gap left elsewhere. The third rail is protected by a wooden box, which is also in sections to facilitate moving. The dump-tracks are of 60-lb. rail, and are well maintained. A repair shop for all this equipment has been erected on the dump itself.

For the blast-furnace slag there is a smaller installation consisting of two settling-pits situated at another

part of the dump, but whose tracks connect to the circular dumping-track and to the rest of the system.

The sloping face of the pile of granulated slag, on the side next the Butte, Anaconda & Pacific railway, is prevented from slipping by putting in rows of fencing made of planks spiked to posts set in the slag. Any movement of the granulated slag on this side would tend not only to cover up the railroad-tracks, but would also endanger the pits and launders on top of the slag-pile.

Bureau of Public Works

Seventy-one delegates, representing 74 organizations with a membership in excess of 105,000, recently attended a conference of technical societies in Chicago. It was called by Engineering Council, and unanimously adopted a resolution urging Congress to establish a Department of Public Works. Among the activities that logically belong to such a department are the following:

Bureau of Public Roads; the United States Reclamation Service; the Alaskan Engineering Commission; the Construction Division of U. S. Army; a Bureau of River, Harbor and Canal work, including such functions as are now exercised by the Mississippi River Commission and the California Debris Commission; a Bureau of Architecture; a Bureau of Surveys, including the Coast and Geodetic Survey; a Bureau of Mines; the Geological Survey; the Forest Service, at least until the same is divorced from the supervision of water powers and road building; and the Bureau of Standards.

Later the following resolutions were adopted unanimously:

Resolved, That this conference be known as the Engineers, Architects, and Constructors Conference on National Public Works; that it continue in existence until dissolved by its own action and that its officers and committees be empowered to further the organization and development of a National Department of Public Works.

Resolved, That for the purpose of furthering the passage of a bill for the creation of a National Department of Public Works there be set up by this Conference an Executive Committee, a Committee on Text of Bill, and a Campaign Committee. The Executive Committee shall have the power to create a Finance Committee and other committees and to add to its own membership or to that of its committees.

Resolved, That the facts be presented to the President and to the Congress, and that they be urged to make adequate provision for the entire work of completing the topographic map of the United States in the shortest possible time compatible with requisite accuracy; and inasmuch as Engineering Council has already taken up this matter with Federal Government Departments, their efforts to hasten the completion of the topographic map be endorsed by this Conference and that this resolution be entrusted to them to present to the President, the Secretary of the Interior, the members of the Congress, and to make such other disposition of it as will, in their judgment, further the end desired.

Technical Writing: Slovenliness

By T. A. RICKARD

*Slovenliness is as disgraceful in words as in clothes. Much writing that we recognize as poor in style is merely sloppy. Just as some students postpone the necessary shave or forget to change their collars, so young engineers drop their articles, definite and indefinite, or omit prepositions where they are required, as if to compensate for those they use unnecessarily.

(1) "[During] the preceding summer I went to Nevada."

(2) "The work will begin [on] Saturday."

(3) "Flotation in America [during] the last two years has made tremendous strides."

(4) "All such work helps [to] solve the problem of efficiency."

The sign of the infinitive should not be omitted; this is a common blunder. In the June 'Atlantic', Vernon Kellogg writes: "And it includes the thought that such justice is needed to *help bring* the light into the dark places of this world."

(5) "At first the work was interesting and [was] liked by most of the men."

The verb 'be' is used both as a principal and as an auxiliary.

(6) "The drop of *crusher lubricating oil* could not get into the bin and mix with the ore."

The adjectival use of nouns leads to a jumble; he means

"The lubricating oil on the crusher could not drip into the bin and mix with the ore."

(7) "Construction of the mill started [on] August 12, 1915, at which time 75% [three-fourths] of the excavation was completed."

Abridgements that leave the reader to guess the writer's meaning are bad. Mr. Roosevelt writes:

(8) "While camped on the 'Nzoi, the honey-birds were almost a nuisance."

Mr. Roosevelt and his party, not the honey-birds, were camped on the 'Nzoi. Such elliptical phraseology is slovenly.

Do not omit the connecting pronoun.

(9) "Their vein is not as wide, nor the ore as rich, as the Combination."

"The vein in their mine is not as wide, nor the ore as rich, as that in the Combination."

(10) "Many mining booms such as [those of] 1906 and 1916."

(11) "A rate of drilling much superior to [that of] the old piston-drill."

A finite verb must agree with its subject, says the rule.

(12) "One of the most brilliant contributions to geology that *has* [have] been made."

The correct form sounds awkward; the attractive form is wrong; avoid both. The clause "that has been made" is redundant.

(13) "Any one can measure with a glance, when *they* are tired."

Ruskin, who wrote this, meant 'when he is tired' or 'when tired'.

Participles are commonly misused by novices. The dangling of a participle at the beginning of a sentence contravenes the rule of grammar that the substantive to which a participle relates must appear in the same sentence. For example.

(14) "Approaching the vein, the serpentine is seen to be decayed."

"As we approached the vein, we observed that the serpentine was decayed."

(15) "Examined carefully no fossils were detected."

"Although I examined the rocks carefully, I could detect no fossils," or "Although the rocks were examined carefully, no fossils were detected."

(16) "Turning westward there is a striking change."

"Turning westward the observer beholds a striking change."

(17) "In going seaward the boulders become smaller."

"Toward the sea the boulders are smaller."

Even practised writers are frequently guilty of the error of using participial phrases having no logical relation to the clauses preceding. Thus:

(18) "The sandstones are massive, occurring chiefly in the lower half of the formation."

"The sandstones, which are massive, are chiefly in the lower half of the formation."

(19) "The output of the mine is about 100 tons daily, its assay-value being \$50."

"The daily output of the mine consists of 100 tons of ore, averaging \$50 per ton."

Another misuse is illustrated in the sentence:

(20) "The vein has a general width of 1 to 6 inches, *widening* [but] in places [it widens] to 12 inches."

Here the participle is used as an adversative, or contradicting, term.

(21) "The limestone *occurs resting* [rests] upon the quartzite."

(22) "These dikes *were found cutting* [cut] the granite."

(23) "The cliff *rises facing* [faces] the river."

The choice of the wrong subject-nominative leads to wordiness:

*Another chapter from the forthcoming book on "Technical Writing," to be published by John Wiley & Sons, New York.

(24) "*The drainage of the area is accomplished* [drained] by three streams."

(25) "*The collection of the statistics is done* [are collected] by correspondence."

Delete the first three words in each of the two foregoing sentences.

(26) "*Confirmation of these reports cannot be obtained* [confirmed]."

As says Mr. George M. Wood,¹ from whom the three preceding examples are borrowed:

"The writers of these sentences, having 'used up their verbs' in their subject-nominative, could find no suitable predicate-verbs and were compelled to employ instead more auxiliaries or inappropriate words."

The use of 'due' at the beginning of a sentence in the sense of 'attributable' is a common error, for the reason that a causal phrase, which is adverbial, should not be introduced by an adjective.

(27) "*Due* [owing] to the *psychological* attitude of *labor* [Labor] and the scarcity of skilled operatives, it is far more difficult than ever before to secure high efficiency."

Delete "psychological", which is redundant.

(28) "Such problems are nearer solution; *due* [thanks] to the researches of Bragg and others."

(29) "This is explained by the fact that this substance, *due to* [in consequence of] the predominating effect of the calcium, coagulates the slime."

(30) "*Due to* the nature of the ore, it is expected to obtain a smelting ratio of seven of ore to one of coal."

Here 'due to' stands for 'in consequence of' or 'owing to'. Again:

(31) "*Due to* the rise in copper, many mines are being re-opened in this district."

Those who fall into this bad habit are also likely to begin their statements thus:

(32) "*Indicative of* the success of the method is the cost which is now 60 cents per ton."

This can be improved:

"The success of the method is indicated by the low cost, which is now only 60 cents per ton."

'Tend' is a word that prolongs a sentence without adding to the sense. Many writers enfeeble a verb by inserting the superfluous 'tend'.

(33) "The use of flotation *tends to aid* [aids] the saving of copper in chalcocite ores."

(34) "Such methods *tend to cheapen* [cheapen] the operation."

Unemphatic words at the beginning of a sentence usually precede roundabout statements:

(35) "*Because* the surface tends to contract with a definite force does not mean that it is coated with anything like a rubber membrane."

It would be better to write:

"The fact that the surface tends to contract with a definite force does not prove that it is coated with any-

thing like a rubber membrane" or "The tendency of the surface to contract etc."

Here is another example of a poor beginning:

(36) "*By* such a system I believe we could establish a foreign trade based on honesty of goods *which* other nations would find it hard to take from us."

Here 'by' is a weak introductive. He means:

"Such a system, I believe, would serve to establish a foreign trade so well based on honesty of goods that other nations would find it hard to compete with us."

'While' is another little word much misused. Instead of being restricted to its primary function as an adverb of time, it is employed as a conjunction synonymous with 'whereas', 'though', 'but', or 'and'.

(37) "*While* [whereas or although] coal and iron command high prices, oil has become cheaper."

(38) "At some points the ore is 4 feet wide *while* at others it narrows to 6 inches."

Insert a semicolon after "wide" and delete "while".

'Along these lines' and 'along this line' is a common crudity. It is neither precise nor clear.

(39) "Examinations *along these lines* were made every year."

"Examinations of this kind (or for this purpose) were made every year." Perhaps "similar examinations" would express the meaning, which is still left in doubt.

(40) "The development of the mine *along this line* is sure to prove successful."

"The development of the mine in accordance with this plan is sure to prove successful."

(41) "Investigations *along* petrographic lines are not needed."

"Petrographic investigations are not needed."

'Occur' and 'occurrence' are over-worked, especially by geologists. They are words to be used sparingly.

(42) "The other *mineralogical occurrence* [mineral] I found in the Gila Canyon Consolidated Copper Co.'s mine."

He is referring to another mineral, not to another find of the same mineral.

(43) "There are seldom any signs of secondary copper enrichment, unless it be the occasional *occurrence* along cracks of pyrite."

He means: "Signs of sulphide enrichment are rare, except where the pyrite has been deposited along cracks." "Occasional occurrence" suggests time; he means place; here and there the pyrite was detected by him along the cracks. "Cracks of pyrite" is a bad phrase.

(44) "The gold *occurs* [is] distributed over a large area."

(45) "The fluorspar mines *occur* [are] in Pope and Hardin Counties."

Usually 'occur' takes the place of a word that is more specific.

(46) "Hardwood trees *occur* on these slopes."

The word he needed was 'grow'.

¹'Suggestions to Authors', by George McLane Wood. U. S. Geological Survey. An extremely useful pamphlet.

(47) "In parts of the mine where the fault occurs, the veins are shattered and impoverished."

He means that where the veins are crossed by the fault, they are shattered and poor in gold.

(48) "The telluride occurs in [lines or encrusts] the interior of the cavity."

A 'cavity' is a void, considered with reference to the circumjacent material. "The telluride encrusts the cavity."

(49) "Underlying this decomposed garnet in the formerly barren crystalline lime [are] the secondary zinc ores occur."

Delete 'occur' and end the sentence with a significant word.

Writers who overwork 'occur' are likely to introduce their statements with 'there is' and 'there are', both of which are poor locutions—the mere tuning of language.

(50) "Wherever the galena occurs there is an increase of silver in the ore." The man that wrote this failed to say where or how the galena was distributed in the lode or vein, and thus omitted a necessary item of information.

"Wherever the galena is seen, there the ore is richer in silver."

(51) "Small packages can be easily carried and there is not the incentive to drop them by the carriers." This can be amended thus:

"Small packages can be carried easily, therefore the carriers are not tempted to drop them."

(52) "There are few Cornishmen employed at Treadwell."

(53) "I question whether there is any probability of succeeding with this process."

These statements may be improved thus:

"Few Cornishmen are employed at Treadwell."

"I question whether the process can succeed."

(54) "There are more men killed in metal-mining in the United States, in proportion to the number employed, than in the country's coal mines."

Here 'there are' merely detracts from the force of the statement; start with "More men are killed" and note how much more direct and forceful it is.

'It is' belongs in the category of feeble introductions.

(55) "It is the belief of the miners that the ground now worked may be a slide."

"The miners believe that the ground, etc."

(56) "It is a sign of richness in gold when the quartz is ribboned."

"The ribboning of the quartz indicates richness in gold."

Begin and end a sentence with an emphatic word, as far as may be practicable without stilting the phraseology.

Avoid redundancy. In the following examples the italicized words should be deleted:

(57) "The railway should be finished in nine months time."

(58) "It requires several weeks or months time to treat the ore."

(59) "The mine is three miles distant from the mill."

(60) "Timbers are set at a distance of 4 ft. 2 in. centre to centre."

(61) "The peak is 12,750 ft. high above sea-level."

(62) "Manganese if present can be precipitated at the same time as the iron."

It must be present in order to be precipitated.

(63) "It is best to use zinc sheets 2 feet by 3 feet in size."

Do not attempt to be impressive by piling one word on another.

(64) "Records were started with this ultimate end in view."

(65) "He cannot return home before the final completion of the mill."

(66) "This oil will serve equally as well as oleic acid."

(67) "The roasting will require probably about seven hours time."

Study the meaning of words so that you will not employ 'evince' or 'evidence' when you mean 'show'; 'phenomenal' when you mean 'extraordinary'; 'transpire' for 'become known'; or 'problematical' for 'doubtful'. As you obtain literary taste, you will abhor 'advent' as a synonym for 'introduction' or 'arrival'; 'situation' for 'state'; 'eliminate' for 'extract', 'avoid', or 'destroy'; 'proposition' for 'proposal'; 'contemplate' for 'plan' or 'intend'; 'balance' for 'compensate'; and 'unethical' for 'improper'.

(68) "The stamp-mill held its own until the advent [introduction] of the cyanide process."

(69) The treatment of the pyritic copper ores awaited the advent [application] of modern smelting methods."

(70) "The cyanide situation [scarcity of cyanide] in Northern Ontario."

(71) "A tramway will be built around Mineral lake to eliminate [avoid] the use of barges."

(72) "The proposition [proposal] made by the union was rejected."

(73) "The erection of one smelter and the completion of others now contemplated [planned or proposed]."

(74) "It would be unethical [improper] to disclose my reason for withdrawing from the case."

(75) "The natural expectation would be that they [each] (Carranza and Villa) will each [would] start in to eliminate [destroy] the other."

No man with a right feeling for language would be guilty of such lapses. Acquire good taste by reading good literature: Huxley and Spencer, Thoreau and Lowell. Read 'The Atlantic Monthly', not 'The Saturday Evening Post'; read 'The Outlook', not 'Hearst's Magazine'.

If you read only second-rate stuff, you will lose the taste for good English, and the quality of your own writing will suffer, until you may be guilty of such lapses as the following:

(76) "There are companies arranging to install commercial size units of several new inventions. It is far from probable that all these schemes will prove successful and therefore one anticipates hearing of disappoint-

ments experienced by the pioneers in this work."

He may have meant to say:

"Several companies are arranging to erect working units based upon new inventions. It is unlikely that all these schemes will prove successful, and one may anticipate that the pioneers will suffer many disappointments."

(77) "In practically every instance, operators plan to make the fuel item a self-contained proposition."

He is speaking of oil-shale, and he means:

"Most of the operators plan to use the shale for fuel."

(78) "These often contain cassiterite, sometimes in profitable quantities, but long before the water sorted gravels are reached the wolfram has disappeared, though it comes from the same lodes as the tin ore where it almost invariably occurs in considerably greater quantities."

Probably he meant:

"In many localities these alluvial deposits contain sufficient cassiterite to be mined profitably, but long before the water-sorted gravel is reached the wolfram has ceased to appear, although it is derived from the tin-bearing lodes, in which it is invariably the predominant mineral."

That may not have been his meaning; the worst of such writing is not its ungainliness but its obscurity. It may not be intended to be beautiful, but it certainly is intended to convey information, and in that it fails.

(79) "In a cross-cut on the 14th level in ground to the east of the main drift along the line of the larger ore shoot a vein of quartz was struck, which on being followed soon developed values, and further on extraordinary values."

Would you think of engaging the services of an engineer showing so little intelligence? He may have meant to say:

"On the 14th level a cross-cut going eastward from the main drift, that is, the one along the line of the larger ore-shoot, struck a vein of quartz, which, on being followed, began to show ore and a little farther yielded ore of extraordinary richness."

(80) "There has never been any doubt that the problem of dry concentration would some day be solved and its present successful *advent* should not be passed by without at least an investigation."

Was it the "advent" or the "problem" that merited attention? How does one 'pass by' an 'advent' even in the dark?

"It never was doubted that dry concentration would some day prove successful, therefore this latest experiment is well worthy of attention."

Use words so that each one may be significant. We keep different tools for different kinds of work, thereby gaining efficiency. Keep each word to its allotted task. Do not dull the edge of a chisel by using it as a screw-driver.

'Differentiate' refers to a physical process of becoming different; it is not a correct synonym for 'discriminate' or 'distinguish'.

(81) "It would not be fair to *differentiate* [discriminate] against him."

'Designate' is to specify or particularize, not to choose, appoint, or name.

(82) "He *designated* [appointed] Jones foreman."

'Visualize' is to make visible, not to imagine, see, describe, or illustrate.

(83) "He was unable to *visualize* [imagine] the horrors of War."

'Discount' is to deduct from an amount or make allowance, not to expect, anticipate, or offset.

(84) "The manager *discounted* [anticipated] the caving of the stope."

These examples should serve as warnings to the engineer, who nowadays makes a fetish of efficiency and writes articles upon it in ineffective language.

An American provincialism that is gaining ground is the use of a geographic noun as an adjective, thus:

(85) "A *California* [Californian] mining engineer."

(86) "The *Alaska* [Alaskan] method of drift mining."

Our daily papers show such head-lines as 'Good Italy Harvest'; 'Great Albania battle'; 'U. S. Victory'. In these the corresponding adjective is desirable: Italian, Albanian, American. Undoubtedly newspaper usage is corrupting; technical writers should take care not to copy the habits of the illiterate.

Careless writers, with a fondness alike for the abstract word and the unnecessary plural, also show a preference for vague terms when precise ones are available. They use the present participle of a verb in place of the noun itself; thus

| | |
|----------------|----------------|
| capping | instead of cap |
| cropping | " " outcrop |
| filling | " " fill |
| faulting | " " fault |
| heavy stulling | " " big stulls |

(87) "A *capping* [cap] of leached monzonite covers the ore."

(88) "There *are* [is] no *cropping* [outcrop] of the vein to guide the prospector."

(89) "The *fillings* [fill] in the old stopes can be milled at a profit."

Abstraction is carried to inanity by scribblers who change

| | |
|------------|---------------------|
| nations | into nationalities |
| authors | " " authorities |
| events | " " eventualities |
| persons | " " personalities |
| characters | " " characteristics |

"It is well to look askance at words ending in 'ism', 'istic', and 'ization', for "they come of a vacuous tribe."²

Technology knows no political boundaries. The part of it written in English goes round the world. We exchange freely with the British and their cousins overseas. The English language is the common heritage

²Allbutt. Op. cit. Page 144.

alike of the American and the Briton, both of whom debase it with vulgarisms and colloquialisms that are understood only locally or regionally. In order that technical literature may pass current wherever our language is spoken, and even in foreign countries where it has to be translated laboriously, it is our duty to discard local terms or provincial phraseology. For example, 'reef' as used for 'lode' in Australia and 'ledge' as used for 'vein' in California are both objectionable terms. An orebody underground has no resemblance to the rock that imperils navigation, nor does a vertical outcrop resemble a shelf.³ The Australian put his 'mullock' [waste rock] in a 'paddock' [enclosure] while the American puts his 'dirt' [ore] in a steel 'tank' [bin]. The 'mullocker' at Bendigo is equivalent to the 'mucker' at Tonopah, and each is a 'shoveler' in good English. I need not multiply examples of bucolic terms and incongruous localisms. They disfigure technology and obstruct scientific thought. Why should a scientific man—for that assuredly describes the mining engineer—go to the illiterate workman for his terms? If you wish to learn how to break rock ask the Cornish or the Italian miner, by all means, but if you wish to use the delicate instrument of expression accurately ask those who are trained in the art. As graduates of a university you are expected to obtain your terminology from the library, not from the stope; you should shape your phraseology on that of the college, not on that of the bunk-house.

(90) "These *tanks* [steel bins] have proved satisfactory, especially to the mill-men, who are relieved of all ore-bin *mucking*."

He means that they are relieved of the labor of shoveling inside the ore-bin.

Such adoption of local vulgarisms by careless writers may be defended by shallow critics as one phase of that absorption of new elements by which a language grows. Of course, the English language is a living organism fed continually out of the varied human experience of our peoples—the American and British predominantly, but also the others who speak it across the seven seas. All of which in no wise excuses a literate engineer in displacing recognized technical terms by half-baked provincialisms.

To write well you need self-restraint—a grip on yourself. The notion prevails in some quarters that it is effeminate to use words with nicety, that the practical man is expected to fling them about him with careless vigor. That is a mistake. An educated man is disciplined in words as in conduct. Indeed, the self-discipline of writing is a splendid training for any engineer. It teaches him how little he knows accurately, and spurs him to gain a more thorough understanding. The turbid pulp in a mill is made clear by passing through classifiers and settlers, so that the metallic particles are separated as a clean assorted product. Similarly ideas, odds and ends of information, stray bits of observation, if passed

through the mind in the act of writing are co-ordinated, classified, and systematized into workable shape, into definite form, ready for immediate use.

In technology we should try to keep each term for a specific duty.

'Locate' and 'location' should be restricted to the delimiting of a claim. If we use these words in other senses, we cause confusion.

(91) "He *located* the mill on Deer creek."

Did he 'locate' a mill-site or did he build a mill on the creek?

(92) "The superintendent *located* [found] the ore-shoot on the fifth level."

(93) "He is now *located* at Silverton."

"He lives at Silverton now."

(94) "The mine is *located* in Northern Rhodesia."

Delete 'located', or substitute 'situated'.

'Carboniferous' and 'carbonaceous' have different meanings. They should not be used interchangeably. 'Carboniferous' referred originally to the geologic division of time associated with the formation of coal, but all Carboniferous strata do not contain coal. It is now simply the name of a geologic period, and is given a capital 'C'. 'Carbonaceous' means carbon-bearing, or containing carbon; it may be used to describe a black shale. A rock may be both Carboniferous and carbonaceous, as in Missouri, where a limestone belonging to the period immediately succeeding the Devonian is black with the product of decomposed vegetal [not 'vegetable'] remains.

'Calcining' and 'roasting' are not synonyms. The first should be applied to a process for removing carbon di-oxide from carbonates, such as limestone, or for dehydrating a hematite ore; the second should be restricted to a process for the expulsion of sulphur by heat in the presence of oxygen.

'Tank' is a term sadly over-worked. It means a large vessel used for storing liquid. A large vessel employed for conducting a chemical process may better be called a 'vat'. This distinction is not often observed, but it can be made to advantage in technical writing. Lately the word 'tank' has been used for a cylindrical steel ore-bin. This use only serves to confuse. An engine of war lately devised has been called a 'tank', although it is more like a glyptodon or some other monster of the primeval slime. We can forgive the men in the trenches anything, but not the metallurgist that calls an ore-bin a 'tank', as if in mockery of these dry days.

A 'chute' is a sloping passage down which material is passed; a 'shoot' is an orebody of recognizable shape and inclination in a lode.

Those who consider such distinctions of no consequence will call a machine for getting rid of slime a 'slimer', ignoring the fact that the suffix 'er' indicates an agent, so that a 'slimer' is a thing that makes slime. The process of 'de-sliming' is conducted on a 'slime-table'. The same scribbler would talk of 'dewatering' a shaft, ignoring the fact that we use 'unwater' to signify that operation, while we use 'dewater' to indicate the removal of

³A 'ledge' of oil-shale is correct, because the shale is nearly horizontal and projects from the face of a hill like a shelf.

excess water in a pulp. Again, consider the difference between 'recovery' and 'extraction'. In subjecting a copper ore to concentration the percentage of the copper in the concentrate is a 'recovery', but it is not, an 'extraction', for that is the work of the smelter. By using technical terms thoughtfully we increase our vocabulary; the careless use of words means the loss of distinct meanings; on the other hand, the discriminating use of words assists accurate expression.

'Section' is often used improperly. A section is a division of the public land containing 640 acres. It is also the view along an imaginary slice of anything, like a geologic section or the section of a machine intended to exhibit the interior. We ought not to use it as a synonym for 'region', 'district', or 'locality', as in:

(95) "The South-West is an arid *section* [region]."

(96) "In this *section* [district] the mines produce gold only."

Engineers should keep technical words for appropriate uses, otherwise they lose their special significance. A 'tunnel' is a gallery or bore that goes through a hill or mountain from daylight to daylight, as a railway tunnel does. A level that enters a mountain from the surface, to become the main artery of a mine or to drain the water from the underground workings, without going through to the other side of the mountain, is an 'adit'—a technical term used by miners from time immemorial.

It is well to note that mistakes are rarely solitary; like sorrows "they come not single spies, but in battalions." Let me impress upon you the fact that if you are careless about one detail—apparently unimportant—

you are likely to take no thought about others. Whether or not you accept my dictum concerning the use of this or that word or the rejection of this or that method of statement is of minor importance as compared with your acceptance of my general argument: that it is worth while to use words precisely and to build sentences logically. The man that learns to master the little words will acquire mastery over the big phrases. Genius has been called an infinite capacity for taking pains. The definition is incomplete, but it recognizes the first requisite of all good workmanship: the effort to be thorough.

MINE TIMBERS are subject not only to insect attack, but also, what is more important, to the action of gases and fumes that customarily occur in mines. These different destructive agencies cause the decay of the wood, and as a result it is only six or seven years, on an average, before such timbers become so weakened that constant repairs are necessary, even if they do not need to be replaced. It has been found that the life of the timbers can be doubled and even trebled by coating them with a creosote compound that fills all the pores on the surface of the timber and thus prevents gases and fumes from reaching the wood. The coating is a simple process, is not expensive, and tends to eliminate repairs to the timbering of shafts and other mine passageways that have a comparatively long life.

ANACONDA output of copper for June amounted to 10,500,000 pounds, against slightly in excess of 24,000,000 for the corresponding month of last year.

CURVES SHOWING THE PRINCIPAL FEATURES OF THE COPPER INDUSTRY FROM 1907 TO 1918. THE FIGURES FOR SECONDARY COPPER IN 1918 ARE NOT YET AVAILABLE

Carnotite in the Gateway District of Colorado and Utah

By DWIGHT FARNUM

Gateway, in Mesa county, Colorado, is merely a post-office at a ranch situated in the valley of the Dolores river, near the mouth of its tributary, West creek. The valley, and consequently the surrounding country, which I will designate as the Gateway district, is practically virgin because I was told that the first white settlers entered the valley less than twenty years ago. The post-office is the terminus of an automobile stage-line operating from Grand Junction and Whitewater, both in Colorado, on the Rio Grande railroad.

The Gateway district covers an area of about 15 miles square, extending into Utah as far as the Beaver Creek rim, and consists chiefly of high mesa, having a topography of successive terraces cut deeply here and there by canyons and dry gulches, all of which lead down to the Dolores river. It is an arid tract, every one of the few springs being well known and protected from destruction by wild animals or cattle. There are small areas of a dense growth of piñons and cedar.

Briefly, the geological formation of this district is sandstone of a calcareous nature in the upper strata and ferruginous in the lower, and a silicious limestone. There are three distinct strata of sandstone and the lower dark red stratification being exposed near the valley-level assumes many striking appearances. One of these is a natural double gateway, of vast proportions, through which the Dolores river and West creek flow before uniting. From a point upon the mesa, the view down one of the canyons is of indescribable beauty, as the intense green of the valley is framed within the dark-red perpendicular walls of the Gateway.

Carnotite is the only mineral exploited in the district and although it is associated with the three principal sandstone strata, the most important deposit is the one associated with the middle one, known as the La Plata sandstone. The ore occurs in blanket formation, slightly inclined from the horizontal; it averages two and one-half feet in thickness and lies just above the limestone. It is practically a contact deposit and underlies the whole district. This impregnated sandstone is not uniform in character or quality, and therefore cannot be mined 'just as it comes', nor without considerable experience. The ore rich enough to ship occurs in pockets, as is characteristic with most infiltrated formations. A pocket has been known to produce a carload of commercial ore, but most of them will yield a few sacks, or a ton at most. A miner may do days of 'dead work' after cleaning out a pocket and suddenly open up another, while on the other hand a few shots may expose another pocket of large or small proportions. The ravines cutting the strata

throughout the district expose the same ore-formation for miles and it is along the outcrops that the claims have been staked and the prospect-holes and tunnels have been driven. The sandstone is easily worked, though hard on steel and picks. Light blasting is required, the lower grade ore, including some limestone, being removed underneath while the richer grade is picked down upon canvas to save the fine.

The ore is generally of a dark-brownish appearance, colored here and there with light-yellow patches and streaks along the seams and cracks showing the result of

MAP OF PART OF COLORADO

changes due chiefly to weathering. Color does not seem to be a desirable means of estimating the contents of the ore, as similar pieces have shown widely varying percentages of uranium and vanadium.

Unfortunately the man accompanying me, and for whom I sampled several workings, insisted on mailing the samples to his office. I learned that the "pretty pieces" had been analyzed and distributed to the public. Therefore I cannot give the reported results, as they are of no value. However, I estimate from what I learned through talking with the several persons engaged in mining and shipping the ore that it will average $2\frac{1}{2}\%$ U_3O_8 . I was told that the vanadium ore, so-called, averaged

4% V_2O_5 but was thrown over the dump, as the buyers would not take it, and that 10% U_3O_8 and 8% V_2O_5 were often found.

Most of those engaged in the industry are ranchers, who develop their claims between times, getting out small sacked shipments occasionally, but at present they are at the mercy of the ore-buyers, who represent either Eastern firms, a Western sampling-works, or some unprincipled promoter. These miners, who operate in a small way, told me that the ore-buyers make a pretense of abiding by "fair sampling" of the shipment, (a grab sample is taken out of odd sacks in the presence of the shipper at Whitewater, Colorado, on the D. & R. G.). The buyer pays an estimated percentage, cash, to the shipper on the uranium content of the ore, but no consideration is taken of the vanadium content, much to the profit of the ore-buyer. The final payment is made on the buyer's analysis.

The so-called mines are 7 to 15 miles from the Gateway post-office, where the ore is brought in sacks by pack-train over difficult trails and stored, for shipment by automobile 47 miles to Whitewater.

It appears, from the pockety nature of the ore, which necessitates a large amount of dead work; from the fact that portions of the outcrop have been covered by slides; from the great distances, the scarcity of water, and the present means of marketing the ore, that carnotite will not be mined by individuals or companies on a large scale in this district except as a means of obtaining the ore for individual use, as is done at present by two or three companies whose operations have not reached large proportions, but generally have begun with an open-cut, with continued slicing and caving, until a method of tunneling similar to the room-and-pillar of coal mining has proved necessary on account of the depth reached in following the ore.

If the different individuals who own claims and all those interested in mining carnotite in the Gateway district would co-operate, and form an association, they could get out their irregular shipments and employ an agent to protect their interests so that the ore could be properly sampled, sold for the double content, and shipped in carload lots. Such an association would attract other small operators into the district. Mining of this nature is similar to 'pocket-hunting' in California, for it can be engaged in intermittently with profit, because no great amount of capital is tied up and the co-operation of the small miners and prospectors would ensure a respectable tonnage of ore.

A TOTAL of \$5,031,500 in gold coin has been withdrawn from the subtreasury for shipment to foreign countries. Gold coin to amount of \$1,200,000 in addition to that previously reported as withdrawn from subtreasury has been withdrawn for shipment to Spain and \$156,500 in gold coin to South America. Total withdrawals of gold coin from subtreasury and gold bars from United States assay office aggregate \$91,643,000 since gold export embargo was lifted.

A Hanger for Plans and Maps

By H. E. CLAYTON

The survey office in which I was working had a small amount of space available, and when it became necessary to examine several plans at once, the task was difficult. Consequently the plan-hanger shown in the sketch was devised and fitted with blueprints of all plans in current use. It carries a large number of plans (twice the number of sticks that can be placed on the iron pin), and

has the merit of folding up compactly against the wall when not in use.

The principal support is a piece of 3 by 2-in. timber 4 ft. long, which is affixed to the wall. An iron pin $\frac{5}{8}$ in. diam., with two shoulders shrunk on, is made as shown in the sketch; this pin, being threaded at the lower end, is bolted through the timber six inches from the end with one shoulder bearing against the wood while the other serves as a support for the screw-eyes in the ends of the sticks that carry the plans. The sticks are one inch square and of a length suited to the plans, in the present instance 5 ft. In the end of the stick is a screw-eye that slips over the iron pin. These screw-eyes are separated by 2-in. ferrules cut from $\frac{3}{4}$ -in. pipe. Finally, strings or wires, leading from a screw-eye near the top of the timber support, are fastened to screw-eyes placed about four inches from the end of the sticks on the rear side (B). Two blueprints, back to back, are then attached to the front side of the sticks (A) with drawing-pins.

Thus it will be seen that as each stick is swung back like the leaf of a book, two plans are disclosed. This is an advantage when the plans have a relation to one another as shown in the sketch.

AN American Petroleum Institute has been formed to promote co-operation between the industry and departmental or legislative organizations of the Government.

Production of Copper

By B. S. BUTLER

SMELTER PRODUCTION

*The smelter production of primary copper in the United States during 1918 was 1,908,500,000 pounds,

*Advanced statement issued by U. S. Geological Survey.

which, if compared with the production in 1917, 1,886,000,000 lb., shows an increase of 1.17%. The total value of the output in 1918, at an average price of 24.7 cents per pound, is \$471,408,000, against \$514,911,000 for 1917.

In the following table the production is apportioned to the States in which the copper was mined. The figures

†The average price of 2,283,500,000 lb. of copper delivered in 1918, as reported to the U. S. Geological Survey by selling agencies, was 24.683c. per pound.

a The separation of refined copper into metal of domestic and foreign origin is only approximate, as an accurate separation at this stage of manufacture is not possible.

b Some Lake copper was refined at seaboard plants and doubtless marketed under some brand other than Lake. This has been excluded from the Lake copper.

c Includes refined copper imported.

represent the content of fine copper in the blister produced and the smelter output of ingot and anode copper from Michigan.

REFINED COPPER

The total production of new refined copper in 1918 was 2,432,000,000 lb., an increase of 4,000,000 lb. over that of 1917.

The reports from plants that treat secondary material exclusively are incomplete at this date. A statement of the secondary production will be published as soon as the figures are available.

In addition to their metallic copper the regular refining companies produced bluestone having a copper content of 7,917,696 pounds.

STOCKS

Returns from all producing companies show that their stocks of electrolytic, Lake, casting, and pig copper on hand at the beginning and end of the year were as follows:

STOCKS OF REFINED COPPER

| | Pounds |
|----------------------|-------------|
| January 1, 1919..... | 180,000,000 |
| January 1, 1918..... | 114,000,000 |

Increase during 1918..... 66,000,000

In addition to the stocks of refined copper on hand January 1, 1919, 562,600,000 lb. of blister copper and material in process of refining were reported as at smelters in the United States, in transit from smelters to refiners, and at refineries, against 411,000,000 lb. on January 1, 1918. This does not include copper in stock at foreign smelters or in transit from foreign smelters to refineries in the United States.

CONSUMPTION

The apparent consumption of refined new copper in the United States in 1918 was 1,662,000,000 lb. In 1917 it was 1,316,000,000 lb. The method employed in determining the quantity of copper retained for domestic consumption is shown in the following table, which does not include stocks of copper held by consumers:

APPARENT DOMESTIC CONSUMPTION OF REFINED NEW COPPER IN 1913, 1914, 1915, 1916, 1917, AND 1918, IN POUNDS

| | 1913 | 1914 | 1915 | 1916 | 1917 | 1918 |

^b Exclusive of manufactured copper.

New Cornelia

The New Cornelia Copper Co. is constructing an experimental flotation plant which it expects to complete by the first of next September. This new addition is not being erected, however, for an immediate increase in copper production, but rather to give the company adequate facilities for the thorough experimentation of some of its semi-refractory ores. At present the company is operating all departments at about two-thirds capacity. It is keeping one eye on the copper metal market and one on the capacity gauge of the property. On 24 hours notice it can get back to full capacity. Indeed, it will be easier for New Cornelia to get into its full stride than for the deeper mines, as labor is not such a great factor in the operation. The company is preparing now to strip quite an extensive body of high-grade ore. This will be uncovered by steam-shovel instead of underground operation and at an obvious saving in time and expense. New Cornelia had its second birthday last month.

In June 1917 it made its first shipment of commercial ore and since that time has obtained an average extraction of 80% of the copper content of its ore. Without allowing for depreciation, depletion, or a reserve for excess profits taxes, the company is 'making' its copper today for approximately 13c. per pound. It has sold a substantial amount of its surplus metal, yet has held back enough to take advantage of the present market at 20c. Now that the metal market has begun to approach a level where something more than a new dollar for an old can be made, it is logical to expect New Cornelia to resume dividends on its 1,800,000 shares of stock. Last November it inaugurated payments with a distribution of 25c. per share. Right after, the copper market went into the doldrums and, of course, New Cornelia has paid nothing since. Of its total outstanding capital, Calumet & Arizona owns 1,200,000 shares, or 70%, and this latter company has been the guiding hand that has led New Cornelia so rapidly to success.

ARIZONA

COPPER QUEEN POWER-LINE.—DENN-ARIZONA MINE.—
SILVER VIRGIN DEVELOPMENTS.

BISBEE.—Plans for the construction of the Copper Queen concentrator near Warren, to handle the output of low-grade ore from Sacramento hill, are being worked

out in detail by H. Kenyon Burch, and it is anticipated that the company will be in position to call for bids within the next 30 days. No details in connection with the mill have been made public yet. The power-line from the Copper Queen smelter in Douglas to the company's properties in the Warren district is one-third completed and will be ready for operation about October 1. The

MAP OF ARIZONA

steel towers on which the power-transmission lines will be strung will form a direct line between Douglas and Bisbee. The towers are only about 100 yards from those carrying the Calumet & Arizona power-line, erected several years ago. The Copper Queen line will be supplementary to the power-plant at Bisbee, the increase in power being necessitated both by present large operations and increases planned for the future. The power-house of the Copper Queen smelter, in addition to supplying current for the operation of the big reduction works, supplies the city of Douglas and, by means of a power-transmission line 70 miles in length, drives the mine and mill machinery of the Lucky Tiger company at El Tigre, Sonora. Silver leases on the Copper Queen properties at Tombstone continue to be sought eagerly and there has been considerable increase in the number of lessees at work there within the last few weeks. This has given rise to reports that the company intended to resume work on its properties at Tombstone on a large scale, but this is denied. Only a small force is at work on company time, getting out low-grade ore used as a flux.

L. C. Shattuck, managing director of the Denn-Arizona mine, has announced a strike of more than usual importance on the 1700-ft. level. The extent of the orebody has not been fully determined, but at present more than 3000 tons has been blocked out. Assays show silver and gold in addition to the copper. Because of the increase in mineralization with depth, it is the intention of the company, after finishing the development of the 1700-ft. level, to drive on the 1800 to develop the extension of the orebody believed to be there. Larger pumps, however, will have to be installed before the plans for development below the 1700-ft. level can be carried through. At present the pumping equipment is handling 800 gallons per minute. The Denn mine came into the hands of the Shattuck-Arizona interests in 1906 and up to date more than \$4,000,000 has been expended upon its development. During the war period it produced half a million pounds of blister copper monthly, but for several months it has made small shipments owing to concentration of the working force on development. This policy has proved effective in the development of the new orebody, which not only is important to the company, but also to the entire Warren district, by proving that the mineralized zone extended farther east than had been proved previously.

DOUGLAS.—The Silver Virgin Mining Co., a Douglas corporation operating at Ajo, has opened an excellent orebody on the 100-ft. level, according to J. J. Adair, superintendent, who came here recently. He brought with him selected samples which run high in silver. The property is in the Quijotoa mountains 85 miles northwest of Tucson. The west drift on the 100-ft. level has broken into lime, and by cross-cutting it is expected to break into the orebody already developed by a drift extending southward from the shaft. Mr. Adair states there is 10,000 tons of ore proved carrying an average of \$56 in silver at present market prices. The company was incorporated here a few months ago under the laws

of Arizona with a capitalization of \$150,000. The officers and directors are: A. B. Murchison, president; Joseph F. Deitrich, vice-president; S. W. White, secretary; Fred E. Cadwell, treasurer; J. J. Adair, superintendent; J. E. Shaw and H. D. Maynard. It is planned to construct a mill in the near future. An excellent road leads from Tucson through the Papago Indian reservation to the property.

COLORADO

GENERAL NEWS OF CRIPPLE CREEK AND LEADVILLE.

CRIPPLE CREEK. Stock transfer books of the Portland company closed July 12 preparatory to the payment of the regular quarterly dividend of 2 cents per share, which will amount to \$60,000. The company is mining ore from two rich and strong shoots at the Roosevelt tunnel level, from the Lee 5 and Portland No. 2 veins. The depth is 2131 ft. from the surface. Net profits of the Cresson company for May, as shown in the July report of A. E. Carlton, the president, were \$60,546. In concluding his monthly report Mr. Carlton stated "The labor supply, while somewhat improved, is not yet satisfactory and 63% of the production in May came from broken sources." Al Osberg and J. S. Christiansen have purchased the Tambourine group at Wall Street in the Boulder County mining district, one of the oldest and best known producers of that district. A contract has been made with the Golden Cycle Mining & Reduction Co. at Colorado Springs for the treatment of the Tambourine ores, and production is already well under way. The Anderson and Benkelman lease of the Trail mine of the United Gold Mines Co., one of the most profitable both to the operators and the owning company in the history of the district, has but four months to run, but it is estimated that although there remains 300 feet of cross-cutting to tap the ore-shoot, the cost will be more than paid for in the first 30 days, thus leaving three months for profits even should no extension be secured. Anderson, Benkelman, Eby, and Orrison, partners in the lease, have all made fortunes from the ore sales, while the United Gold Mines Company has secured more than \$110,000. The Beacon Gold Mines Co., H. M. Gilbert manager, continues shipping high-grade ore from its lease of the Index mine of the El Paso Extension Gold Mining Co. The leasing company is shipping about three cars per week and the ore is reported to average \$40 per ton. The Rose Nicol mine on the north-west slope of Battle mountain, owned by the Rose Nicol Gold Mining Co., and operated under lease by the Reva Gold Mining Co., is shipping about 100 tons per week. The settlements are stated to be from \$20 to \$30 per ton. Two shoots are furnishing the ore, one on the eighth and the other on the ninth level of the main Rose Nicol shaft.

LEADVILLE.—Stilwell Conner, a former successful Cripple Creek operator now leasing the properties of the Pearl Consolidated Mining Co., will soon commence shipping to the Leadville smelter. The Pearl Con. property is at Buffers, near Climax, in the strip in litigation be-

tween Lake, Park, and Summit counties, and has long lain idle. Mr. Conner determined to prospect a narrow vein of ore showing in the lower tunnel, which had been driven to cut the vein and shoot that produced heavily in the shallow shaft workings, but which had apparently missed the vein in depth. He followed this streak and it widened with every round, until he is now breaking seven feet of ore with the foot-wall only exposed. Samples are reported from 20 to 36 oz. silver per ton. Last week he visited Denver and made satisfactory arrangements with the Colorado & Southern Railroad for the reconstruction of the loading switch, which will enable him to ship at least a car per day to the Leadville plant. He has also sampled the old shaft dump and estimates there are 400 to 600 tons of ore available that will average 23 oz. silver or better per ton. This ore will be sorted and also shipped. The Bowman group in the Red Mountain district will soon be shipping to the Leadville plant. C. Harvey, the lessee, has opened up a strong vein by tunnel. The Wolfstone in the same district has been reopened after long inactivity and is producing sulphides and carbonate of zinc. The company has contracted to deliver several thousand tons of the ore before the end of the year. J. H. Samm, operating a property owned by him on the south-western slope of Mt. Massive, has cut a strong vein of gold ore that is reported to average \$6 per ton over a width of 10 ft. A trial shipment is to be treated to test the ore thoroughly and if results are satisfactory a cyanide plant will be constructed.

MICHIGAN

MINES HIRING UNDERGROUND MEN.—PRODUCTION FOR JUNE.

The operating mines in the Copper Country, including the Calumet & Hecla, Isle Royale, Quincy, Mohawk, Osceola, Ahmeek, Champion, Trimountain, Baltic, and Allouez, are adding underground men, principally miners and trammers, to their working forces, and it is expected that the total personnel will be increased 3000 men by the end of August. The first openings are being given to former employees, either underground or surface. It is quite generally understood, however, that this change of policy in employing men does not foreshadow any immediate increase in the production of copper, nor does it mean any increase in the number of surface men. The additional men will be put to opening new ground wherever possible. Calumet & Hecla and its subsidiaries do not intend to produce over 50% of normal, and it is not expected that the others will exceed 80% of normal for the present. The change of attitude on the part of the largest producers in the district reflects, however, the marked betterment in the outlook for the copper market, and has been received with pleasure throughout the district. The general belief seems to be that the situation has turned for the better, and that the turn is a permanent one for future prosperity. There has been a noticeable return of workmen to the district, but it will be some time before the returning men equal those who left during the slump in the copper market last winter and spring.

The production of ore from some of the principal mines during June is as follows: Champion, 36,000 tons; Baltic, 19,000; Trimountain, 15,500; Wolverine, 21,800; Mohawk, 44,000; Michigan, 5320; Mass Consolidated, 6082; Osceola Consolidated, 46,000; Ahmeek, 36,000; Centennial 4500; Allouez, 8700; Isle Royale, 40,000.

NEVADA

GOLDFIELD, CARSON CITY, DENIO, INLAY, TUSCARORA.

GOLDFIELD.—Ore sampling \$15 to \$22 per ton is showing across the entire face of the main drift and stope on the 200-ft. level workings of the Red Top mine of the Goldfield Consolidated, now operated by the Goldfield Development Co. A single blast recently shot down 3000 tons that sampled \$67,200. At this point ore-reserves of 200,000 tons have been estimated to average \$7 per ton. The management is planning to increase the capacity of the Consolidated mill to 2000 tons per day, and to place the plant in commission early in August at its present capacity of 1200 tons. Two ball-mills and other equipment will be sufficient to increase the tonnage to the desired point. The company is preparing to work extensively the north half of the Florence-Goldfield, recently taken under lease, and the mill for several months will operate principally on ore from the Red Top, Florence, and Mohawk. Meanwhile the cross-cut from the main drift on the 380-ft. level of the Combination mine is nearing its objective. With its completion arrangements will be made to work the 1,500,000 tons of low-grade ore in the Combination by the caving system. It is estimated 2,200,000 to 2,500,000 tons of ore is exposed, representing approximately \$11,000,000 to \$12,000,000. Late work in the Red Top and Mohawk proves the ore will run better than the average grade indicated. A. I. D'Arcy is manager and F. Dean Bradley mill superintendent.

CARSON CITY.—The vein recently opened on the Southwest Comstock, seven miles south-west of Virginia City, has widened to five feet of \$50 silver-gold ore. It has been opened to a depth of 70 ft. and prospecting has shown that ore occurs on both sides of the walls. Copper has almost entirely disappeared and the gold content is steadily increasing. The ore is declared to be typical of that found on the Comstock Lode in surface workings. Arrangements are being made to increase the force and carry on development on a broader scale. Thurman Roberts is president and Walter Baldy secretary. Comstock Superior has started work on ground adjoining Southwest Comstock on the north-east. The formation is the same character as that occurring on the Southwest Comstock, and the owners expect to intersect the Roberts vein at shallow depth. Somewhat further toward Virginia City, ground has been acquired by the Eagle Comstock Co., in which Canadian people are interested. G. S. Clack, of Reno, is manager. Several groups of claims have been located since discovery of the Roberts vein, and preparations for much prospecting are being made by Reno and Carson City people.

DENIO.—D. C. Pomeroy reports discovery of a large deposit of gold ore in his Deegan & Cowden mine. At a

depth of 50 ft. the vein was opened by a drift and stated to be of milling grade with the ore the full width of the drift. Construction of a small mill has begun.

INLAY.—Arthur Perkins and A. E. Springer have taken under lease and option the Santa Clara silver-gold group near Inlay. The property was a good producer when known as the Michigan Nevada. It is owned by Warren & Hawkins of Winnemucca.

TUSCARORA.—The Holden Mining & Milling Co. is erecting a 50-ton experimental mill on its property in this district. The plant will start work soon and a large mill is to be installed as soon as a suitable process for ore treatment has been determined. Developments are principally restricted at present to the Nevada Queen mine, formerly a large silver-gold yielder. C. C. Griggs is general manager. The Rose group has been purchased by F. L. Reber and associates of Winnemucca for \$10,000 and a stock consideration. The property has been sufficiently worked to expose a strong vein of ore said to be of shipping grade. Extensive work is to start at once.

BRITISH COLUMBIA

NEW TREATMENT CHARGES AT THE TRAIL SMELTER.

Reference has been made to the dissatisfaction of the independent shippers of British Columbia with the treatment charges of the Canadian Consolidated Mining & Smelting Co. at its Trail smelter as set out in what is known as Schedule B. This, it will be recalled, led to an investigation by a special committee, whose report was issued a short time ago. The matter was discussed at the recent mining convention at Nelson, when it was announced by J. J. Warren, the company's general manager, that a new schedule was being prepared and would be issued shortly. That schedule now has been published and is effective. It provides the promised reduction in ore rates and more especially affects those ores containing zinc and sulphur. The schedule is as follows, the introductory table being the basis of payment for silver and lead:

| | | Silver payment, | Lead payment, |
|----------------------------------|--|--------------------|------------------|
| | | % | % |
| 10% zinc or under..... | | 95 | 90 |
| Over 10% and including 11% | | 94½ | 89 |
| " 11 " " 12 | | 94 | 88 |
| " 12 " " 13 | | 93½ | 87 |
| " 13 " " 14 | | 93 | 86 |
| " 14 " " 15 | | 92½ | 85 |
| " 15 " " 16 | | 92 | 84 |
| " 16 " " 17 | | 91½ | 83 |
| " 17 " " 18 | | 91 | 82 |
| " 18 " " 19 | | 90½ | 81 |
| " 19 " " 20 | | 90 | 80 |
| " 20 " " 21 | | 89½ | 79 |
| " 21 " " 22 | | 89 | 78 |
| " 22 " " 23 | | 88½ | 77 |
| " 23 " " 24 | | 88 | 76 |
| " 24 " " 25 | | 87½ | 75 |

Silver will be paid for on the fire-assay at the average of the quotations for the second calendar month succeeding the date of sampling at Tadnac, B. C. In no case will

the deduction from the silver assay be less than one-half ounce per ton.

The lead contents will be determined by the wet method of analysis, deducting 1½ units to arrive at the dry lead assay. Lead will be accounted for on the dry lead assay to the extent shown by the above schedule; provided, however, that in no case will the deduction be less than one unit, or 20 pounds, per dry ton of ore. The price for lead to be used in settlement will be the sales price delivered at destination in Canada less 1½ cents per pound for refining and marketing as in effect under the existing pooling scheme, which will be continued. There will be deducted also, from the delivered sales price, \$2.30 per ton on sales at Toronto and common points, \$4.50 at Montreal and common points, and similar differentials to other points. This freight adjustment is to cover actual increases in freights; for example, should sales in any month be 2000 tons and, say, 1200 tons for delivery at Toronto and 800 tons at Montreal, the freight adjustment would be three-fifths at \$2.30 and two-fifths at \$4.50, or \$3.18 per ton of lead.

The pooling scheme is outlined as follows:

(a) Settlement is based upon sales price as above provided and only to the extent of actual sales from month to month.

(b) Whenever sales are sufficient to settle for a full month's lead receipts this is done promptly.

(c) Lead from our own mines is pooled with that purchased from others and is treated in exactly the same way.

(d) Each month a statement is issued showing the condition of the pool. All shippers have been sent a copy of the last one issued.

The charge for smelting per dry ton of material is to be \$9.50 as a base rate, which will be modified in accordance with the following formula:

1. Add to the base rate per ton, 60c. per unit for all zinc contained.

2. Deduct from this result the total units of silica, iron, manganese, lime, and magnesia at 9c. per unit.

Provided that in no case shall said base rate be reduced more than \$4 per ton as the net result of the said additions and deductions.

Provided also, that in making the above computation, iron, silica, and lime if 1% or under, and manganese and magnesia if 3% or under, will be disregarded.

A charge will be made in addition to the above for all sulphur contained in excess of 2%, at 30c. per unit per dry ton of material, provided that such charge shall not exceed \$3 per ton in any case.

A minimum moisture deduction of ¼% will be made. The following penalty for moisture will apply to fine concentrates and clayey ore only. If over 5%, the charge for all moisture contents is to be 10c. per dry ton per unit.

Coarse and fine concentrates and ores should be shipped separately. If mixed so that over 30% will pass through a ¼-inch screen, an extra charge of 50c. per ton will be made. If the shipment is less than a car lot or contains more than one lot per car, a deduction may be made for extra sampling, assaying, etc., of \$10 per lot.

THE MINING SUMMARY

ARIZONA

Bisbee.—The management of the Shattuck-Arizona Mining Co. reports that a strike of considerable importance has been made on the 1700-ft. level of the Denn mine. The size of the orebody has not yet been determined, but it is estimated that there are two or three hundred thousand tons of high-grade ore. The main shaft has been sunk to the 1800-ft. level, but the large volume of water encountered has delayed development.

Phoenix.—The Kay Copper company will build a 1000-ton concentrator at its mine in the Black canyon, about 50 miles from Phoenix. George W. Long is manager. F. A. Gillespie of Tulsa, Oklahoma, and his son, B. A. Gillespie, will build a large mill at their Red Rover mine, situated 50 miles north-west of here.

Tucson.—Silver-lead sulphide ore has been opened in the main tunnel of the Sunshine No. 1 claim of the Aguajito property of S. W. Purcell in the Papago mining district. This strike is 160 ft. below the surface. A bond and lease for \$6000 has been taken on the old Dick Starr property six miles from Tucson, by Robert Hook and Mrs. Mary Hamshire. A 6-ft. vein of silver-lead sulphide ore has been opened up on the McKinley claim of the Banner group of mines in the Papago mining district. A Mexican has leased this property from Hereford and Hubbard, who are developing several properties in this district and operating a 15-ton mill.

CALIFORNIA

Nevada City.—Judge Jones of the Superior Court has handed down an opinion in the case of the Byron Jackson Iron Works of San Francisco against A. W. Hoge et al, recently tried here, and offers the suggestion that an amendment of the complaint is necessary in order that a value may be placed on each piece of machinery and with the same privilege to the defendants.

Nevada County.—G. H. Burnham, Deputy U. S. Marshal, has, in pursuance of an execution issued out of the United States District Court for the Northern District of California, levied on the personal property of the El Oro Mining Co. near Lake City. The proceedings are based on a judgment obtained by the Government because of non-compliance with the explosive storage law. The Government proved explosives had been stored at the mine without a license. The judgment is for \$850, and if not enough personal property be paid to satisfy the claim the mine itself will be offered for sale.—A deed was placed on record last Friday whereby the large holdings of the Excelsior Water & Mining Co., owning land in Nevada, Yuba, and Placer counties, together with valuable water and mining interests, was transferred to the Interstate Land Holdings Co. The stamps make the consideration \$120,000. It is understood that the control still remains in the Ayer family of Boston.—The Blue Point mine has resumed operations at Smartsville.

Lars R. Jorgensen, engineer for the Marysville-Nevada Water Co., organized to build a restraining dam on the Yuba for hydraulic tailings and to develop the nearby waters for power below Bullard's Bar, has five applications for water appropriations before the State Water Commission

and has been allowed until September 1 next in which to file his map.

Plumas County.—The Standard Mining Co., operating two giants at the head of Nelson creek, near Johnsville, is preparing to raise its basket type of restraining dam to increase production next season.—The Feather River Gold Mines Co. intends starting immediately to reinforce and raise the dam on Jackson creek near Sloat. Its hydraulic operations were profitable this season.

Sierra County.—A cross-cut being driven in No. 6 tunnel of the old Sierra Buttes mine has encountered water, which is considered an indication that the vein is not far away. The present workings are 1500 ft. lower than a point where a good prospect was found some months ago, and renewed hopes are expressed that the cross-cut may intersect good ore.

Tuolumne.—The Carson Hill Gold Mining Co. earned net profits in June of over \$61,000. This is virtually the first full month that the property has had an opportunity to test its earning capacity. From the beginning of operations in January of this year to the last of May it was concentrating operations on development and gold production was secondary. Yet for the first half of 1919 final net earnings totaled close to \$250,000—and 70% of the ore treated was from development work. From 6843 tons of ore in June the company obtained an average extraction of \$13.83 per ton. Recent months showed an extraction in excess of 92%. Including charges of all kinds operating expenses in June amounted to only \$4.13 per ton. During the past three months, the company has cleaned off all debts incurred in its early construction with the exception of the \$600,000 loan from the American Zinc Co. It will pay off \$50,000 of this loan this month and by the fall the loan should be materially whittled down. Rapid strides are being made in the opening up of the Hill's newest level, the 875. A station has been completed at this depth, a cross-cut has been run to the vein and driving has been started. From primary operations this lowest level promises to be as rich or richer than the bonanza level above, the 675-ft. level, where for 140 ft. the ore averages \$47 per ton. This confirms the statement made by the manager, William J. Loring, that the vein which showed such value in the levels above would continue on to at least the 875-ft. level, to say nothing of below.

IDAHO

Central Idaho.—An important strike is reported at the Center Star mine, near the mouth of the Crooked river on the south fork of the Clearwater. About five feet of gold ore is alleged to have been encountered in the face of the vein.

Kellogg.—The installation of milling machinery is proceeding steadily on the property of the Nabob Consolidated Mining Co. It is believed the work will be completed in August. Stopes have been opened and underground work is proceeding. The plant will have a daily capacity of 150 tons and has been designed to concentrate the ore developed in the Denver claim of the company and in the original Nabob group. Ore has been followed on two levels of the Denver for about 400 ft. on each. The ore is stated to average about 10% lead and 16% zinc.

Mullan.—The Federal Mining company will re-introduce the contract system at the Morning mine. The general labor situation is reported improved, with more men being added to the crews employed.

Wallace.—The new Ajax mill on Pine creek will begin operations shortly. A crew of about 50 men are employed at the mine, and enough ore has been blocked out to keep the mill in operation for some time.

MONTANA

Butte.—The local companies have announced that they will pay a scale of wages to miners, craftsmen, and salaried men at the rate prevailing during the War; the same to date from July 1. This is an increase of \$1 per day for miners and craftsmen and 10% increase for salaried men, and is to be a flat rate not affected by the price of copper as heretofore. This rate to be effective is contingent upon the acceptance by the unions and is to hold for a period of one year.—An increase of \$3,000,000 in the capital stock of the East Butte Copper Mining Co. is announced in papers filed, making the company's total \$6,000,000. Oscar Rohn is manager for the company, which owns 114 acres in the Butte district, according to the statement. It gives the actual cash value of its property at \$5,178,919.52.

Sildex.—Reports from the Amazon-Dixie mine indicate that the development which Wesley Everett, the manager, has under way is bringing the desired results. The showings in the drifts from the bottom of the shaft, both east and west, are reported as showing a marked improvement, galena being scattered all through the lode the full width of the drift.

NEW MEXICO

Carrizozo.—The Jacks Peak Tramway & Mining Co. of Dalhart, Texas, is preparing to develop its iron ore beds, situated 30 miles east of here. It is constructing a tramway 8 miles long, to give the mine a transportation outlet to the Chicago, Rock Island & Pacific railroad. The company has a contract to mine and ship 200 tons of ore per day. N. M. Vinyard is president and general manager.

UTAH

Bingham.—The Utah Consolidated has resumed work on its main shaft, which will be sunk to the 2000-ft. level. The lowest workings are at present 1000 ft. Work was begun on this shaft several months ago, but was discontinued owing to the demoralized condition of the copper market.

Park City.—Mining conditions in Park City are gradually coming back to normal, and it is thought that with reasonable assurance that a raise in wages will be granted, many miners will come back and every property will soon have its full quota of men. Petitions for increases in wages have been signed by the employees at each property and it is thought the raises will be granted. In the case of the Ontario, it is understood that the raise was agreed upon before the petition was circulated.

Tintic.—Articles of incorporation of the Tintic Prize Winner Mining Co. have been filed with the country clerk. Springville is named as the principal place of business. The company is capitalized for \$100,000.

MEXICO

Sonora.—Flood water in the mountains between Esqueda, 35 miles south of here on the Nacozari railroad, and El Tigre, early in July, resulted in the washing out of the freighting road of the Lucky Tiger mine to such extent that the property was prevented for several weeks from reaching the railroad for shipment to the United States. The mine and concentrator kept in full operation, however, the concentrate and bullion being stored until the road opened again.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

D. C. Jackling is at Juneau.

George H. Sexton is here from New York.

G. F. Laycock has gone to Atbasar, in Siberia.

F. R. Weeks is in Montana on examination work.

James F. Kemp is at Butte in connection with the Elm Orlu lawsuit.

B. C. Yates, superintendent of the Homestake, is taking a holiday in Colorado.

E. D. McDermott has been appointed manager of the Cape Copper Co.'s works in India.

James E. Chapman, who has been spending a few weeks in Wisconsin, has returned to Picher, Oklahoma.

John W. Mercer, who has been American Red Cross commissioner in Switzerland, is expected shortly in New York.

Thomas T. Read has been added to the staff of the U. S. Bureau of Mines and is charged with the investigation of welfare work.

George J. Young is now resident in San Francisco as the editorial representative of the 'Engineering & Mining Journal' of New York.

A. F. Brock has been promoted from head surveyor to the position of Mine Engineer to the International Nickel Co. at Copper Cliff, Ontario.

George H. Morgan, Major of Engineers, has returned from service in France. His present address is care of W. H. Weed, 29 Broadway, New York.

L. S. Cates, formerly general manager for the Ray Consolidated Copper Co., at Ray, Arizona, has joined the staff of the Utah Copper Co., at Salt Lake City, Utah.

Edward H. Robie, assistant metallurgist to the International Nickel Co. at Copper Cliff, Ontario, has joined the editorial staff of the 'Engineering & Mining Journal' at New York.

Alfred H. Brooks, Lieutenant-Colonel of Engineers and Chief Geologist to the A. E. F., has obtained his discharge from the Army and expects to start for Alaska from Washington at the end of the current month. He will visit Anchorage, Juneau, and probably Fairbanks.

William G. Sharp, president of the United States Smelting, Refining & Mining Co., died on July 1 at his home in Wenham, Massachusetts.

WAR MINERALS CLAIMS

The American Mining Congress makes public for the first time the grand totals of claims filed against the War Minerals Relief Appropriation as follows:

| | Total of claims |
|-----------------|-----------------|
| Pyrates | \$2,764,377.04 |
| Manganese | 7,946,155.59 |
| Chrome | 2,594,271.30 |
| Tungsten | 1,720,498.85 |

Total\$15,051,302.78

These totals will be analyzed for members later. No action has yet been taken by The American Mining Congress looking to corrected legislation to meet the published opinion of Attorney General Palmer which appears to eliminate a large part of the claims, but a meeting of manganese producers called in Congress headquarters for July 18 was expected to advise as to the desire of producers and a program will be announced later.

THE METAL MARKET

METAL PRICES

San Francisco, July 22

| | |
|--|-------------|
| Aluminum-dust, cents per pound..... | 50—80 |
| Antimony, cents per pound..... | 8.50 |
| Copper, electrolytic, cents per pound..... | 23.50 |
| Lead, pig, cents per pound..... | 6.00—7.00 |
| Platinum, pure, per ounce..... | \$105 |
| Platinum, 10% iridium, per ounce..... | \$121 |
| Quicksilver, per flask of 75 lb..... | \$100 |
| Spelter, cents per pound..... | 9.50 |
| Zinc-dust, cents per pound..... | 10.00—12.50 |

EASTERN METAL MARKET

(By wire from New York)

July 23.—Copper is active and higher. Lead is strong. Spelter is active and advancing.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

| May | 74.61 | 99.50 | 107.23 | Nov. | 85.97 | 101.12 | ... |
| June | 78.44 | 99.50 | 110.50 | Dec. | 85.97 | 101.12 | ... |

Several factors are contributing to keep the market dull. Holders are firmly of the belief that present levels are only temporary; buyers seem to be equally convinced of the opposite view. It has been a dull season all around, and the heavy drop in sterling has helped to keep the market inactive. Both in London and New York stocks have been moderate, and are more likely to be replenished than otherwise in the near future. For some reason or other, the demand from the European neutrals has not been as large as was expected. It was thought that they would at least buy in London; but so far they have taken very little. The China market has maintained its improvement, but there is no special strength at the moment. The tendency is toward improvement, if the exports are maintained. Indian currency returns show a progressive increase in notes, with the reserve in silver, both in and out of India, practically unchanged.

COPPER

Prices of electrolytic in New York, in cents per pound.

Copper has sold for September delivery at 21½¢ per pound. Wire-mills have been the best buyers of copper, and wire quotations have been steadily advanced with the copper rise. Export copper takings have been in good volume for European and Far Eastern account. One of the large selling agencies is rumored to have sold on July 14 almost 10,000,000 lb. for August and September delivery at 21½¢ and 21½¢ cents.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. Prices, in dollars per flask of 75 pounds:

FOREIGN EXCHANGE

The markets continue to decline and no relief is yet in sight. Sterlings, francs, and lire all touched new low points. As is usual at this season of the year, there is a flood of bills, and unless there is some special support the rates are not likely to improve. Fluctuations are violent, shifting so rapidly that quotations at any one time are almost nominal. There is little prospect of support for francs, with sterlings at present low levels. Even credits to France will not help, because the continental rate still seems to be regulated from London.

The lire market is mainly controlled by speculation, conditions in Italy being so bad as to take the rates down to any level. The rates may improve temporarily when the shorts begin to cover.

Quotations on July 22 are as follows:

| | |
|-----------------------|-------|
| Sterling: Cable | 4.31% |
| Demand | 4.31 |
| France: Cable | 7.11 |
| Demand | 7.12 |
| Lire: Demand | 8.60 |

Gold. The Treasury statement shows the stock of gold money and bullion held in the United States July 1 was \$3,095,077,467, the highest point of the year. This is interesting in view of the fact that the combined statement of the Federal reserve banks as of July 3 showed a decrease in gold reserve since June 8, 1919, the Friday preceding removal of the gold embargo, of \$72,900,000 due to withdrawals. Gold stock on July 1 showed an increase of \$3,039,768 over June 1. As further bearing on the situation, the Federal Reserve Board said in its July bulletin: "Removal of the gold embargo has been followed by moderate shipments of gold, which, however, are much more than offset by gold either imported or shortly to be imported, and whose early arrival is certain. Foreign exchange has been in most cases weak and lower than during the preceding months, francs and lire being in a particularly unfavorable condition."

Eastern Metal Market

New York, July 16

All the markets are decidedly active except tin and prices are advancing, some rapidly.

Demand for copper is growing larger very rapidly and this is being reflected in successive price advances.

The tin market is still very quiet.

Demand for lead is better and quotations are higher.

The zinc market is becoming stronger each day on heavier demand, and prices are daily going higher.

Antimony demand is light and prices are unchanged.

IRON AND STEEL

Developments in the trade have been unusually favorable all the week and the indications are that activity will be sustained and perhaps cumulative the entire summer. The Carnegie Steel Co. is operating at 75 to 80% of capacity and a large independent interest at Pittsburgh is working at above 80%. At least a half dozen blast-furnaces are about to be blown in and the increase in bookings at rolling mills is calling for more pig-iron, the stocks of which have been steadily declining for more than a month. The June output of steel for the country is put at 2,640,984 gross tons or 105,639 tons per day as compared with 85,024 tons per day in May—a gain of 24%. Inquiry from all parts of the world is reported in export circles and no dullness is expected in this branch of industry. A Pittsburgh mill has booked 20,000 boxes of tin plate for Japan and much more is under negotiation.

COPPER

The prediction by Judge Gary of the U. S. Steel Corporation the last week in May that 20c. copper would rule in the near future has come true sooner than was expected only three or four weeks ago. The market is really advancing by leaps and bounds and higher prices are predicted. In the last week the market has advanced about 2c. per pound, 1.4 of this in the last day, electrolytic copper for July-August delivery being quoted at 21.75c., New York, with September not less than 22c., New York. Demand is heavy from many sources, domestic and foreign, and stocks are being rapidly depleted. Already the Government stocks of about 140,000,000 lb. have been sold and Japan has been a very heavy buyer, authoritative estimates placing that country's purchases at not less than 32,000,000 lb. in recent weeks and this buying continues. The labor situation is also likely to be an important factor in the future of the market. It is stated that only about 40% of the normal supply is now available in the West and much of this lack of labor will not be available again until after harvesting, while at the same time emigration to foreign countries is a serious item. One or two producers are now entirely out of the market for July-August delivery and are quoting not less than 22c. for September with no quotations beyond that. Lake copper is scarce for July-August delivery but is quoted at 22 to 22.50c. for this position.

TIN

Buying of tin during the last week has not been enough to talk about and therefore the market has been and still is very quiet. It is the only one of the markets that is actually inactive. There has been more demand for retail lots than for the wholesale and this has come from those interests, mostly small consumers, who did not take the allocated metal. There was some talk a few weeks ago that it would be financially advantageous for those holding allocated metal to sell it and buy future delivery. It has been said that as

high as \$300 per ton profit would be possible. It seems, however, that very few if any large consumers seem willing to take advantage of this possibility. The allocated metal in consumers' hands, which is available, is quoted at 70c. per lb., New York, for spot delivery with very little moving. Future shipment of Straits tin from the East is quoted at 51c. with Straits tin from England held at 52.25c. A stronger and higher market is predicted by some.

LEAD

The market is strong but quiet although from one or two sources a good demand is reported. The feature of the week has been the advance on Monday, July 14, by the American Smelting & Refining Co. of its price for early delivery from 5.40 to 5.50c., New York, or 5.15 to 5.25c., St. Louis. This advance has been expected for some little time and another in the near future would not come as a surprise. Some reports are to the effect that already business has been done in the outside market at 5.65c., New York. At any rate future lead has sold at \$2 per ton over the prompt level, or at 5.60c., New York.

ZINC

The strength of the market is pronounced and prices have advanced steadily. The metal is even reported to be scarce. Almost daily in the last week quotations have advanced and buying by galvanizers and by brass makers has been heavy. Export demand has been no small item as has also the higher prices for ores. Prime Western for early or July-August delivery was today quoted at 7.70c., St. Louis, or 8.05c., New York, ushering in 8c. zinc. For September delivery 7.75 to 7.80c., St. Louis, is the asking price. Sellers are not forcing future delivery but are inclined to await developments.

A fair business is being done in high-grade zinc at about 8.50c., delivered. Sheet zinc is quoted at \$10 per 100 pounds.

ANTIMONY

The market is quiet and dormant with quotations unchanged at 8.37½ to 8.50c., New York, duty paid.

ALUMINUM

No. 1 virgin metal, 98 to 99% pure, is quoted at 32 to 33c., New York, in wholesale lots for early delivery.

ORES

Tungsten: Chinese and Japanese ore has sold at about \$7.25 per unit. A good demand for scheelite is reported; it is quoted at \$10 to \$12 per unit. There has been no test of the ferro-tungsten market and no reliable quotations are available.

Molybdenum: Quotations are nominal at 75 to 80c. per pound of MoS₃ in 90% concentrates with demand very light.

Manganese: Very little business is reported and actual values are hard to gauge. For the first time in nearly five years 714 tons of manganese ore from Russia was unloaded at Philadelphia last week.

Manganese-Iron Alloys: American producers of standard ferro-manganese have reduced their quotation to \$115, delivered, more than meeting the British price of \$115, sea-board. Very little business is reported. The spiegeleisen market is more active with sales of 1500 tons recorded and inquiries for substantial quantities. Quotations are about \$35, furnace, for 18 to 22% alloy. Definite inquiries for this alloy from German-Austrian sources have appeared and some business has been done with other foreign countries.

General Electric
General Office **Company** Schenectady, N.Y.

SPEAKING of legal 'technicalities', as we do on another page, we are reminded of a story. An Irish attorney brought suit for a woman and failed to make his case, so that the Judge awarded a nonsuit. His client thought she had won and asked, "What of it, Judge Cooney?" for so the attorney was known to his friends. He replied, "We were about to win, Madam, but owing to a technicality of the law, the Judge decided against us."

CALIFORNIA'S Commissioner of Corporations, Mr. E. C. Bellows, has found it necessary to issue a warning to the investing public against offers of stock sent through the mails from outside the State, promising extravagant returns on so-called investments. Alluring pamphlets from oil companies operating in other States are being circulated freely among our people, usually without authority to offer such securities in this State and therefore in violation of the Corporate Securities Act, known commonly as the Blue Sky Law. The failure of such peddlers of get-rich-quick stocks is presumptive evidence against their good faith, for, if they complied with the law, they would have to undergo a full investigation of their assets and liabilities, methods of operation, prospects, and the reputation of their officials and agents—in short, the people of California would receive the protection that the Legislature intended to give by means of the Blue Sky Law.

LADY prospectors are frequently featured in the press of our mining communities. We note that one of them, no less than 70 years old, a veteran in the search for happiness if not for gold, has struck it rich near Marysville, itself named after some worthy pioneer of the gentler sex. This good lady found quartz assaying \$200 per ton; and we hope there was at least a ton of it, but we are forced to doubt the favorable inference because the local chronicler says that "the pay-streak is only a few inches wide, but is free-milling ore." If it assays \$200, it does not matter whether it be free-milling or refractory as a pack-mule. If women should emphasize the passing of the suffrage law by usurping the place of the male prospector we might expect a new style in the writing of reports. They might speak of a lacework of quartz seams or an insertion of calcite; if the lady prospector will but skirt the foot-hills she may find that the strata are pleated in lovely folds and that the limestone forms a ruching around the rhyolite; in her gentle hands

the fairy tales of science and the long result of time will become so poetic that even the wild-catters will cease to speak of a precarious prospect as a 'manufacturing proposition', preferring to dub it a flirtation with the fickle goddess of Fortune, which would be more nearly true.

MATHIAS ERZBERGER, now Vice-Premier and Minister of Finance in the German government, made an important disclosure on July 25 when he quoted documents to show that Britain and France made overtures for peace in August 1917. The German government, through Dr. George Michaelis, the Chancellor, delayed its reply for a month and then gave a curt refusal to the proposal, although the Papal nuncio at Munich urged a conciliatory treatment of the attempt to terminate the great calamity. Herr Erzberger also referred to President Wilson's effort to bring about peace in 1916 and says that it was "sabotaged by the proclamation of unrestricted submarine warfare," instigated by the military party in Germany. In the light of these revelations, the drastic terms of the Treaty of Paris seem more than ever just; moreover, the disclosures of these earlier overtures on the part of the Allies should serve also to reconcile the German people to their misfortunes, which are logical.

UNDER 'Discussion' we publish a further contribution by Mr. H. R. Sleeman on the subject of 'Mill-tests v. Hand-Sampling'. Mr. Sleeman, it will be remembered, wrote a thoughtful letter, which appeared in our issue of March 29, discussing an earlier and most interesting article by Mr. Morton Webber on the same subject. In this article Mr. Webber advocated the determination of a series of sampling-factors by making a number of comparisons between hand-samples and bulk-samples, or 'mill-tests', from different parts of the mine under examination, and Mr. Sleeman, in his discussion, among other things pointed out the difficulty of obtaining sufficient hand-samples for each comparison, and the consequent danger of the average of the sampling-factors being erroneous. Mr. Webber took issue with this, contending that Mr. Sleeman had misunderstood his article, and it is in reply to Mr. Webber's letter that Mr. Sleeman now writes. He brings out the point that the bulk-samples should be taken according to the distribution of the ore-shoots, and not according to any system of equal measurements; but stands by his contention that many

comparisons would give such divergent results as to discredit them without further sampling. From our own experience we may state that discrepancies between hand and bulk samples consistently within the limits of 5% and 10%, such as Mr. Sleeman considers desirable for the safe application of the method, could occur only when the mineral distribution was of such uniformity as rarely comes within the experience of the profession.

PROMOTERS and reporters play the very devil with geology. For instance, we read in one of our local papers that the president of a mining company at Tonopah "reports everything in tip-top condition." No wonder, for "at present they are in a formation of anthracite and porphyry, which is the true formation to make ore in the Tonopah district." We hasten to the help of a bewildered reader by suggesting the substitution of 'andesite' for 'anthracite'; but even that will not suffice to make sense, because the andesite is a 'porphyry', that is, an igneous rock in which some mineral is so prominent structurally as to give it a speckled appearance. In this same Nevadan prospect we are told that "they will soon cross-out on the 200 and then some real developments are bound to be found." This is an excellent example of journalese, using the abstract instead of the concrete; we hope they will find some real ore, that is, 'pay-ore', instead of anything so indefinite as 'developments'. One can find them without incurring the cost of mining.

OUR excellent contemporary 'The Commercial and Financial Chronicle', of New York, publishes statistics of gold and silver production in its latest issue. It gives 160,879,206 ounces as the world's output of silver in 1918, as against our estimate, published on June 7, of 177,453,300 ounces. The difference is mainly in the Australian figures, as to which the 'Chronicle' is wrong. Our Mexican estimate is also considerably larger, but as to that we are less confident. The world's gold production is not given by the 'Chronicle', owing to the lack of statistics for countries other than the United States and the British dominions, but we note that Russia's output is estimated at \$17,157,594, as against our estimate of \$10,000,000, it being our opinion that the political disorder in Siberia crippled mining in 1918 more than apparently our contemporary is inclined to believe. In all such estimates of world production, the statistician is faced annually by the lack of accurate data from any but the English-speaking countries. Another trouble has been made for the statisticians by the fall in dollar-pound exchange: the 'Chronicle' uses \$4.8665 as its equivalent for the pound sterling, but that ratio has become academic.

YGNACIO BONILLAS, the Mexican ambassador to the United States, has found it convenient to explain that Mexico has a stable government and that if parts of the country are subject to bandits it is but the aftermath of civil war, just as parts of the United States

were in a condition of disorder after our own unpleasantness. He likens Villa and Zapata to Jesse James and Geronimo, and bespeaks co-operation in the pursuit of such bandits across the international line. This spoof he follows with an assertion that "foreigners in Mexico are afforded every protection," in calm defiance of evidence, continually accumulating, to the contrary. He insists that Carranza's troops are "ever on the heels of these bandits"; but the trouble is that they fail to overtake them and when they do they either shoot into the air or sell their guns to the gentlemen with heels. Perhaps Señor Bonillas will be better understood when we note the fact that he is to become a candidate for the presidency of Mexico. Meanwhile American sentiment on the treatment of our nationals in Mexico is developing, even to the point of a suggestion made in Congress, and applauded, that American troops be sent into Mexico to give the protection the government of that country is unable to provide for the lives and industry of peaceable citizens.

AMONG recent prospectuses we note that of the Romince Mines Company, organized to operate the Big Four group of claims in the Gowganda district of Ontario. We are informed that these prospects are "within a short distance (just about a mile) of the famous Miller Lake O'Brien mine," but this does not mean much to us because we know that a bonanza is often within stone's throw of a borrasca, in short, richness may about upon poverty in rocks as in life. Indeed, the fact that a number of famous mines are situated within "a radius of five miles" of the Big Four property would not unloosen our purse-strings if we were inclined to speculate in the stock of the latter. We would ask for more pertinent proof of our chances to become rich thereby. "For those who would grow independent," says the prospectus, "the time for investment is when the great producers are still in the development stage." We agree to that, although we would say that for the speculator in mines the promising prospect affords the best chance of making money; but more than conversation is needed to indicate that the prospect is one of promise. "Canadian silver mines are today making fortunes for hundreds of people." This is true, as it has been during the last fifteen years, but there are thousands of people who have lost money in such enterprises and the wise man will seek for evidence to assure him that he will be counted among the few, not numbered among the many. Such evidence the Romince prospectus fails to give. "Every geographical indication says that the Big Four mine will be no exception to the rule" of enriching its stockholders. Geographical or botanical or entomological indications are insufficiently convincing; we want to see testimony as to facts and an opinion as to results from a competent engineer, that is, one experienced in this kind of mining in this region. "Mining has scored less than 35% of failures as against 95% of failures shown in the general merchandising business of the United States." This is not true. Take the number of claims located in any important mining region and find out how many locations

even went to patent; then count the number of claims patented and find out how many of them became profitable mines. Mining is not less risky than other forms of human enterprise, but it is, we believe, more profitable if properly conducted. The proportion of mining ventures intelligently managed is relatively small, so that the number of failures is proportionately large. We hope that the promoters of Rominceo, or Big Four, will take warning from the experience written large on the records of mining. "A mine contains a crop already raised, harvested, and on deposit in the bank for you to check against at your pleasure," says this prospectus. A mine may be likened to a crop that exists amid a mass of weeds, sometimes in a swamp that must be pumped dry, usually so situated that the harvesting requires the maximum of skill in order to obtain a product that is marketable. It is a crop that once garnered cannot be renewed; there is no rotation of crops in a mine; it is a wasting asset; and the pleasure of checking against it is dependent upon scientific effort and intelligent labor such as the ordinary writer of prospectuses cannot appreciate and cannot himself contribute.

Editorial Independence

In order to correct the aberrancies of such journals of opinion as 'The Nation' and 'The New Republic', a rival called 'The Review' has been started in New York by a group of gentlemen calling themselves Constitutional Republicans. We fear that the new periodical will not be sufficiently voluminous to correct all the errors of its two principal rivals, but it has started on its career under good auspices in one respect at least. We note that the act of incorporation contains the following provision: "In the conduct of the said journal and its editorial policies, the Editors shall not be responsible or accountable to the Corporation for any opinion, comment, or criticism lawfully made or expressed by them." If this proviso is faithfully observed, the 'Review' should prosper, it being assumed that Messrs. Fabian Franklin and H. de Wolf Fuller, the editors, will prove judicious and effective writers. It is gratifying to note in these days that editorial independence from the business department is recognized as an essential feature of self-respecting, and respected, journalism. We do not include the Hearst gutter-press or other similar manifestations of newspaper prostitution. As regards the trade and technical press—or 'class' journals as they are more properly called—it is pleasant to record the fact that the independence of the editorial department is generally recognized, because, fortunately, the syndicated groups controlling most of, but not all, these periodical papers are devoted neither to political nor other propagandist purposes, but to the straightforward making of money out of the business of publicity, and therefore they leave the editorial policy to the proper persons, having discovered this to be the more excellent way. In this respect they are more fortunate than many daily newspapers. Further, the technical mining papers of this

country, namely, the one in New York and the one in San Francisco, escape the menace to their integrity presented in England—and that means London in this context—by the 'company meeting'. When a British mining or metallurgical company holds an annual or other public meeting, the record of the proceedings is sent to the press, and payment is made for publication at rates equal to those charged for ordinary advertisements. It is the usual practice to print the report of a company meeting in the reading matter, so that the public hardly realizes that it is paid stuff; the 'Mining Magazine' was the first mining paper in London to place the company meetings on its advertising pages, thereby making it evident to what category they belonged. Now, these company meetings are an important source of revenue to the financial and to the mining press, but they serve as a sop to Cerberus in some cases and as a means of unblushing bribery in others; by aid of them the financial world of London is victimized by some sixty samples of predatory journalism. It is obvious what a chance is afforded the big mining interests to patronize or to discipline the mining papers according as they are kind in their comment or severe in their criticism of the doings of the directors, promoters, and engineers connected with the various enterprises whose offices are in the City. This opportunity to exercise a sinister influence upon the editorial policy of the three mining papers in London is used even when, as in the case of the 'Mining Magazine', the company meetings are relegated to the advertising pages. If the editor offers vigorous criticism of anything done improperly by the chairman or directors of a mining company, he may expect to be told by his associate in the business department that he has been notified that the report of the next company meeting will be withheld, which means that the sop will be given to other papers, but not to his. To be frank, the publication of the report of the company meeting has only a slight news value, because it will have appeared—at the customary cost—in the daily financial press before it can be read in any weekly or monthly periodical, and it also has only a small value for publicity, by making known the mining company and thereby helping the market for its stock; it exists chiefly as a source of revenue to the press and a means of persuasion to the financiers; in short, it is baneful. In time the proprietor of a real technical periodical discovers that although the sacrifice of his opportunity to exercise his function as a critic may augment the number of company-meeting advertisements it will repel the kind of reader he desires, namely, the engineers, consultants, and managers of mines, and concurrently the business department will lose the kind of effective subscriber that it finds necessary in fulfilling the purpose of its publishing activities, which is to furnish a medium of publicity for those selling the supplies and machinery used in mining operations. Shareholders, directors, and the like are dead wood to the manufacturer, because they do not buy, nor do they even select, the things advertised in a mining paper; therefore they are ineffective subscribers or readers. The American

mining paper, while claiming no particular virtue, misses this source of revenue and likewise escapes this means of corruption; the big mining and smelting interests can exercise no such covert influence, and the character of our papers is fortified thereby. The only direct menace to the freedom of the technical press would be the purchase of a paper by one of the big mining or smelting combinations, and of this there has been no sign whatever at any time or in any place. The mining public would resent it too quickly to render it practicable. A periodical, called 'Mines and Methods', was published for a few years at Salt Lake City in order to wage a vendetta on the part of one mine operator against another, but it failed, as it deserved, because it had no legitimate reason for existing, despite the printing of an occasional technical article of some value. The metal dealers are almost the only advertisers with whom the editor comes into necessary contact, in the course of his duty to give his readers well-informed comment on current events, but they constitute a very minor part of the clientele of the 'Mining and Scientific Press', largely because the metal markets centre at New York, so that our comments on such matters also can be made without incurring the sorrowful rebuke of our business department. Indeed, an editor can feel grateful for such freedom of his pen as comes from the fact that he is called upon to write on matters that do not affect the pocket nerve of his advertising supporters. Such detachment—not degenerating, however, into vacuous aloofness—is the best guarantee of reasonable independence; absolutely independent no human being can be, for every man has prejudices and preoccupations that color his views of life; but we confess that the editorial ideal, expressed though it may be with some lack of literary refinement, is the truly American notion of living so as to be able to look any man in the face and tell him to go to hell, most politely, most politely.

War Minerals Relief

The Commission created under the War Minerals Relief Act has finished its session in San Francisco and is now at Medford, Oregon, where a large number of claims are being presented for adjudication. In our issue of July 19 we expressed a not unreasonable feeling of indignation against the ruling of the Attorney-General in regard to awards under the Act, our opinion being that this narrow interpretation was entirely out of harmony with the spirit of the enactment and if accepted in the decisions of the Commission it would do serious injustice. The fact is that under the Attorney-General's ruling the ones most likely to receive compensation are those who delayed in one way or another to produce the needed minerals until specifically requested to do so by an agent of the Government. Those most patriotically inclined responded to the earliest suggestion of the Government, as to the production of chrome, manganese, tungsten, and pyrite, for they acted on the suggestion when it was

first conveyed to the mining public by means of the press. These men did not wait for a specific request from a Federal official assuring them definitely that the price of the mineral would be fixed or some guarantee made against loss; they went to work on the first promptings of duty to the Nation and if they saw a chance of making some money honorably while discharging that duty they are still deserving of a practical form of gratitude for the service they performed at a time of acute crisis. Here we may advert to the fact that during the sittings of the Commission in San Francisco, it has happened often that a claimant for compensation has been asked whether he produced, or set to work to produce, the war minerals for a patriotic purpose only or whether the expectation of gain had motivated him; to this the witness has usually replied by acknowledging the pull of family obligations and the like; whereupon he has been asked to state the proportions of patriotism and self-interest respectively that had moved him into productive action. We submit that this is not fair, because it is given to few men to appraise accurately the multiple motives that induce them to perform certain actions, good or bad, and that the most conscientious man is the one bound to suffer most before the Commission when undergoing such a catechism. Psychologically it is a defective way of getting at the truth. If a man comes forward to serve the nation, we do not ask him whether he is moved to do so in order to win the esteem of his fellows, to do work that he likes, to salve his conscience, or to please his mother. The one fact that should weigh is his willing performance of the service. In considering the sufficiency of published articles as constituting encouragement or invitation by the Government to produce war minerals, it should be borne in mind that the Government generally was unable to resort to personal solicitation in its various food-saving and other war-time measures; instead it conducted a nation-wide propaganda by means of the press, knowing that the people depended upon their newspapers, periodicals, and class journals to keep them informed as to the things they could do in the furtherance of the national purpose. The publication of a dispatch from Washington to the effect that certain things should, or should not, be done was generally regarded by the good citizen as a personal order or request. There is also the fact that on March 17, 1918, the California Chrome Company issued an advertisement urging the production of chrome, and this was done with the full knowledge of, if not instigated by, the Ferro-Alloys Section of the War Industries Board. Furthermore the price of 80 cents per unit then established was rendered possible only on the basis of an understanding with the Government. It was under these conditions that the statements in regard to the country's need of certain minerals by Secretary Lane, Mr. Van H. Manning, Mr. George Otis Smith, and other officials at Washington were read and acted upon. To ignore these facts is wrong; it is entirely contrary to the observance of that good faith which must be implicit in any official utterance and action.

DISCUSSION

Mill-Tests v. Hand-Sampling

The Editor:

Sir—My copy of your issue of March 29 has been delayed and has only just reached me. I have read Mr. Morton Webber's stricture on my comments concerning the method of checking hand-sampling described by him in your issue of September 29, 1917.

I regret that Mr. Webber should be personal. If I misread his words, assuredly that does not infer that I deliberately distorted them. Obviously I had no possible object in wantonly misreading or distorting it. In re-reading my letter it does not seem to me to appear unmodest or offensive. Indeed my intent was only to discuss a certain part of his contribution, not to criticize.

I have re-read Mr. Webber's article and I find that I did misunderstand him as to the matter of the number of hand samples accompanying each bulk sample. I think I inferred smaller areas, and therefore smaller individual bulk samples, and a larger number of them than he meant. No doubt the big discrepancies he supposed between the different comparisons of results of mill-tests and of hand-sampling led largely to my mistake. A sampling error of 25% would be enormous and to me suggested that the sampling of the ore comprising each individual mill-test could not comprise a sufficient number of samples to bring properly into play the law of averages.

Subject to the bulk samples being sufficiently big and to the number of hand samples accompanying them being sufficiently large, I quite see the value of Mr. Webber's method and appreciate his publishing details concerning it. I must confess, however, that were I to obtain a difference of up to 25% between results from bulk and hand sampling of a particular place, I should not be satisfied, without further sampling and investigation, to accept such a difference for the purpose of applying the idea of a sampling-error over a considerable area or tonnage. Reading Mr. Webber's later comments, I think that, apart from the above, the one point on which we may differ is with regard to the selection of the localities for the bulk samples.

I infer from Mr. Webber's letter that his method of subdividing the deposit into areas, each one of which has its mill-test, is mainly into rectangular areas of more or less equal dimensions, but arranging and modifying these as rendered desirable by the varying nature of the ore. His diagrams give me that impression. Whether my inference is correct or otherwise the point seems worth elaboration.

It appears to me that primarily the location of the bulk samples should depend on the distribution of the various types of ore. The most usual variation with which we have to deal in any one deposit is that of change from ore in varying stages of secondary alteration to unaltered primary ore, and this variation would occur mainly vertically, though by no means wholly so. I submit that a logical basis of applying the idea of sampling-errors based on bulk tests would be to first map as closely as possible the outlines of areas consisting of the different classes of ore into which it appears best to classify the deposit, the locality of each bulk sample being then selected with regard to such outlines. With regard to the numbers of bulk samples to be taken for each class of ore, that I submit might largely depend upon the sampling-error indicated as the results of bulk-tests and of hand-sampling were obtained and compared. If such results indicated approximately similar differences between bulk and hand sampling, then a very few bulk samples should suffice. If, on the other hand, the results gave widely varying differences between bulk and hand sampling, then more comparisons (that is, more bulk samples) would be needed.

Thus, supposing for one class of ore, two or three such comparisons gave a similar difference (say, varying from 8 to 10%), it is fair to assume that those comparisons could safely be used for the purpose of establishing sampling-errors, or alternatively one average sampling-error, for the whole of that class of ore, whether in one area or not. On the other hand, if the results of the first three comparisons varied, say, from 5 to 15%, it would appear unsafe to stop at that number of comparisons. Sampling-errors based on such comparisons, whether applied separately or on the basis of average to all that class of ore, would, it seems to me, be unsatisfying. In such cases I submit that more comparisons (more bulk samples) would be required, either to indicate the reasons for such variation—which reasons might greatly help in finding what allowances to make—or to bring the law of averages sufficiently into operation. Speaking generally, it seems to me that sample-errors would better be obtained and applied as to different classes of ore rather than as to different areas.

It might be that different types of ore (that is, types of ore that might give different sampling-errors) occur so distributed that the dividing of the different types by means of areas would not be feasible. In such cases the logical method seems to be to hand-sample the different types separately and to secure sampling-errors (by means of bulk samples) for each type. The tonnage of

each type would then have to be estimated as closely as conditions permitted and the corresponding sampling-errors applied to the different tonnages. It is impossible within modest length to do more than outline ideas and the above must of course be read as not attempting to particularize.

With regard to Mr. Webber's further comments; these in no wise controvert what my letter stated. One cannot provide against every possible misreading of one's words without running to unwarranted length. My letter was meant to indicate (and seems to me clearly to do so) that latent errors in sampling exist, apart from 'sloughing' or 'horses'. But for this admission, the checking of hand-sampling by bulk tests would obviously be superfluous. I say, "it seems to me that mill-tests may be a most useful check on results obtained in (1) and (2), more particularly in some deposits (obviously those whose nature renders them more open to errors in sampling)"; again, "I believe that bulk-sampling can be used in most, if not all, cases with advantage as a check on the small samples and probably its use may enable factors of error to be obtained that can be applied to the whole of the small samples." I would add here that where bulk tests cannot be made, the engineer must just rely on his experience and observations to judge what allowances he should make for the sampling-error in each case.

My reference to the comparison of sampling results with the results of actual operations, either in the same mine or in neighboring mines, includes allowance for sampling-errors. Truly such comparisons include also decrease in grade due to 'sloughing', 'horses', etc., and these sources of error cannot by such comparisons be proportioned. They give only comparisons between sampling results as a whole and actual working results as a whole, both as regards grade and tonnage, but do not indicate how much of the difference in grade is due to sampling-error and how much to inclusion of country-rock. If one had the means of estimating the proportion of country that has got into the ore treated, he might from that deduce the approximate sample-error.

In closing, I would mention that I asked a question in my letter. It was whether, in the event of a bulk sample giving higher results than its accompanying hand-sampling, would Mr. Webber apply the factor so obtained by increasing proportionately the results of hand-sampling within the area concerned. In everyone of his comparisons the hand-sampling gives higher results. There would sometimes, if infrequently, be cases of it giving lower results.

Perth, Western Australia, June 4.

Patent Controversies

The Editor:

Sir—The writer read with interest in your issue of June 21 your discussion of the Supreme Court's decision in the Minerals Separation controversy. In your editorial discussion of the decision you state, "The entire controversy proves once again how undesirable it is to

leave the decision of technical and scientific questions to courts composed of men without a special training for the understanding of such questions." Your conclusion is so sound and basic—striking at the root of many of our legislative and judicious tangles—that I could not resist the impulse to write to you and tell you so. In our legislative panaceas we assume the probity of purpose actuating the average individual as to his desire to reach a morally correct conclusion on any given question, but in providing the legal machinery for carrying these panaceas into effect we apparently assume that mere probity of purpose is a sufficient qualification for a jurist or a legislator to solve any given question under the sun. We are possibly approaching an era when tribunals, legislative and judicial, will be organized along trade or technical lines and to which will be referred the questions particularly falling within the scope of the educational qualifications and experience of each with mixed or general tribunals confining their activities to questions or principles of human relationship in which the issues do not involve points that require technical understanding. The two forms of issues mentioned, while frequently having a distinct line of cleavage, will as frequently interlock, but in such cases we can trust that technically equipped minds do not necessarily lose their probity or balance of judgment by reason of being so equipped. A short book by Steinmetz analyzes this problem in an engaging and convincing manner.

Juneau, Alaska, July 2.

The Status of Gold

The Editor:

Sir—In your issue of March 22 there appeared a letter from me presenting an argument that the value of gold is greater today than at the time when the weight of the British sovereign was fixed, and in your issue of May 17 I replied to certain criticisms on the first letter.

In these letters I plainly pointed out that governments cannot fix the value of gold, they can only recognize the values placed upon the metal by humanity; the value placed upon gold by humanity has increased since 1812 and the fact must be recognized; the "maintenance" of the present price of gold and the failure to "adjust" that price to the true present value will incite hoarding, will increase labor troubles, and will increase the gravity of the present financial situation of the world.

Nowhere in what I have written is there a basis for the criticism that "Mr. Robbins appears to be obsessed by the idea that a government by legislative action can infuse more labor-energy value into labor-energy value already existing in the form of gold." My contention is that governments must by legislation recognize the true labor-energy value that already exists in the form of gold; the infusion of labor energy-value into gold has already taken place, and the fact must be recognized. No critic has shown that the labor equivalent of gold has not increased during the past one hundred years, nor that governments cannot recognize a new value in gold.

In spite of the statements made to the contrary, I maintain that to increase the price of gold will not only lead to an increased output of that metal from mines, but will bring into circulation a vast amount of hoarded gold. In the reduced hours of work, increased wages, and higher standards of living, in Australia, South Africa, Canada, and the United States, I find what seems to be irrefutable evidence in support of my contention. The stupendous development of Western United States, Australia, and South Africa received its impetus from the discovery and production of gold; and all of this development has taken place since the price of gold was fixed. Every ounce of gold has stored in it some labor-energy value not only of the miner, but of the prospector, the railway-builder, the ship-builder, the road-builder—in fact, of every man, woman, or child who has contributed mental or physical labor toward building up civilization, for gold is the exchange commodity for settling balances in the world's exchange of labor.

Attention has been drawn to the fact that the present high cost of living synchronizes with the recent increased production of gold, but it also synchronizes with the wonderful growth of scientific achievements; measured by benefits demanded, it is probable that the cost of living would have increased regardless of increased gold production, for the production of large quantities of gold has facilitated, it did not cause, expansion.

Life today embraces the use of automobiles, electric lights, and thermos-bottles; these things are rights of heritage, and the benefits that now accrue to the few are rapidly entering into the life of all. The advance of civilization may be checked only by stopping education and by making it a capital crime for any brain to have an original thought, for any man to originate an improved method, for any inventor to discover a way of making life more enjoyable. Facilities of communication, methods of transportation, manufacturing organization, and selling propaganda have placed humanity in possession of countless refinements—refinements that have ceased to be luxuries, having become necessary to satisfy the knowledge of life's possibilities, and not only have people learned of the things they may have, but they have found means for getting those things. The business of the world has expanded enormously and the wage of today brings to its earner a greater number of benefits than did the wage of years past.

Now, all of this increase in wealth, in business, is based upon promises to pay. Stocks, bonds, insurance policies, mortgages, and notes are the securities of wealth and back of all such instruments is the reserve stock of gold. But this reserve stock of gold has not increased in bulk at the same rate which has marked the increase of government, corporation, and commercial securities, and hence the potential influence of an ounce of gold has of necessity increased. The activities of humanity have infused into the reserve stocks of gold a greater labor-energy value than those stocks possessed one hundred years ago.

Our financial securities are pyramided upon a base of

gold, and always the further we get from the gold reserve the more speculative become the securities dealt in. Remove all gold from commercial use and a panic will ensue; the highest class of securities will be dealt in, and these will be hoarded, thereby adding to the difficulties of the situation. Give gold a price of \$10 per ounce and there will be a scramble to secure it for hoarding, paper securities being 'thrown overboard' and sacrificed for gold.

In the panic of 1907 instant relief was produced by the action of Morgan and Rockefeller in releasing from their private vaults forty million dollars of gold for the use of Wall Street. The present price of gold being \$20 per ounce and the present value of gold being \$30 per ounce means that gold is bound to be hoarded. Any expansion of business that tends to lessen the value of \$30 per ounce is met by a withdrawal of gold from circulation, which action decreases business and reacts to hold the labor equivalent of gold at \$30 per ounce by producing hard times.

The policy of the Bank of England has been to manipulate gold reserves so as to force the world to discount exchanges in London. I was in England in the spring of 1914, and however proud Britain may have been of her cloak of foreign trade, it ill concealed the poverty in her industrial centres.

At the present time the United States holds over two-thirds of the world's available gold supply and if our foreign debtors were called upon to settle balances in gold we should have all the gold in the world. The endeavor of European powers will be to get our gold away from us. Probably the easiest way will be for them to send their workers over here to get the gold; to work in this country at high wages, and send their savings to the home country. Every endeavor will be made to do this and we shall benefit by increasing the activities within our boundaries. But if we allow these savings to be exported at the rate of \$30 value for each \$20 of savings we shall become the centre of a maelstrom of obnoxious endeavor. The effort will not be to maintain sane conditions, but to foster conditions of unrest, to force wages to the highest point, to create as great a balance as possible against us, and may even lead to a rapacious attempt at killing the goose that lays the golden eggs.

In considering this question we must remember that impoverished Europe will allow no consideration of morals or rights to stand in the way of her financial rehabilitation. Europe is after our gold; she is going to get much of it, because we must trade and exchange and we must allow immigration; we cannot lock our doors to all outsiders and retain our wealth within our walls. Such action will reduce us to a parity with China; we should develop a condition that would guarantee a mass attack from European and Asiatic powers.

If an ounce of gold were to be priced at \$30 instead of \$20, then this marking up of the price would add a ledger increment of from four to five billion dollars to our wealth. It would do us no good to have this increased figure upon our books, for we are surfeited with

gold, both in figures and in bulk. This leads to the debatable suggestion that we give this four billions to our impoverished Allies. Great Britain need not be considered, for she produces from 60 to 70% of the annual increment to the world's supply of gold and she will profit greatly by marking up the price of gold. If such a step could be taken we should place our friends in a position to begin business immediately. Credits could be established, industry in Europe revived, the threatening wave of immigration to this country stayed, the striving of Bolsheviks counteracted, and our present invitation for a European propaganda of labor disturbance in this country withdrawn.

Speaking of European conditions, Mr. Frank Vanderlip is reported to have been most outspoken in regard to the distressful condition of Europe. In the course of a recent speech he said: "Now a lot of you may say . . . that the War is over and this tangle is going to work out in the long run; . . . You know that a man with a hungry stomach cannot wait for the economics in the long run; he starves to death. Before he will do that he will go into revolution. This thing would work out in the long run if it were one country, but it is all the European continent, . . . and it won't work out in the long run unless we help it work out. . . . Now Europe has got to save itself. It cannot be done by charity, but we have got to get a little priming in the pump to get the thing started."

I do not for a moment quote Mr. Vanderlip as supporting a change in the status of gold, his instincts as a banker would cry out against such a change, but I do make bold to suggest that a change in the status of gold would bring that commodity back into more general circulation, and would enable some billions of dollars of debt to be wiped out without direct taxation, and that such action might be the priming required by the pump to start it working once more.

There are bonds redeemable in gold, but there is insufficient gold in the world to redeem 5% of such bonds. As these bonds fall due, the demand for gold will increase and such a demand will bring about restricted credits and diminution of trade. If business increases during the next 25 years at a rate commensurate with the increase experienced in the 25 years before the War, then it is probable that the value of an ounce of gold will be nearly double the price. This is an increment of power that we will do well to avoid. We must guard against forces tending to disrupt society, and we should be farsighted enough to uproot a cause tending to generate such forces.

Mr. Vanderlip reports currency conditions in Europe as being chaotic. British paper currency increased to one and a half billion dollars with less than 10% of that amount secured by gold; Austrian kronen notes with less than 3% of gold reserve; French franc notes circulation increased from 6 to 36 billions with a simultaneous decrease in gold reserves; Russian paper money of unknown amount is being circulated without gold reserves. Any plan that will give value to European currency, that

will help stabilize it, will help to avert the crisis that not a few thinking observers fear.

Conditions have arisen in the world rendering the old standards of society untenable; humanity is in no condition to abide by those restrictions which are implied by and are necessary to the survival of archaic standards; and any change of standard that will in the slightest degree ameliorate existing conditions is worthy of serious consideration.

Two little pamphlets of very modern political economy adjustments of pertinent interest to myself lie upon my desk. They are 'The War Tax' as passed by the United States Congress in February 1919, and 'An Act to Amend the Income-Tax Act,' recently assented to by the Canadian Parliament. A third pamphlet, of less immediate personal interest, but of interest nevertheless, is entitled 'The Inheritance Tax'. From these three little volumes I deduce that some adjustments are necessary in our political economy. From their pages I gather the message, "To him that hath not shall be given, and from him that hath shall be taken away much that he hath." And I find in this an indirect recognition of the true status of gold.

San Francisco, July 17.

Protection to the Quicksilver Industry

The Editor:

Sir—Your highly appreciated reference to my letter of June 7, discussing the quicksilver industry, in your issue of the 21st ultimo, encourages me to re-open this subject in your paper, the more so as since then two statements have been published endorsing the policy of leaving the quicksilver industry unprotected. One was made by Mr. W. R. Ingalls, as published and commented upon in your issue of June 28, the other is a letter from Mr. F. F. Sharpless appearing in the 'Engineering & Mining Journal' of July 5, wherein he advances the view that protection of that industry might be a serious burden on the consumers; and that, as the London house of the Rothschilds has not disturbed the quicksilver industry in the United States, such is not liable to occur in the future.

During the latter part of the War it has been suggested that the resources of the various countries should be practically considered as one common asset, in fact, a theory of economic internationalism, in direct contradiction of the pre-war conviction that every country had to develop its resources to the best of its opportunities. The main argument against the protection of the quicksilver industry is based on this theory of economic internationalism. This theory, however, is not yet so generally accepted as to become a safe guide for the regulation of the development of the resources of the different countries, and even in this country, when large interests are at stake, it is flouted. This is emphatically indicated by the offered explanation why the imports of dyes, dye-stuffs, and potash are restricted, in order to protect the dye and potash industries. Why, if the farmer has

to pay higher for his fertilizer in order to protect the infant potash industry, should the quicksilver consumer not help to keep the domestic production of that metal alive? The only reason is that the quicksilver producers are nothing like so influential as the interests behind the dye and potash industries. It does not appear to me that the sentiment of nationalism has lost enough of its influence to allow, as yet, the endorsement of this economic conception by the various nations of the world that are active producers.

The quicksilver producers do not demand an unreasonable degree of protection; most of them would be perfectly satisfied with an assured market price about as it was last year. The danger of the situation lies in the fact that, while in pre-war times the Rothschilds only controlled 34% of the total world's production, they at present control 77.5%; and that, therefore, the conditions are entirely different. In pre-war times the import values were often below the figure at which the Rothschilds can sell on the London market. That being the case, what is there to prevent them now from wiping out their only competitor, and then raise the price to whatever they deem proper, unless the domestic producers are adequately protected?

The decision of the U. S. Attorney-General in the case of the mine operators of the so-called war minerals, claiming indemnity for losses incurred in opening up those mines at the solicitation of the Government, to which you refer in your issue of July 19, is another argument to bring home to the quicksilver producers the absolute necessity for gaining influential backing, and is, I hope, a lesson for them to get together, and to interest the other mineral producers in their case, which thus far they have failed to do.

WILLIAM FORSTNER.

San Francisco, July 19.

The Elm Orlu Case

The Editor:

Sir—In your issue of May 10, 1919, the Elm Orlu case is reviewed by Mr. Searls.

It seems that the Elm Orlu is the senior location, the Black Rock the junior location, and the Black Rock was the first to be patented. Mr. Searls makes this statement: "The Black Rock owners by their prior patent thus gained title to all of the surface of the Elm Orlu", covered by the Black Rock conflict. It seems that the owners of the Elm Orlu claim had full and complete possession of their claim, free from any entanglements, up to the time the Black Rock was located.

Section 2322 U. S. Mining Laws reads: "The locators of all mining locations . . . shall have the exclusive right of possession and enjoyment of all the surface included within the lines of their location, etc." In giving the Black Rock claim the shape of a parallelogram as near as may be, it became necessary, it seems, to lap onto and conflict with the Elm Orlu claim and seemingly without any intention of claiming the conflicted area.

The owners of the Black Rock claim being first to

patent are given every foot of ground within their claim-lines, including the conflicted area with the Elm Orlu claim. This puts a burden upon the senior-claim owners wherein they are compelled to go into court and defend rights guaranteed under Section 2322 or forfeit their rights in the land covered by the Black Rock conflict. This is so unjust that it is strange that it should go unchallenged. Why put the burden upon the senior locator? When the junior locator is first to apply for patent, why not demand of him that his hands shall be clean, that he shall state in his application for patent that the conflicts his claims make with senior locations (giving their names) be excluded from the patent. Should he fail to do his plain duty in this respect and the conflicts show up in the Mineral Deputy's report, all patent proceedings should stop until such time as the applicant for a patent shall ask that the conflicted areas be excepted from the patent or else show a deed to said conflicted areas. To do otherwise, to put a burden upon the senior locator, is putting a premium on the bad faith of the junior locator when he is the first to go to patent with claim evidently in conflict with senior locations.

Our Jarbidge mining district is cursed under the same rulings. Junior locators when first to patent are given all the land within their claim-lines, including areas conflicting with senior claims. No doubt this is true in other districts. Under such a ruling it is exceedingly hazardous to permit a junior locator to lap onto or across the claim of a senior location unless the certificate of location states that the conflict with the senior is excepted. Can this unjust ruling be eliminated and the rights of the senior locator respected as guaranteed in Section 2322? I hope so.

A. L. RINEARSON.

Jarbidge, Nevada, July 15.

Methods at the Afterthought Mine

The Editor:

Sir—I have read with much interest the articles by Mr. Lang entitled 'A Metallurgical Journey to Shasta, California'. In your issue of July 12, 1919, I was particularly interested in his description of the methods employed at the Afterthought mine, as I was engaged at the property from 1905 to 1908 as assistant chemist and assayer and during the latter part of 1907 as head chemist. The company was then known as the Great Western Gold Co., the metallurgist and manager being S. E. Bretherton. I am surprised that his name was entirely omitted from the article, as it was he and not Mr. Herbert Haas who made a success of the plant.

Mr. Haas designed and built the original smelting plant at Ingot, tried it several times unsuccessfully, and finally gave it up in the summer of 1905, when Mr. Bretherton took charge of the plant as metallurgist and manager. Mr. Bretherton ran the smelter successfully from the fall of 1905 until January 1908, when the spectacular drop in copper occurred.

Mr. Bretherton added the large blast-furnace, which had a far greater capacity than the one installed by Mr.

Haas, and also installed the Bretherton hot-blast stove, which proved to be far more economical than the U hot-blast stove installed by Mr. Haas. Mr. Bretherton also added the hand-picking belt in order to have the high-grade zinc ore, and it was he who had the various tests made relative to the magnetic separation and flotation in his endeavor to save the zinc, which at that time was being wasted both in the matte and slag and in the gases going out of the stack.*

My opinion is that Mr. Lang has substituted the name of Mr. Haas for Mr. Bretherton, and I think it is no more than fair that I call your attention to what seems to me an error that I trust you will correct.

San Francisco, July 12.

FRANK L. WILSON.

The Editor:

Sir—In your issue of July 12 I have read the interesting article headed 'A Metallurgical Journey to Shasta, California'. It is self-evident that the author of this article was misinformed in regard to the development of the Afterthought mining property, with which I am familiar.

On page 52 he says, "Herbert Hass, formerly metallurgist to the company, and introducer of the pyritic method there;" and again on the same page, "Other tests followed, and various processes for extracting the zinc were suggested, but nothing came of it beyond the co-ordination of ideas, and the mine laid practically idle until taken over by the present company, styled the Afterthought Copper Mining Co.†"

I wish to correct these statements, especially in regard to the property being practically idle, by stating that during only nine months actual operation of the blast-furnace, when the wagon-roads could be used, we smelted Afterthought ore and sold matte containing values in round numbers for copper, silver, and a little gold (the zinc, which was of more value than the copper, silver, and gold combined, was lost) of \$961,000 gross, net value \$852,000, after deducting freight and smelting charges. The property was developed from a good prospect into a large mine with an up-to-date smelting plant under my management without any financial assistance from the East—in fact, we had to send money East prior to 1908.

S. E. BREThERTON.

San Francisco, July 15.

COMPARING last year with the year 1913, the coal output of Great Britain has declined 20.5%, whereas there has been a decrease of only 10.5% in the number of persons employed. As a result, the output per head has fallen from 262 tons in 1913 to 232 tons in 1918. Coupled with the great increases in the wages of coal miners during the past few years, this has had the effect of seriously increasing the price of coal.

*See M. & S. P., of March 14, 1914, 'Leaching of Zinc Ore at the Afterthought Mine', by Frank L. Wilson.

†The present company is now being financed and engineered by the estate of the late John T. Milliken, of St. Louis.

Platinum at Grand Canyon

Referring to the controversy over the existence of platinum deposits in the Grand Canyon of the Colorado, as discussed in our issues of June 15 and September 7 last year, we publish herewith the report of Mr. J. M. Boutwell, whose name has been mentioned in this connection. We are informed by him that he mailed a copy of the report to us on March 18. We did not receive it. Owing to his absence abroad, he was not aware of our failure to publish it until May 27, whereupon he took steps to have another copy sent to us. We received it this week and give it verbatim below.

New York City.

United States Platinum Company, March 8, 1919.

1006 Land Title Building,

Philadelphia, Pa.

Gentlemen:

In accordance with agreement to examine the Indian Gardens property at Grand Canyon, Arizona, to determine its economic possibilities, this ground has been studied geologically, possible ore-bearing formations have been systematically sampled, 275 samples have been assayed in duplicate or triplicate, special chemical work has been done, and duplicate concentration tests have been made.

The assay report on the last of these samples has reached me today, and I now submit herewith my first report.

In all this work the utmost practicable endeavor has been made according to the best known practice to secure correct results as a basis for ascertaining the truth.

These results show that platinum ore has not been found in the ground examined in form and grade of commercial value.

JOHN M. BOUTWELL.

THE NENANA COALFIELD, which lies about 200 miles north of Cook inlet, Alaska, and will be reached by the new Government railroad from Seward, 364 miles distant, has been examined by G. C. Martin, of the U. S. Geological Survey, whose report on it has just been published. The field is about 100 miles south of Fairbanks, the inland terminus of the railroad, and is more accessible to the gold mines of the Tanana valley than any other coalfield in Alaska. The coal is a lignite of good grade which, when the field is made accessible, will be used as locomotive fuel on the railroad, for generating power and for thawing at the gold mines, as domestic fuel in the region, and as fuel on steamboats that ply on Tanana river and possibly on some of the boats on the Yukon. The report gives the classification of the coal land and non-coal land in the field by sections, contains detailed maps showing the areas of coal-bearing and non-coal-bearing rocks, and gives detailed statements of the conditions of mining and transportation. A copy of the report, which is published as Bulletin 664 of the U. S. Geological Survey, can be obtained free of charge from the Director of the Survey at Washington, D. C.

Electrolytic Deposition of Copper in the Leaching of Roasted Ore and Concentrate

By PERCY R. MIDDLETON

In a previous article* I gave a general description of some experimental work on the recovery of copper from flotation concentrate by roasting and leaching. As some doubt seems to exist concerning the possibility of using electrolytic deposition for the recovery of copper from the solutions resulting from the leaching of a roasted ore or concentrate, I have compiled the results of my experimental work on this subject, and offer this in support of my statement that electrolysis can be successfully employed in the leaching of either a roasted ore or a concentrate. This article is based on work conducted for several Australian mining companies, including the Mount Morgan Gold Mining Co. The investigations extended over a period of twelve months and were conducted on the solutions resulting from the laboratory leaching of 50-lb. charges of roasted ore and larger-scale tests wherein one ton of calcine was leached per day. In each case the operation was cyclic and extended over a period long enough to investigate thoroughly the effect of the concentrate impurities in the electrolyte.

Before starting the above investigations, I collected all the data available on the subject, and learned that the principal difficulty to be encountered was the presence of ferric iron in the electrolyte. As the solution resulting from leaching of the calcines from my earlier experiments contained large quantities of iron, I started a series of tests to determine the possibility of producing a calcine low in soluble iron, with a satisfactory copper extraction. The first experiments along these lines were conducted in a small hand-rabbed reverberatory furnace, on charges of 50 lb. of ore, and it was found possible to produce a calcine containing under 1% acid soluble iron and 95% of the copper soluble in 5% sulphuric acid, the assay of the ore, before roasting, being 14% copper and 26% iron. These results were confirmed in an Edwards furnace, roasting from 25 to 50 tons of ore per day, and I have found no difficulty in duplicating the results. In large-scale work, the terminal

temperature of the roasting operation can be held within 30°C. of any desired figure. This establishes the fact that roasting can be performed on a large scale, at temperatures high enough to decompose the soluble salts of iron, without affecting the copper extraction.

Laboratory experiments were conducted in three cells, arranged in series. Each cell had a cathode area of four square feet; it contained eight copper cathodes and nine lead anodes. The electrolyte was circulated continuously through the cells until reduced to the desired cop-

FIG. 1. EFFECT OF FERRIC IRON ON CEMENT EFFICIENCY

per content. The reduction of ferric iron was effected in a small absorption tower, made from earthenware pipes, packed with coke. Sulphur di-oxide was generated in a sulphur-burner and entered the base of the tower. Large-scale tests were conducted in a series of five cells, each being 24 by 18 by 28 in. deep. Each cell contained five copper cathodes and six lead anodes, the size of these electrodes being 14 by 24 in. After passing through the cells, the electrolyte was returned to a storage-tank, by means of an air-lift. Sulphur di-oxide was introduced into the storage-tanks for the reduction of ferric iron. Power was supplied by a small motor-generator, at the desired voltage.

Preliminary experiments proved that some means for

*'Recovery of Copper from Flotation by Leaching'. M. & S. P., June 7, 1919.

the reduction of the ferric iron in the electrolyte would have to be adopted before a cyclic process could be used. The effect of ferric iron on current efficiency is shown graphically in Fig. 1. It was found that half the ferric iron was reduced to the ferrous state during leaching, when there were four grammes of ferric iron per litre in the solution. The reduction thus effected during leaching was not sufficient to keep the ferric iron within the desired limits and sulphur di-oxide had to be used before satisfactory results were obtained.

Taking the acid-soluble iron in the calcine at 1%, the theoretical accumulation of iron in the electrolyte, with a pulp-ratio of 2 litres of solution to 1000 grammes of

FIG. 2. EFFECT OF TEMPERATURE ON CELL VOLTAGE

calcine, will be 5 gm. of iron per litre at each cycle. If it is desired to keep the total iron content of the electrolyte constant at 30 gm. iron per litre, it will be necessary to discard one-sixth the volume of the solution at each cycle. In actual practice it was found that the increase in iron was below this calculated amount; apparently the iron salts in the calcine are more readily soluble in barren sulphuric acid than in the electrolyte. The average amount of solution discarded was equal to one-tenth the volume of the electrolyte, when the calcine contained 1% acid-soluble iron.

If the copper content of the electrolyte is reduced to 15 gm. per litre, at each cycle, and the discard is made after electrolysis, the amount of copper to be precipitated on scrap-iron will be 6 lb. of copper per ton of calcine treated, when the pulp-ratio is 2:1 and the soluble iron content of the calcine is 1%. This amount will be constant, irrespective of the original copper value of the calcine. It would be commercially possible to electrolyze this discarded solution down to 7.5 gm. copper per litre, with the result that only three pounds of copper per ton of calcine treated would have to be precipitated on scrap-iron.

In both the laboratory experiments and the larger-scale tests, the regeneration of acid averaged 2.1 units of sulphuric acid per unit of copper deposited. This amount of acid was more than sufficient for the requirements of the process, even after discarding the necessary amount of solution at each cycle; in fact, an increase of acid was noticed at the end of the experiments.

In all experiments, provision was made for heating the electrolyte. The effect of temperature on cell-voltage is shown in Fig. 2.

The most satisfactory current-density was found to be between 8 and 9 amperes per square foot. Higher current-densities resulted in a lower current-efficiency, irregular cathode deposits and short circuits caused by the copper 'growing' across to the anode.

At the conclusion of the investigations, an examination of the lead anodes was made. Some scale had formed, but corrosion was not excessive in either the laboratory or larger cells.

Laboratory experiments were conducted on an ore containing a certain amount of zinc. Zinc sulphate accumulated in the electrolyte, together with iron sulphates, and it was found that the zinc sulphate had a restraining action on the corrosion of the cathode copper by ferric sulphate. With 40 gm. zinc per litre in the electrolyte it was possible to carry 20% more ferric iron without a corresponding loss in current efficiency. Fig. 3 shows the effect of zinc sulphate on current efficiency.

Ferric iron in the electrolyte is the principal cause of low current-efficiency. Other factors come into play, but

FIG. 3. EFFECT OF ZINC SULPHATE ON CURRENT EFFICIENCY

usually these are readily overcome. Ferrous iron, within reasonable limits, does not seem to affect electrolysis when lead anodes are used, but the lower the ferric iron, the better will be the results. Large-scale work showed a current-efficiency between 85% and 90%; laboratory tests were slightly higher.

The average power consumption was one kilowatt-hour for every 1.2 lb. of copper deposited.

The percentage of copper in the cathodes was not as high as in standard electrolytic copper, but the impurities would be practically eliminated in the melting.

In conclusion, I would like to state that I do not claim anything original in the above procedure. My investigations were conducted with the object of determining whether electrolytic deposition of copper could be successfully applied in the recovery of copper from sulphide ores by roasting and leaching. It was necessary to either evolve a new method of electrolysis or reduce the acid-soluble iron in the calcine; the latter was found to be the most practical and was thoroughly demonstrated on a large scale under actual working conditions.

THE MILLS OF THE AFTERTHOUGHT

The Horwood Process as Applied to the Copper-Zinc Ore of the Afterthought Mine

By A. H. HELLER

The ore at the Afterthought mine in Shasta county, California, has baffled treatment for years. The processes tried in the early history of the mine included hot-blast smelting and ammonia-carbon di-oxide leaching. In 1916 J. T. Milliken of St. Louis undertook to operate the property, and experimental work was at once started. Tests with gravity concentration were first made, but owing to the sulphides being in too fine a state and the large amount of barite in the ore, separation by gravity was impracticable. Next, tests with selective flotation, by aid of reagents, were made, both at Denver and Salt Lake City. These also were without success, although later developments of this process have shown that there is a possibility of its being applicable to ores such as those of the Afterthought.

After sundry failures with several different methods the Horwood process was tried. This had proved a part success in Australia on lead-zinc ores, but it was known that very little information could be obtained from work done in Australia, and that the application of the process to the Afterthought ore would be attended by more difficulties than those presented by lead-zinc ores. With complex ores of lead and zinc, the sulphate film formed on the lead sulphide in roasting is insoluble in sulphuric acid, whereas the oxide film formed on copper sulphide of a copper-zinc ore is more or less soluble in this acid, so that it cannot very well be employed in subsequent flotation. It is known that acid helps the flotation of zinc sulphide. Another difficulty to be expected with copper-zinc ores, and not with those of lead-zinc, is that sulphates of copper form during roasting

and cause trouble in the handling of the pulped calcine. At the same time the presence of a certain amount of copper sulphate in the pulp is also advantageous, the reason for which will be explained later.

Another treatment applicable to this ore was the electrolytic process. The only reason why this process was not tried at this time was because it was a method still in the experimental stage, the development of which would have entailed an expense unwarranted by the known reserves of the mine. The operators had foresight enough to see the possibilities of the electrolytic process, so that all equipment and buildings furnished for the Horwood process could be used to advantage in the electrolytic process in case they should decide to adopt it at a later date.

Tests with the Horwood process were so promising that it was decided to build a 300-ton plant, the construction of which was started in April 1917. Enough of the plant had been completed in September to test the practicability of the process. In December the plant was shut-down to provide storage for the concentrate, to improve the flotation machines, to finish the dryer, and to alter the roaster. Being pioneers in the process as applied to copper-zinc ores, the management could obtain no outside experienced help, so that numerous unforeseen problems had to be solved by trial. Owing to the increase in freight-rates and the necessity for some important changes in the flow-sheet, and the general operation of the plant, the mill was shut-down in June 1918. Work was immediately begun on the construction of an Edwards cooler for the roasted product, a rever-

beratory furnace for the copper concentrate, and, in order to simplify the flow-sheet, a new preferential flotation unit was built, and a different style of flotation machine introduced. It was not expected that better results would be obtained with this machine, but that the cost of operation would be much less than with the Janney machines.

A start was again made in December 1918, and all improvements came up to expectations, with the exception of the new flotation unit, which fell down entirely. To switch back to the old method of flotation would have entailed considerable expense, since practically everything in connection with the old system had been dismantled. With the drop in the price of the base metals, and recent developments and improvements in the electrolytic process, it was decided to adopt this method. Before the last shut-down results with the Horwood process were almost entirely dependent on the roast obtained, but during the interval improvements were made in roasting so that there was absolute control of conditions. A mistake, however, was made in the method of flotation, and by going back to the old conditions of flotation it is known exactly what results might be expected with the Horwood process, as applied to this or similar ores.

THE ORE. The ore of the Afterthought mine as delivered to the mill has the following composition:

| | | | |
|--------|----------|--------------------------------|--------|
| Silver | 5.50 oz. | Lead | 0.80% |
| Gold | 0.03 oz. | Sulphur | 18.80% |
| Copper | 3.10% | CaO | 8.70% |
| Zinc | 16.80% | Al ₂ O ₃ | 1.00% |
| Iron | 9.30% | Insol. (barite and silica) | 24.30% |

The following is the approximate mineralogical composition:

| | | | |
|------------------|----|-----------|-----|
| Chalcopyrite | 10 | Sulphides | 45% |
| Pyrite | 9 | | |
| Blende | 25 | | |
| Galena | 1 | | |
| Calcite | 15 | Gangue | 55% |
| Barite | 12 | | |
| Quartz and slate | 28 | | |

The specific gravity of the ore is high, being about 3.5. The collective concentrate has a specific gravity of 3.93.

METHOD OF TREATMENT. The ore is crushed to 2-inch ring and ground to pass 48-mesh; it is then subjected to flotation, producing a collective concentrate and a final tailing. The collective concentrate is thickened, filtered, dried, and roasted lightly. After cooling it is subjected to flotation again, this time producing a froth called the zinc concentrate and a tailing called the copper-iron concentrate. These concentrates are then filtered and dried.

The milling equipment is as follows:

- Coarse and fine ore-bins
- One 15 by 30 in. Blake crusher
- One 9 by 18 in. Blake crusher
- Elevator and two conveyers
- Oscillating feeders
- Two No. 64½ Marcy ball-mills
- Two Dorr duplex classifiers
- Two 3-in. Krogh sand-pumps
- Two 4-in. Krogh sand-pumps
- One 30-ft. Dorr thickener
- Two 21-ft. Dorr thickeners

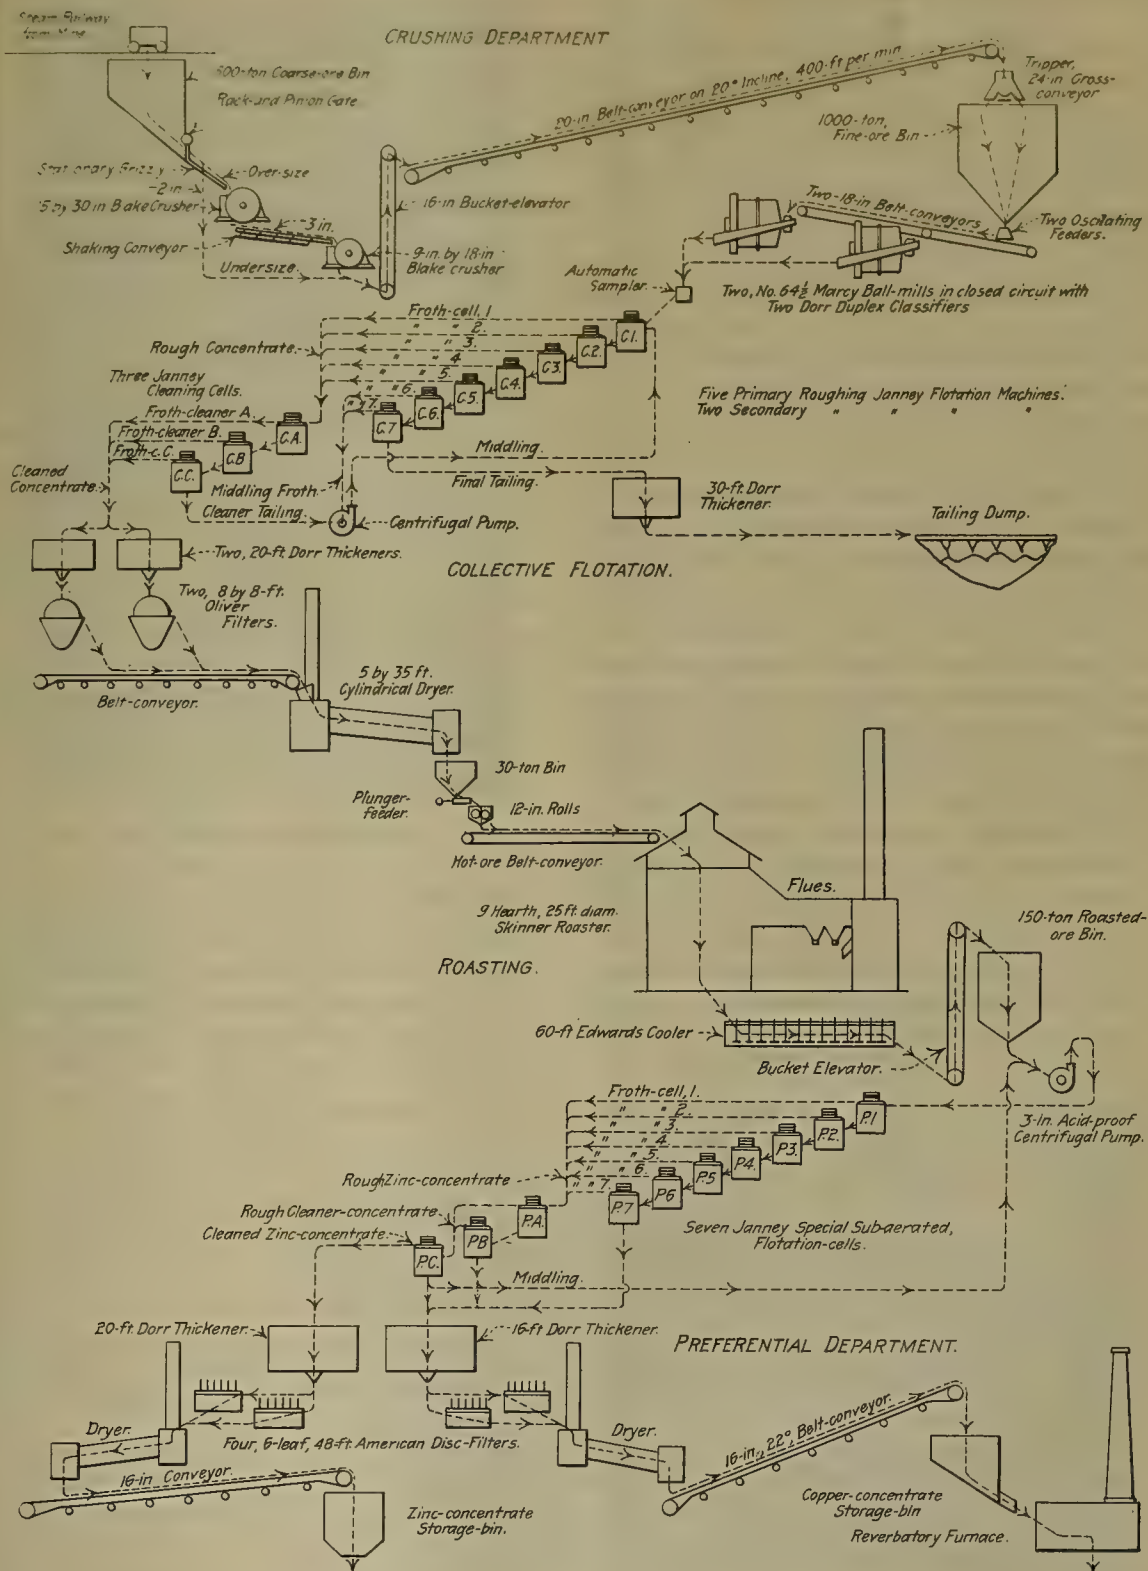

- Two 16-ft. Dorr thickeners
- 20 Janney sub-aerated flotation machines
- Two 8 by 8-ft. Oliver filters
- Three 30 by 5-ft. cylindrical dryers
- One 25-ft. 9-hearth Skinner roaster
- One 60-ft. Edwards cooler
- Four 4-ft. 6-disc American filters.

THE TONNAGE treated is a minimum of 275 per day, with a maximum of 400 tons. This produces about 150 tons of collective concentrate or a ratio of concentration of about 2:1. This collective concentrate when treated preferentially gives 60 tons of copper concentrate to 90 tons of zinc concentrate.

THE CRUSHING PLANT is at the bottom of the mill, to allow of sufficient grade for the railroad from the mine. The ore is dumped into a 500-ton bin, from which it is drawn through a heavy rack-and-pinion gate, with counterweights to permit ease of operation. A grizzly-feeder was originally installed but owing to insufficient space it was rejected. After passing over a stationary grizzly with 2-inch openings, the ore is crushed to 3 inches by a 15 by 30-in. Blake crusher. The discharge is conveyed by a shaking conveyor to a 9 by 18-in. Blake crusher. This conveyor replaced a shaking grizzly, which proved a failure on account of the tough character of the ore, which breaks into pointed and angular pieces, tending to clog the grizzly. The discharge of the 9 by 18 Blake joins the material from the 2-inch grizzly and is elevated 50 ft. in a 16-in. bucket-elevator to a 20-inch conveyor 220 ft. long and running at 400 ft. per minute on an incline of 20°. This conveyor discharges onto a cross-conveyor, which in turn discharges through a tripper into a 1000-ton ore-bin at the top of the mill. A shuttle-conveyor, originally ordered to take the place of the cross-conveyor, was held up on account of war orders. A sampling-plant was provided in the crusher-building, but, owing to the inability to obtain the equipment at the time, it was thought advisable to do the sampling ahead of flotation.

GRINDING. From the bins the ore is drawn through two oscillating feeders and is fed by short conveyors to two No. 64½ Marcy ball-mills each running in closed circuit with a Dorr duplex classifier. The classification is good. Each mill handles about 160 tons per 24 hours. Owing to the high specific gravity of the ore, the classifier is run at a speed of 30 strokes per minute. About 800 tons of material per day is returned to the mill by the Dorr classifier, making a total of about 1000 tons of material passing through the ball-mill in 24 hours. To each mill approximately 11 gallons of water per minute is added, and the water added at the mill-discharge and classifier amounts to 37 gallons.

The reagents for collective flotation are added at the head of each ball-mill by means of disc-feeders. One Marcy mill is left-handed and the other right. Each is driven by a 125-hp. motor through a Lenix drive with endless leather belt. These drives give little or no trouble. Five-inch forged chrome-steel balls are used, and the mills operate at 28 r.p.m.

FLOW-SHEET OF HORWOOD PROCESS IN THE AFTERTHOUGHT MILL

The following is a typical screen-analysis:

| | Ball-mill discharge | | Classifier overflow | | Classifier sand | |
|----------------|---------------------|----------|---------------------|----------|-----------------|----------|
| | 25.4% water | | 65% water | | 15.6% water | |
| | 3.06% Cu | 17.8% Zn | 2.86% Cu | 17.4% Zn | 3.16% Cu | 20.4% Zn |
| | 953 tons | | 150 tons | | 803 tons | |
| Mesh | % Indiv. | % Accum. | % Indiv. | % Accum. | % Indiv. | % Accum. |
| Plus | 10..... | 6.14 | 6.14 | | 7.58 | 7.58 |
| 10- 20..... | 11.27 | 17.41 | | | 16.58 | 24.15 |
| 20- 30..... | 12.30 | 29.71 | | | 11.18 | 35.34 |
| 30- 40..... | 12.91 | 43.62 | 0.56 | 0.56 | 20.00 | 55.34 |
| 40- 60..... | 15.30 | 58.92 | 4.43 | 4.99 | 15.16 | 70.50 |
| 60- 80..... | 7.18 | 66.10 | 4.98 | 9.97 | 10.17 | 80.67 |
| 80-100..... | 6.13 | 72.23 | 8.29 | 18.26 | 6.18 | 86.85 |
| 100-150..... | 3.80 | 76.03 | 9.40 | 27.66 | 4.57 | 91.42 |
| 150-200..... | 4.60 | 80.63 | 4.98 | 32.64 | 2.59 | 94.01 |
| Minus 200..... | 20.00 | 100.63 | 67.36 | 100.00 | 5.98 | 99.99 |

COLLECTIVE FLOTATION. After leaving the classifier the pulp is sampled automatically and then goes direct to 10 sub-aerated Janney machines, ten per unit. Each unit consists of seven roughers and three cleaners. There is ample room in the mill-building for another unit of flotation cells. With the first equipment two Janney emulsifiers were used per unit; they were re-modeled into cells similar to the standard Janney machine.

The flow is so arranged that concentrate may be taken direct from the first two Janneys and sent to the storage tanks or they may go to the cleaners. The froth from the last two roughing-cells may go either to the cleaners or be returned to the head of the roughing-cells. The rough concentrate may be cleaned in three Janneys or cleaned in two and re-cleaned in a third. The tailing from the cleaners is returned to the head of the mill by means of three-inch sand-pumps arranged in duplicate. These pumps replaced an elevator, which gave considerable trouble on account of the accumulation of froth.

In all preliminary tests it was necessary to use acid, the consumption of which was prohibitive on account of the lime in the ore. Finally an oil (Barrett No. 609) was found that gave good results without acid; it had both collecting and frothing qualities. This oil was the one most generally used during 1917 and the first part of 1918. It is undoubtedly a coal-tar creosote mixture containing some phenol, in cold weather throwing down a precipitate that is some naphthalene compound. Without this precipitate in solution the No. 609 oil gives poor results. Through small-scale experimentation with various oils it was found that a mixture of stove-oil with Pensacola No. 80 gave even better results, besides being a cheaper mixture. The oil is stored in a house above the mill and flows by gravity to the feeders at the ball-mills. Oils as well as other mill-supplies are carried up by means of an electrically operated incline tram running the full length of the buildings. In the use of this last mixture it will be found advantageous to add the stove-oil at the ball-mills and the frother by a step-oiling system to the various flotation cells.

It was found that results could not be improved by separating sand and slime, and treating each individually as is done in some plants. The ratio of concentration on the collective cells is about 2:1. Owing to the trouble caused in the roasting, it is not advisable to obtain a concentrate too high in sulphides. The ore without a certain amount of silica roasts too quickly and in so doing partly films some of the sphalerite, causing

poor results from preferential flotation. The point at which it is desired to hold the collective concentrate is about as follows: 30% zinc, 6% copper, 18% iron, 10% insoluble, 6% alumina, 4% lime, or, in other words, about 20% gangue. On the other hand, too low-grade a concentrate gives a low-grade copper product in preferential work.

In the collective department the recovery of copper is about 90% and of the zinc about 85%. The first few cells of collective concentrate show higher copper and lower zinc contents than the last few cells; and this, together with the recovery, points to the fact that the copper sulphides are more easily floated than the zinc sulphide, with a decided preferential action for the former. If the collecting-oil is not added at the ball-mill the recovery suffers immediately. For this reason laboratory results do not come up to mill results, when the oils are added to the test-machine.

The cleaned collective froth, containing 25% solid, goes to two 21-ft. Dorr thickeners. Sprays are used to break down any froth that accumulates on the thickeners. The overflow from the thickeners contains 2% solid and is returned to the mill-circuit. The thickener discharge, which contains 75% solid, runs by gravity to two 8 by 8-ft. Oliver filters. These filters discharge a cake averaging 15% moisture. The use of steam decreased this moisture slightly and increased the tonnage of each filter about 17%.

DRYING AND ROASTING. The filter-cake falls upon a belt-conveyor, which carries the concentrate to the drying-plant. The dryer is of the cylindrical type, 30 ft. long by 5 ft. in diameter. Oil is used for fuel. The attendance required is small, the filter operator having the dryer plant under his supervision. The dryer is efficient and the cost of drying is low. The average moisture in the dried product is 5%. Care must be exercised that it does not get below this, otherwise the discharge will be too hot, and cause trouble not only in feeding, but will tend to burn the belt-conveyor carrying the material to the roaster.

The dryer discharges into a 30-ton hopper. From this it is drawn by a plunger-feeder onto the roaster belt-conveyor. The plunger feeder replaced one of the disc type, as the hot concentrate tended to flow and give an unsteady feed to the roaster. The belt-conveyor passes through two rolls to ensure the breaking of the lumps formed in drying.

Flue losses in the dryer are small, about ten tons being collected monthly. With a sticky concentrate the dryer tends to clog, necessitating hammering occasionally with a mallet from the outside. The placing of short chains in the dryer would prevent this trouble.

The concentrate from the dryer is fed to the top, or drying hearth, of a 25-ft. 9-hearth Wedge type Skinner roaster. This roaster has a speed of approximately one revolution per minute. Mechanical trouble was practically nil during a year's run. For a long time it was thought that the success of the entire process lay in the roasting, and more attention was given to this than to

ENTRANCE TO ADIT

any other operation. It was finally discovered that the roasting was not as important as believed, but that regardless of how good the roast was, unless the ore was properly cooled, results would be poor. With the right kind of cooling there is a range of temperature on which successful roasting could be ensured.

As originally built each hearth was completely bricked in, with the exception of two doors. This, it was found, made the roaster hard to regulate, and held too much heat, causing a high temperature, which oxidized the blende. The brick on the lower five hearths was removed and replaced with sheet-iron doors, which give more radiation and facilitate control. With a Wedge, or similar iron-sheeted roaster, it would have been impossible to do this. At the same time a vertical gas-offtake was installed so that the heat and gas could be drawn from one or all hearths, permitting rapid cooling of the roaster

in case of too high a temperature. This proved most useful.

No troubles being traced to the cooler and thinking that poor results at the start were due to too long a roast, it was decided to feed the concentrate on the fifth hearth. Later this was changed back to the ninth again. Also, in first starting the roaster heat was applied through the muffles, but as it was necessary to put on or take off the heat quickly at times, this was not satisfactory, and the fire was applied directly to the hearths.

Under this system good results were obtained when treating only 75 tons of concentrate per day. The heat was applied on the seventh hearth by means of oil-burners. An auxiliary burner was kept on the fifth hearth. The fuel could be turned off for days at a time, after having once heated up the furnace to the proper temperature, but it was found that a better control could be maintained with a constant light fire. On this small tonnage No. 8 and 9 hearths would be dark; No. 7 a glowing red; six a cherry-red; five a very dull red; on No. 4 the red color could just be seen; No. 3, 2, and 1 were black. Under these conditions the concentrate was receiving its oxidation on the lower hearths of the roaster, the doors of hearths No. 1, 2, 3, and 4 being wide open the greater part of the time. But there was still trouble in keeping the lower part of the hearth cool; this was finally corrected on a 75-ton basis, but when treating 150 tons of concentrate per day (the output of the concentrator) it was practically impossible to keep the lower hearths cool. The color of the roast after cooling varied from straw-yellow to black, a so-called perfect roast being of a reddish brown color, by reason of the mixture of red oxides of copper and iron with the gray-black sphalerite.

In test-work it was found that if the concentrate was properly roasted, and left to cool gradually, the copper and iron would get the right amount of oxidation and have the characteristic brown color, but if after roasting it was dumped on a cold bucking-board the concentrate

THE AFTERTHOUGHT MILL

would have a black color and when put in a flotation machine the copper and iron as well as the zinc would float, the preferential action being killed entirely. Many theories were advanced as to the exact cause of this. The first was that the copper and iron in roasting had become slightly oxidized and that in chilling this film was cracked, exposing the copper and iron sulphides. The second theory was that magnetic sulphides of iron and copper together with magnetite were formed (as the whole mass was magnetic), and that this was the cause of the concentrate floating (magnetite being more or less floatable).

After these tests had been made, samples of the roasted product were taken and cooled slowly; this gave good preferential results; so everything pointed to the fact that most of the trouble was in the cooling. The concentrate at this time was going through a 20-ft. Baker cooler, taking about three minutes to travel from the intake to the discharge. In cutting down the speed to give the concentrate a longer cooling it was found that the discharge tended to bank up. A helix was then put in, and by cutting down the speed of the cooler the concentrate was held 11 minutes. As cold water was being run into the cooler-vat, someone suggested that we "heat the cooler," and this was tried by letting the water come to a temperature of 90°, holding it at this point. The retardation of the cooling gave better results at once. A still further improvement was made by blowing air through the cooler; this tended to expel the sulphur di-oxide and gave the warm concentrate fresh air for oxidation. However, on a 150-ton basis, when the entire hearth-area had to be used for roasting and none could be used for cooling, the discharge was too hot for the cooling capacity. If the heat was held at the upper part of the roaster the concentrate discharged in a partly roasted condition. The only thing that was now needed was more cooling capacity and Mr. Milliken at once undertook to build a 120-ft. Edwards cooler. At the same time he installed an automatic recording pyrometer, which gave a record of the heat of all hearths at all times. The temperature of the hearths for obtaining good roasts should be not more than 920°F. on the hottest hearth (4th from the top) to 400°, or lower if possible, on the bottom hearth.

More or less copper sulphate was formed during roasting. When the ore was chilled there was but a trace, but with over-roasted ore the copper sulphate was at its maximum. By taking the best roasts and determining the sulphate, the proper amount of sulphating for a good roast was obtained. Every hour it was the duty of the roaster attendant to make a colorimetric analysis of the roaster discharge. A peculiar fact about the sulphating was that the proper roast gave the right amount of sulphating for good flotation work, for it was found that, regardless of the roast, if this copper sulphate was removed the preferential results would be poor. The copper sulphate evidently helps the flotation of the zinc, besides keeping down the copper. The following is a comparative test:

Oils: 50% fuel, 50% P. T. & T. No. 80.
Ore: 40 minute dull-red roast.
Temperature flotation: 60°F.
Test No. 1. Soluble, contents filtered out.
Test No. 2. Soluble contents retained.

| | Weight Gm. | Assays | | Recoveries | |
|-----------------------|---------------|--------|------|------------|------|
| | | Cu | Zn | Cu | Zn |
| | | % | % | % | % |
| Copper concentrate... | 167 | 6.80 | 38.2 | 67.2 | 67.4 |

| Test #2 | | | | | |
| Copper concentrate... | 136 | 9.12 | 13.1 | 68.6 | 20.3 |
| Zinc concentrate..... | 157 | 3.62 | 44.6 | 31.4 | 79.7 |

For a long time the sulphur burnt off in roasting was as high as 50%, which meant that more or less of the blende was affected. This was soon remedied.

Under roasting, I have endeavored to give the most important of the metallurgical troubles encountered, all of which were finally overcome. What should be the proper roast it became hard to determine, because at times when it was thought that the roast was good the results were poor and the reverse was equally true. For the first few months there were times when the roaster became white-hot, then in cooling it would chill too quickly. Again, notwithstanding the good ventilation of the roaster-building and frequent cleaning of the flues, the sulphur gas was so strong that one could hardly enter the building without a mask. The following is a set of instructions issued to the roaster attendants:

A. If for any reason roaster is stopped, have rabbles pointing in a NW-SE direction out of line of the burner flames.

B. If sulphides are burning in screw-conveyor leading to cooler or if roaster-discharge is red, it means that the heat is too low in the roaster. The heat may be brought up

1st. By increasing fires on 7th hearth.

2nd. By cutting down amount of feed to roaster.

3rd. If serious, by ringing off feed, stopping roasters for two minutes at a time and turning one revolution, wait two minutes, etc.

C. Size of fire: Do not change without authority of shift-foreman.

D. Sulphating: Color No. 2 best. Test every hour.

E. Panning-tests. Make one every hour. Compare with good roasts.

F. If panning-tests vary much from the brown color desired, report same at once to shift-foreman.

G. Look at all seals at least once on a shift.

H. Do not open or close doors without orders from shift-foreman.

I. Oiling: Line-shafting twice per shift; roaster-bearings once per shift.

J. Power off: Shut off feed and lower fires. Turn roaster once every five minutes.

K. Empty hearths denote clogged seals.

L. Do not go to top of roaster without mask or respirator.

M. Do not let level of cooling-water get below overflow.

N. Cooling-water should be steaming slightly.

PREFERENTIAL FLOTATION. The roaster discharge, after going through a mechanical scraper for removal of lumps, passed through the cooler and was then elevated to a conveyor running to the top of the mill, where it discharged into a sludge-tank, water being added before drawing it out to the flotation machines. Owing to

the high dust-losses this method of conveying was discarded and a pumping system installed, using three lifts of 80 ft. each with two-inch Krogh sand-pumps in duplicate. Trouble was caused by the presence of copper sulphate; this was overcome to a great extent by the use of wood-stave pipe-lines and corrosion liners, with aluminum bronze impellers for the pumps. The liners were imbedded in cement. This pulp then went through seven roughing and three cleaning Janneys. Here also sulphating caused trouble. The copper sulphate would precipitate on, and eat out, the return-pipes, liners, housings, and impellers. Calcium sulphate would also clog the mats, so that, unless prevented by pounding, the pores of the mats would be closed entirely in a week.

In February 1918 a change was made in the design of the Janney machines by making the liners and cells entirely of wood, with spitzkasten similar in design to the mechanical Janney, but much shallower, so that there was but a foot lift from the bottom of the 'spitz' to the cell. The return from the spitzkasten to the cell was also made of wood. The large 45 by 45-in. iron air-pans were then cut in three pieces, each 15 by 45 in., and one placed in each spitzkasten on an angle, below the discharge from the cell. These mats could then be lifted out readily in case of a choke-up, or if the mats needed renewing. Air entered the top of the mat instead of from the bottom. The impellers were made of bronze. These machines worked so well that it was decided to install a Minerals Separation machine similar in design near the roaster, so as to avoid elevating the roasted product, at the same time giving more capacity for the collective flotation.

The reason for the installation of the Minerals Separation machine was that it was thought that there would be more ease of operation, because all the cells would be in view of the operator at one time, and the flotation of the roasted product could thus be controlled more easily. The Janneys, as remodeled in the main mill, had given excellent results when the concentrate was properly roasted, and cooled, but there was considerable expense in pumping the pulp 300 ft. to the top of the mill, and the preferential flotation Janneys were not compact enough. By installing the M. S. machine near the roaster a better control could be had, while the Janneys could be used for collective flotation. In this particular case the Minerals Separation machine fell down, first because of the capacity of the machine and second because of the lack of agitation. The agitation given by the Janneys, even though so much greater than that obtained by the M. S. machine, was not sufficient alone to give good results on the first cells, and without some method of cleaning the zinc particles by pumping or emulsifiers at the head of the Janneys the best concentrate would not appear until the third or fourth cell. With the M. S. machine the only time any froth at all was formed—and then it appeared very much over-oiled, owing to lack of agitation—was when the concentrate was a little under-roasted. With this pulp under the old conditions, the Janneys could have yielded a froth that would have

buried the mill. It is absolutely necessary to have a sub-aerated type of machine, in that the froth formed is slow-moving, and must be removed as soon as formed. With sufficient pre-agitation and the use of sub-aerated acid-proof Janney machines as remodeled at the Afterthought mill excellent results should be obtained with the roasted product as obtained under the conditions as finally perfected.

At first acid and heat were used in preferential work with G. N. S. No. 8 and 28 oils. After much testing, suitable oils were found giving better results and not requiring either acid or heat. Approximately 4 pounds of oil per ton of ore is used.

Flotation results varied with roasting and cooling conditions. At times there was no froth at all, and then again there was so much froth that it could not be handled. An over-roast gave a thin brittle yellowish-brown froth; an under-roast a high voluminous gray froth. A chilled roast gave a fluffy high jet-black froth, while a good roast was of a brownish-black color. Under proper conditions the zinc concentrate was gray, and the copper concentrate a brilliant red. Analysis of the products produced by preferential flotation are about as follows:

Zinc concentrate—2.6% copper, 47.1% zinc, 4.2% iron, 3.3% barite, 4.4% lime, 3.8% alumina, and 3.2% silica.

Copper concentrate—7.2% copper, 12.3% zinc, 23.4% iron, 8.2% barite, 10.7% lime, 10.5% alumina, and 10.4% silica.

There is about eight ounces of silver per ton of each concentrate. These results should be considerably improved by the new cooling system, as tests on a properly cooled ore have given as high as a 55% zinc concentrate, and a 10% copper concentrate containing but 5% zinc.

THICKENING, FILTERING, AND DRYING. Two 16-ft. Dorr thickeners are provided for the zinc and copper concentrates. From each of these thickeners the pulp is drawn to one of four 6-leaf 4-ft. American filters—two for the copper and two for the zinc concentrate. The pulp to the filters contains about 25% moisture and is dewatered to 15%. The American is the only type of filter that could be used economically on these concentrates on account of the calcium sulphate present; this quickly closes the pores of the canvas. The life of the canvas filtering-bags is not more than two weeks, but the bags are cheap and can be changed by the attendant while the filters are in operation. With a drum type of filter it would be impracticable to change a cloth every ten days. From the filters the concentrate is conveyed to cylindrical dryers, of which there are two, similar to the collective dryer. These dryers discharge into storage-bins. The copper concentrate is treated locally and the zinc concentrate is sent to Oklahoma.

Tailing from the collective department is partly dewatered in a 30-ft. Dorr thickener. The dewatered tailing is run to a dam modeled after the Inspiration system, placed in a canyon adjacent to the mill. The tailing-launder as it passes over the dam has 18-in. cones every ten feet, which thickens the dam-building material. The

overflow from these cones settles ahead of the dam, and the water is drawn off clear in order to avoid pollution of the stream.

COSTS. Although there are not enough data available as to what the exact operating cost of the Horwood process would be on 300-ton basis, from costs of the process obtained during the spring of 1918, the following would be a close estimate:

| Cost per ton | Cost per ton |
|-------------------------------|-----------------------------|
| Coarse crushing | Assaying |
| Sampling | Lighting and heating..... |
| Elevating and conveying.... | Supervision |
| Fine-grinding and classifica- | Drying |
| tion | General |
| Collective flotation | Maintenance and buildings.. |
| Preferential flotation | Plant and machinery repairs |
| Pumping | Royalty |
| Filtering | Total |
| Roasting and cooling..... | |
| Tailing-disposal | |

CONCLUSION. Considering how little was known concerning the Horwood process as applied to a copper-iron-zinc ore, rapid progress has been made with this system at the Afterthought mine. The plant ran intermittently for over a year, and shut-downs were only made to improve the practice and install machinery, until the drop in price of the metals and development of the electrolytic process showed that this latter process would be best on this ore. With a high power-rate, which would make the electrolytic method out of the question, or with a cheaper freight-rate and higher metal-prices, undoubtedly the Horwood process as developed at the Afterthought mine would be best suited to this ore.

The flow-sheet now has the same outline as when the plant was first started. The most important improvements made were in the kind and cost of reagents; the steady regulation of the roaster for a low temperature; the removal of lumps from the feed to the roaster and from the feed to preferential flotation; a change in the method of cooling; and in the position of the preferential plant; the drying of the copper and zinc concentrates, and the local treatment of the copper concentrate.

The field for the Horwood process today is limited, since on ores upon which fairly good results may be obtained by gravity or gravity and flotation methods the Horwood process could not compete. The same is true of a complex ore where the electrolytic process is practicable. Notwithstanding recent developments of the Bradford and allied processes, and the higher initial and operating costs of the Horwood, there is no doubt that the Horwood process will give better results in some cases than can be expected with the wet preferential methods.

THE Free Gold Pigot Bay Mining Co. was incorporated in Valdez, Alaska, recently by a number of local men, the incorporators being B. F. Millard, of Seattle, Washington, and W. R. Millard and C. B. Smith, of Valdez, the object being to conduct and carry on the business of mining, milling, and smelting. The property of the new company is located at Pigot Bay, Prince William Sound. The company is capitalized at \$350,000 and none of the stock is preferred. The number of shares is 350,000, with a par value of one dollar per share.

Tungsten Uses and Minerals

Tungsten is used chiefly as an alloy with iron and carbon, in the production of the so-called 'high-speed' steels. These steels contain from about 13 to 20% of tungsten and usually a certain amount of chromium, and because of the fact that they do not lose their temper at a dull-red heat as do ordinary steels, it is possible to run lathes using tungsten-steel cutting tools five times as fast as with ordinary steel tools. This property of tungsten-steels has had a revolutionary effect in machine-shop work, increasing the output and consequently cheapening production of all kinds of machined parts in automobiles, tractors, locomotives, and the like. Tungsten is also used alloyed with steel in permanent magnets, as it causes the magnets to retain their strength much longer than they otherwise would. Another use is for the filaments of incandescent electric lamps. When used in this way it is usually alloyed with the element thorium which prevents the filament from crystallizing and breaking as it otherwise tends to do. A tungsten filament lamp uses far less electricity for the same amount of light than a carbon filament lamp and by the use of these lamps millions of dollars are saved annually. Tungsten has been used to a slight extent in the manufacture of crucibles for use in vacuum furnaces. By far the larger part of all tungsten mined, however, is utilized in the manufacture of the 'high-speed' steels.

Tungsten is by no means a common element in the earth's crust, it being usually classed among the rarer metals. It occurs in nature in the following minerals:

Scheelite, CaWO_4 (calcium tungstate). Scheelite occurs in quartz veins, associated often with gold and with pyrite, in contact metamorphic deposits, in crystalline rocks, and occasionally in placers derived from one of the above.

Wolframite, $(\text{FeMn})\text{WO}_4$ (iron manganese tungstate). Its occurrence is similar to that of scheelite, and it is typical of the deep or high temperature zone of vein or mineral formation.

Ferberite and Hübnerite. These are less common tungsten minerals than the two preceding, and either of them grades into wolframite. Ferberite is iron tungstate, FeWO_4 , and hübnerite is manganese tungstate, MnWO_4 .

Tungstite or Tungstic Ocher. A yellow powder having the chemical formula of $\text{WO}_3 \cdot 2\text{H}_2\text{O}$. There is no record of this mineral being mined as an ore of tungsten to any extent.

Stolzite, PbWO_4 , and **Cuprotungstite**, CuWO_4 or $(\text{CaCu})\text{WO}_4$ are rare minerals, not known to occur in commercial amounts.—D. C. Livingston, in Bulletin No. 2 of the University of Idaho School of Mines.

THE output of Japanese coal mines during the last seven years was, in tons, as follows: In 1912, 15,709,663; 1913, 17,050,267; 1914, 17,289,861; 1915, 15,488,828; 1916, 17,476,803; 1917, 19,887,147; and 1918, 20,835,254.

OATS ON RECLAIMED LAND

A CROP OF BARLEY

'Opportunity': The Anaconda Company's Farm for Employees

By OLIVER E. JAGER

On the human side of mining much has been written, but it is safe to say that the amount of discussion and theorizing is far in excess of the practical efforts put forward to improve the living conditions of employees at mines and smelters. That this statement is being gradually refuted is admitted, as practice is every year catching up with theory. It is therefore of interest to the profession in general, and to the large corporations in particular, to describe an actual accomplishment on a scale sufficiently large to demonstrate the practicability of the scheme and the value of the results obtained. It is unnecessary to enlarge on the value of the contented worker, the 'steady' man, although there are some managers who fail to realize the actual money loss of chronic 'hiring and firing'; nor need mention be made of the merits of good citizenship, especially in these days of unrest, doubt, and various 'isms' with names both foreign and domestic. Suffice it to say that any plan is meritorious whose fundamental principles tend to produce a general improvement in the conditions of life, to make a man a better citizen by giving him a stake in the community and a home of his own, and last, but not least, to provide means for the individual production of food by means of farming on small tracts. With these principles in view, and following its general policy of taking care of steady employees, the Anaconda Copper Mining Co. established a farming settlement known as Opportunity, situated in Deer Lodge valley, Montana, $7\frac{1}{2}$ miles east of the city of Anaconda. Another motive for throwing open this area for settlement was the hope, to a certain extent, of relieving congestion in the city.

That many employees were desirous of settling on the

land was demonstrated by the fact that the Farms Department of the company had been frequently approached with requests for small tracts of tillable land in the vicinity of the smelter, where gardens could be grown, chickens and hogs kept, and a cow maintained. This gave a clue to the size of holding desired, but before any settlement could be started, nearly three years were spent in preparing the land. The history of this period is interesting, because it gives an idea of the amount of work done by the company in overcoming the natural defects of this portion of Deer Lodge valley.

The character of the country immediately adjacent to Anaconda and to the works, on account of the fact that it was a boulder-wash unsuitable for agriculture, made it necessary to go some distance to secure an area of land adapted to the purpose. There was, immediately east of the smelter and reached by wagon-road from Anaconda, an area of several thousand acres that formerly, when the country was first settled, had been natural wild hay and meadow land. In consequence of the irrigation of the higher ground, these meadows had become a swamp, unsuited to agriculture and in several places such quagmires had formed that fences had been erected to save livestock from being lost. It was decided to acquire these areas, which were alluvial deposits, formed partly during old Glacial conditions, but principally by beaver-dam action and the consequent silting accompanying the labors of these industrious little builders.

The first problem was to drain the land, which, on account of the sloping nature of the country, called for a special system. Parallel lines of 12-in. tile, spaced 1000 to 1200 feet apart, were put in at a depth of from six to

seven feet, in order to secure a rapid and free movement of water from the surrounding beds of gravel. These 12-in. lines emptied either into open ditches or into 24-in. lines, and performed their work so well, that, within a few months after the installation of this drainage system, it was possible to enter upon these lands with heavy traction machinery and reclaim them.

On account of the peaty character of the ground—caused by its long-continued swampy condition—the usual agricultural machinery was inadequate for cultivation. It became necessary to develop a special type of machine, which consisted of a large rotating cylinder, armed with heavy teeth, capable of tearing up the peat and brush-roots, leaving them in such a condition that it was then possible to burn over the entire area and get rid of the excessive peat, alder and willow roots, and stumps. Two years of experimenting was necessary to develop a suitable type of rotary cultivator. The difficulty of breaking up the ground is best illustrated by referring to the power used in the operation, as it took three 60-hp. tractors to drag the machine, the power of the last tractor being employed mostly for rotating the toothed cylinder. The preparation of the ground for farming purposes was completed by modern tillage machinery, that is, by plows, discs, and harrows.

There was thus prepared about 1000 acres, which was divided into tracts of from 5 to 10 acres, though there are a few odd lots of 2½ acres. The standard tract of 10 acres is 435 ft. wide by 1000 ft. long, all tracts having a street in front and an alley in the rear. It may be stated at this point that should the settlement be expanded, there are several thousand acres of land available in the vicinity. A system of irrigation was provided whereby water was delivered in ditches owned by the company to the corner of the tract, and a contract was made for the perpetual supply of these lands with irrigating water on a basis similar to that followed in Government and private irrigation projects. Provision is also made to pump water from the tile-lines onto the land, should a series of dry seasons intervene.

The tracts were sold to employees of the company on a basis of 30 monthly installments with deferred payments at 6%, or for cash. Unlike a real-estate project, this scheme was not in any sense developed with the idea of profit, but rather to provide prospective home-owners with land at the approximate cost of purchase and improvement. The cost of purchasing, draining, breaking, and the withdrawal of approximately 10% of the area for streets, alleys, and park, made this land cost between \$90 and \$100 per acre. The land was sold at from \$75 to \$125 per acre, depending on location and desirability, and the company has had a small loss per acre over and above the returns from the sales. The Deer Lodge Valley Farms Co. is the name of the organization handling the land. It makes a contract with the purchaser for the conveyance of the property, subject to the usual restrictions contained in such instruments. The terms are in no sense hard; they are meant to be fair to the purchaser, and provide for preserving the improvements, good ap-

pearance, home-like character, and morality of the area. One clause in the contract provides that in case of the death of a purchaser before the completion of his payments, his wife or child will be given a clear title to the tract in question without further payment. There is no record of any purchaser losing his tract by default. The first lot was sold in 1913; by the end of 1916 the tracts were practically all occupied. Since the area was thrown open for settlement, the value of the land has increased by from 30 to 50%.

At first, the Farms Department of the company maintained teams, men, and equipment for doing a considerable part of the heavy work on these little tracts in connection with plowing, harrowing, sowing, and harvesting grain. About 90% of this work at the start was done by company men and equipment, but gradually, as the residents have purchased horses and farm-machinery themselves, and as certain individuals in the community have started to undertake this kind of work, it has been possible to eliminate almost entirely this service on the part of the company. A charge was made at the rates current in that part of the country. The land is suitable for raising oats, barley, and garden-truck, and some hay is grown for fodder. Cows, chickens, and rabbits are raised, the company providing a pasture for cows at a low rate.

With the idea of assisting the building of homes, lumber was furnished to the residents of Opportunity at mill-cost plus a small charge for handling. The cost of the homes erected varies from \$1000 to \$2000. Through the generosity and public-spiritedness of the Daly Bank & Trust Co. of Anaconda, arrangements have been made whereby, at a rate of interest considerably less than the current rate, funds have been loaned to tract-owners to assist in supplying the necessary money for buildings and improvements. No definite plan is followed in making these loans, each individual case being considered on its merits. The loans are re-paid on an installment basis, similar to the installment plan upon which land is purchased.

A plentiful supply of good water for household purposes is obtained by sinking a well to a depth varying from 4 to 20 ft. Some homes have been equipped with a small pumping and pressure set, so that water can be piped through the house in the usual way. Individual sewerage is installed with the usual septic tanks, which give no trouble. On account of the heavy flow of ground-water and the nature of the strata, there is no danger of contaminating the drinking-water. Coal-chutes and sheds have been installed, and coal and wood sold for the convenience of the community. At present about one hundred families have settled at Opportunity.

The company also arranged to have two or three small schools in the adjoining district abandoned, and at their own expense erected a modern school-building, supplanting these country-schools, thereby enabling the community to establish a graded school. Children from outlying districts are picked up daily by automobile or street-car, to be taken to and from school. About 120 children

ONE OF THE HOMES AT OPPORTUNITY

PLOUGHING WITH TRACTOR

are in attendance at the school, which is included in the Anaconda school-district and is under city supervision.

In addition to this, the company completed a street-car system from Anaconda to Opportunity, connecting with the line to the smelter, giving a service of 12 cars daily each way. This service is timed for the accommodation of men going to and returning from work, for people going to town to shop or to public entertainments in the evening, and for the convenience of the school. This car-service has been rendered for a flat rate of five cents, the School Board defraying the cost of children who have to come to school by street-car, and also that of the children from outside communities who come to the Opportunity school by automobile. There is a tri-weekly delivery from stores in Anaconda.

Home-builders in Opportunity are not confined to any one class of employee, but include all grades, from laborer to superintendent. An instance could be given where a man came in, figuratively with a \$10 bill, and who now owns his own home and a tract of land worth \$2000. It should be explained that not all the residents of Opportunity are cultivating their ground, or at least not to its full extent, some being content to regard their holding as a home in the country. The amount of produce obtained from a tract is directly proportional to the work done on it. One man will have 1000 chickens this summer. Others are keeping cows and making money selling cottage-cheese, while hogs are the principal product of other tracts. The man starting with a small capital builds himself a shack, and gets a pig or some chickens. He endeavors to raise enough crops on his land to feed his animals, and carry on in a small way, saving money, till he can increase his investment and enlarge his sphere of operations, as there is no difficulty in selling the farm produce. About this time a loan from the bank will enable him to replace the shack by a good house. Of course, it is not quite so simple as it appears, but it can be done if a man will work.

Running through the community there are three streams, and on either side of the banks a strip of from 30 to 50 ft. has been reserved in perpetuity for the benefit and enjoyment of the people. In addition to this, a 65-acre park tract has been permanently reserved, which, with the completion of the development will be approximately in its centre. There is a wooded mountain stream running through the entire length. The school-house has been erected in the park, and no single benefit that this community has bestowed upon its residents seems greater than the apparent happiness which this attractive little park confers on the children, who can be seen any noon, as soon as school is out, scampering to favorite nooks along the creek to eat their luncheon and play during the recess.

And so the human element comes in once more. Surely, a contented and healthy community, living under healthful conditions and bringing up families in clean surroundings, will produce better citizens than can possibly emerge from the squalid workmen's residential areas of the average mining and industrial centre, where verdure

is absent and where the only crop is a prolific undergrowth of tin-cans and broken bottles.

The Anaconda Copper Mining Co., as the pioneer in this new departure, is to be congratulated on the success of the scheme. It has been largely experimental, but is working out to a successful issue. While it is not here advanced as a panacea for all labor troubles, it shows what can be done in settling the employee on the land near his work. I am indebted to H. C. Gardiner, manager of the Deer Lodge Valley Farms Co., and veterinarian in charge of the Anaconda Copper Mining Co.'s farm and ranch projects, for much of the information herein contained. He has been with the project since its inception, and has contributed, in no small degree, to its success.

Work of Alaska Road Commission

The total mileage on March 1, 1919, of roads and trails was 4830. Of this amount 2866 miles comprised a connected system reaching from Valdez and Chitina to Eagle, Fairbanks, places above the Arctic Circle, to the Lower Yukon, Nome, Candle, and other Seward Peninsula points. This system is joined at several points on the Yukon river by a second system of 2736 miles, which begins at Seward, and serves the Iditarod, Ophir, and Innoko districts. In addition to these two connected systems there are 288 miles of short roads and trails in various parts of the Territory. To March 1, 1919, the total amount expended for all maintenance and construction since January 1905 was \$4,923,596; \$2,355,700 has been spent for maintenance and construction of the Richardson road from Valdez and Chitina to Fairbanks, or approximately \$5770 per mile on the 410 miles. During the past winter automobiles made the 120 miles from Chitina to Meiers in a day; from Meiers to Little Delta sleds were used; and from Little Delta to Fairbanks, 60 miles, autos have been making regular trips all winter. The bulk of the summer traffic on the Richardson road is handled by passenger and freighting automobiles. Although these machines do not make the trip with the same degree of comfort and ease that is possible on the State roads, which cost from \$10,000 per mile and up, they do get through, and with favorable weather conditions the trip from Chitina to Fairbanks, 320 miles, is made in about twenty-four hours running time. When considering road work in this territory it is well to keep in mind the difference between Alaska costs and those obtaining outside. In normal times, outside, \$5 will hire a team and driver one day, and the owner furnishes feed. On much of the Alaska work in the interior it costs \$5 or more to feed one horse one day, and many other costs are in the same proportion. The Bureau of Public Roads and the Forestry Service have joined forces with the Alaska Road Commission to construct roads within the National Forests. The Territorial Legislature passed a progressive road law which provides machinery for the most efficient highway administration through co-operation with the Federal authorities.

REVIEW OF MINING

CALIFORNIA

NEW POWER COMPANY.—MINING IN SHASTA AND SIERRA COUNTIES.

NEVADA COUNTY.—The plans of intended construction and methods of serving the public by the Marysville and Nevada Power & Water Co. have been published. The work of securing water rights has been quietly proceeding for many months past under the supervision of Lars R. Jorgensen, an engineer of San Francisco. The company will enter the field in competition with the Pacific Gas & Electric Co. and the Great Western Power Co. to supply electric current in the fields now served by these two. Later ditches and laterals will be constructed to use the water for irrigation. The work in hand is being devoted to dam construction and securing water rights. The dam is under construction at Bullard's Bar by a San Francisco firm.

The State Water Commission has authorized the publication of the following:

Lars R. Jorgensen, San Francisco, applies for 275 cubic feet per second of the waters of the North Fork Yuba river, 25 cubic feet per second from middle fork of North Fork, and 50 cubic feet per second from north fork of North Fork Yuba river, Sierra county, tributary Yuba river, for power purposes. Diversion works consist of concrete arch dam 140 ft. high, 400 ft. long on top, and 100 ft. long on bottom, and two main canals 13 and 9 miles long, respectively. The application provides for the storage of 80,000 acre-feet. Construction work will begin on or before January, 1921, and be completed in January, 1924. The water will be returned to North Fork Yuba river after use. Estimated cost \$4,000,000. (Allowed 6 months from May 13 to file maps). Lars R. Jorgensen, San Francisco, 400 cubic feet per second of the waters of the North Fork of the Yuba river, a tributary of the Yuba river, Sierra county, for power purposes. A concrete arch dam 85 ft. high, 200 ft. long on top, and 60 ft. long on bottom will be constructed to divert the water into a main conduit four miles long. Construction work will begin in January, 1921, and be completed in January, 1924. Estimated cost, \$1,400,000. The water will be returned to North Fork of the Yuba river after use.

The Pacific Gas & Electric Co. has started extensive improvements upon Lake Van Norden, two miles west of Donner. The plan is to raise the dam 5 ft. and increase the storage capacity. G. C. Wintermute of Tacoma, Washington, has a bond on the Smethurst mine at Brown's Valley, 20 miles west of Grass Valley. The mine

is being pumped out and several men are at work. The Smethurst was formerly a producer.

GRASS VALLEY.—J. F. O'Connor has applied to the State Water Commission for a permit to appropriate 500 cubic feet per second of the waters of Canyon creek and the South Yuba river, with storage of 125,000 acre-feet, for municipal and agricultural purposes. Site of pro-

posed dam not given, but it will be 200 ft. high, 800 ft. long on top, and 400 ft. long on the bottom.

Notice is given of the closing of the charter of the Mine Workers Protective League on July 26.

SHASTA COUNTY.—The Bully Hill Mining Co. has raised wages 50c. per day all around. Miners will now get \$4.50 per day and muckers \$4. Board is \$1 per day. The company employs 60 men. H. R. Hanley, designer and builder of the Mammoth Copper Co.'s zinc plant, has resigned and will go to another camp. Charles A. Hoffmaster, for 15 years purchasing agent for the company, has also resigned to go to the southern part of the State. The Victor Power & Mining Co. has taken over the bond given by E. P. Conner & Son on the Bull Moose mine, which closely adjoins the Victor's claims. The final purchase price is to be \$20,000, and is payable in monthly

installments of \$500. Two Gibson mills are kept running on ore from the Bull Moose and the Midas.

SIERRA COUNTY.—M. E. Beggs and associates have a crew of men clearing at the Kate Hardy quartz mine below Forrest City, preparatory to re-opening. The power line is being re-built and as soon as current is available underground work will commence. The old mine was rich and will be thoroughly prospected.

COLORADO

FURTHER DETAILS OF THE STATE MINES DEVELOPMENT ASSOCIATION.

DENVER.—The result of the gradual decline of the mining industry in Colorado has been a progressive discontinuance of the support that is necessary normally to sustain public interest in mining ventures. About one year ago a few men who had become depressed by the mining situation conceived what is now incorporated as the State Mines Development Association. This is to be an association of persons who have sufficient vital interest in the mining industry to purchase shares of stock in an enterprise that will be pushed for the good of the mining industry without any selfish motives on the part of its promoters. It is believed that an association composed of cash-interested stockholders will do better and more efficient work, to the ultimate good of all concerned, than one in which membership would be gratis. A great amount of hard work was done by the men who conceived the project and the organization is finally assuming its intended function. No benefits will come to the promoters except through the success of legitimate mining undertakings which it is the object of the association to further. No stock has been or will be issued to anyone except for full cash at par value. All revenues thus far collected from the sale of stock have been used in defraying expenses of organization. No extravagant salaries are allowed to the few officials required nor are unusual expenses permitted. If the plans outlined by the organizers are carried through, the entire State will share in the ultimate results. It has not thus far been necessary to raise much capital, and hence no special effort has been made to place subscriptions beyond the needs of the preliminary stages of the project. In fact, up to July 19, no publicity has been given to the association and relatively few persons outside of the mining districts are aware of the movement. Since the mining districts of the State will be directly benefited by the successful outcome of this promotion, these districts were expected to and did enter heartily into the enterprise. To date very little has been said about the association in the cities, although it is presumed that, as plans proceed and the organization requires capital for its activities, business men and bankers throughout the State may wish to become identified with it. The purposes of the association are the development of the State's mining resources, the revival of abandoned mining camps, the exploration of new fields, and the operation of new as well as old properties. As a rule in the

past most small mining promotions have been unable or unwilling to obtain proper technical advice. This association will retain the best engineers available.

The State has been divided into districts, each district organized separately but subsidiary to the parent association. Each subsidiary will recommend the expenditures of money in its vicinity, such recommendations being, however, referred to the central office in Denver for endorsement by the engineering and financing boards. Each district will retain one mining engineer, and the central office will have five engineers who are men of wide reputation. Before any property is acquired it must first be passed upon favorably by the local board of directors and its engineer, and their findings must then be accepted by the central board and engineers. Failures resulting from lack of legitimate engineering advice will thereby be practically eliminated. Seven district associations have been organized, covering the following mining sections of Colorado: (1) Ouray; (2) Silverton; (3) Eagle county; (4) Pitkin county and portion of northern Gunnison county; (5) Chaffee county and north-eastern portion of Gunnison county; (6) Clear Creek, Gilpin county, and north-eastern portion of Summit county; (7) Lake county, Park county, and balance of Summit county. It is proposed to reserve three districts at large for portions of the State that may hereafter come to the front in metal mining. Cripple Creek has not been districted, for the reason that it does not appear that activities have been relaxed there through lack of interest or exploration. The board of each district comprises a president who is usually a city or county official; a vice-president who is a mining man of reputation in his district; a secretary-treasurer who is an officer of a bank in the district; an attorney who is held favorably in his community; and the engineer. Each such district organization is in reality an exploration company. Its function is to decide upon the most promising properties for operation, to make careful examinations of such properties, and to report the findings to the central office. When ten districts have been organized and have performed their functions, there will be at least ten mines in the State under development or operation simultaneously by the parent association. There may be many more than ten. We know that a large proportion of the mining properties that are scientifically selected and operated prove successful. The association aims to eliminate risks insofar as it is humanly possible. Operations will be in diverse districts with different types of ores. The failure of a single venture cannot seriously injure the association as a whole. It is believed that when the association is far enough along to require capital wherewith to purchase desirable properties the money will be readily forthcoming. If money can be made in legitimate conservative mining, there is no reason to doubt the outcome of this co-operative enterprise. It should be stated that none of the organizers of the association has any opportunity to present his own properties for consideration and there are, therefore, no perquisites connected with holding an office. I am reliably informed that no con-

sideration has been given to the exploitation of any particular mine or prospect. The acquisition of properties will be on the same conservative unprejudiced basis as that practised by large exploration companies generally and no mine or property will be considered unless it passes investigation and promises to make good.

NEVADA

GOLDFIELD, TONOPAH, TULE CANYON.

GOLDFIELD.—The Florence Divide lease on the Florence Goldfield has ready for shipment ore estimated to be worth from \$128,000 to \$160,000, the difference in estimates being due to the tenor assigned to the highest grade ore. The ore contains some of the best specimens of high-grade gold ore mined in the history of Goldfield. The vein being mined has a seam of ore on each wall, the rich material, varying in width from one to three feet, being on the foot-wall. On the hanging wall is a seam assaying from \$50 to \$75 and with a high copper content. The gold vein has been opened for a length of 138 ft., the occurrence of the rich ore being erratic. A small stope has been carried for 30 ft. above the 380-ft. level, the remainder of the ore for shipment being secured in development. Twenty men are employed on two shifts, and it is planned to employ another shift in a short time. The lease expires January 1, 1920.

The Goldfield Development Company on July 24 broke 6000 tons of ore assaying \$23.80 in the Red Top. The blast required 350 lb. of dynamite, which was placed in a small drift after the ground had been loosened by small charges placed in six-foot drill holes. The ore is being broken into the old Red Top glory hole from a block 300 ft. long, 60 ft. wide, and extending from the 165-ft. level to the surface. Raising to tap the broken material has commenced. September 1 is the earliest date now fixed for starting the plant, the delay being due to the poor condition in which it was found and the difficulty in securing delivery of machinery. Boulders of gold ore have been found in the drag from a fault at a depth of 910 ft. in the Merger. The discovery was made in a 200-ft. drift on the shale-latite contact. The drift was driven from the 60-ft. west cross-cut from the 910-ft. level of the Spearhead shaft, through which all work in the Merger is being done. Near the fault and in the latite a seam of lead-zinc ore was found, something that is rare in the Goldfield district. Lead and zinc were found in the latite before the rich orebody was found on the contact in the Jumbo Extension. J. W. Dunfee of Goldfield, lessee of the Orleans mine at Hornsilver, will resume work in August from the bottom of the 600-ft. shaft. This lease has a production record of \$260,000 gross, most of the ore being extracted on the 200 and 350-ft. levels. Four carloads of ore have been shipped during the past two weeks from the Nalaskowski lease on the Silver King.

TONOPAH.—The south-east drift on the fifth level of the Tonopah Divide has been driven 80 ft. The face is in rich ore, but assay figures have not been announced by the management. The main cross-cut has reached the

foot-wall, proving the vein to be 35 ft. wide. The south-east drift on the fourth level is 430 ft. long and the face is in ore; the north-west drift on this level is 200 ft. long, but for the past 20 ft. low assays have been obtained. Three hundred feet from the main cross-cut on the third level a cross-cut in the silver vein is to be extended to cut the gold vein. The south-east drift on the second level is 375 ft. long, with the face in high-grade ore. A raise is to be started from this level and if it proves a continuation of the rich ore opened 245 ft. south-east of the main cross-cuts on the second, third, and fourth levels, the 60-ft. south-east drift on the first, or 165-ft. level, will be extended to connect with it. Sinking of the shaft below the fifth level will not be resumed until the lateral work on this level has been well advanced. The Brouger is cross-cutting east on the 177-ft. level to reach the extension of the Divide Ex. vein; a drift is also being driven south-east on this level. The south-east drift on the 500-ft. level is 400 ft. long and the north-west drift on this level is 300 ft. long. The raise in the south-east level has been stopped at a height of 75 ft. because of the unsatisfactory results obtained, together with poor air. A cross-cut from the 300-ft., or bottom level, of the Revert has entered the vein 60 ft. from the shaft, exposing 28 in. of \$38 ore. A drift has been started east. The shaft of the Victory is 145 ft. deep. The plan of the management to cross-cut at 150 ft. has been changed and it is believed the shaft will be sunk an additional 50 ft. before lateral work is started. Three drifts are being driven on the 400-ft. level of the East Divide, one to prospect the main vein and two to develop a cross-vein opened in the cross-cut from the shaft. The south-east drift, being driven toward the intersection of the veins in which the Hennessy and Alto are sinking, entered a rhyolite dike and has been turned west to follow the vein.

TULE CANYON.—A. I. D'Arcy, consulting engineer for the Tonopah Divide, has taken an option on the Benton-Radford-Smith claims in the Tule canyon placer field and has started development work. Mr. D'Arcy has formed an association of 20 men with a capital of \$40,000 to develop the claims by drift mining. The Goldfield-Tule Canyon Placer Mining Co., owning adjoining claims on the south, will soon start driving from a cross-cut driven to the centre of the canyon on bedrock.

ONTARIO

CASSEL CYANIDE CO. FORM CANADIAN BRANCH.

Official information has just been received that the Cassel Cyanide Co., of Glasgow, Scotland, has, on the recommendation of William Neill, managing-director, decided to incorporate a subsidiary company in Ontario to be called the Cassel Cyanide Co. of Canada. Mr. Neill has just reached Scotland after having completed one of his periodical tours of Canada and Mexico and was so favorably impressed with the splendid mineral resources of Northern Ontario, as well as with the opportunity that exists for industrial development throughout the Dominion, that he most strongly recommended his co-directors

to give this country an especial amount of their business attention. The object of incorporating a subsidiary company in Canada is primarily to bring the parent organization into more direct touch with the requirements of Canadian mining interests, but the further outlook is along the lines of general metallurgical and allied industrial development. Three members of the Glasgow board will be on the directorate of the Canadian company. All are highly successful business men, each being a specialist in the section of the organization to which he has given a life-long study. William Neill, the managing-director of the Glasgow company, will discharge similar duties in Canada and will be more frequently on this side of the Atlantic than formerly. He has been associated with cyaniding since John S. MacArthur, the original managing-director of the Cassel company, invented and developed the cyanide process. Sir George Beilby is the inventor of the process for manufacturing cyanide which the Cassel company adopted 27 years ago. During the War he patriotically devoted much of his energy toward developing methods of extracting oil from coal, so as to render the British navy less dependent on foreign countries for the fuelling of oil-burning high-speed naval vessels. In recognition of his many discoveries and of his scientific attainments he received, two years ago, the honor of knighthood. Sir George has devoted much of his spare time to the study of radium, especially in its metallurgical extraction and in its application to the treatment of diseases. He is president of the British Radium Institute. Sir Edward Allen Brotherton, another director, is a chemical manufacturer and the private owner of many large acid plants in various parts of England. His specialty lies along the lines of saving waste by-products and turning them to profitable account. He has several times been Lord Mayor of Leeds, and, at the commencement of the War, raised and equipped the regiment of which he is honorary Colonel. He was created a baronet slightly more than six months ago. One unique feature in the operating of the parent company as regards gold and silver mining has been the acquiring of interests in properties of potential merit and of helping mines which may be unable to reach the profit-earning basis because they lack a treatment plant. W. E. Simpson, who joined the original Cassel company 24 years ago, has, during the past seven years, attended to this part of the company's affairs from the practical standpoint and has spent much of his time in examining properties and, where necessary, of installing the plants. Canada welcomes the arrival of the organization, and, for many reasons, especially in the interests of its own development, heartily wishes the Cassel Cyanide Co. of Canada, Limited, every success.

ALBERTA

CALGARY.—Considerable alarm has been caused by the announcement that the Bow Island gas-fields are showing signs of exhaustion, and that a quarter of the consumers may have to be cut off from the supply. In the mean-

time the gas company is pushing boring operations in the Barnwell gas-field, in the hope of making a strike, and thus relieving the situation and preventing the use of such drastic measures. But, up to now, only one well has been brought in. The Bow Island gas-field supplies the city of Calgary and a large surrounding district with natural gas, which is used for both lighting and heating.

BRITISH COLUMBIA

GRANBY PRODUCTION.—PETITION FOR RAILROAD TO THE GROUNDHOG COAL AREA.

For the year ended June 30 the Granby Consolidated Mining, Smelting & Power Co. produced 25,000,000 lb. of copper. This is a falling off of 20,000,000 lb., and may be attributed to the gradual closing of the Phoenix mines, the fire in the converter house at Anyox, and the tendency to curtail production owing to the low price of copper after the signing of the armistice. The company has taken an option on the Harrison properties on Chickamin mountain, between Eutsuk and Whitesail lakes. The price is understood to be \$200,000, payable over five years. The Rambler-Cariboo company, of Three Forks, has bought the adjoining claim for \$75,000. The orebody from which the Rambler company took ore to the value of \$2,000,000 runs through the newly acquired area for 1600 ft. The Blue Bird and Rawdon claims on Reco mountain, near Sandon, have been purchased by Clarence Cunningham and Sidney Norman for \$35,000, payable over three years. The Rocher De Boule mine, at Tramville, has closed down. A quantity of milling ore has been developed underground and there is a considerable amount on the dumps, but there is no mill on the property, and only ore from the rich shoots that occur from time to time has been shipped. The developed shoots have been exhausted, hence the closing. The Silver-smith mine, at Sandon, shipped four cars of silver-lead concentrate in June. The orebody is being developed in the upper levels, and is looking remarkably well. The Skeena Mining & Milling Co. has been incorporated with a capital of \$250,000 to take over the Ceronado and Victory properties in the Hazelton district.

PRINCE RUPERT.—A petition is in circulation requesting the Provincial Government to offer substantial inducements for the construction of a railroad connecting the Grand Trunk Pacific with the Groundhog coal areas and for the development of the coal areas. Immediately before the War, the late Lord Rhondda had a plan for this work in hand, which was backed by British capital, but with his death the whole thing collapsed. It is estimated that the road will cost \$15,000,000, and it is suggested that the Government should offer 10,000 acres per mile, together with the right to explore and exploit 250,000 acres of coal areas on the usual conditions laid down by the mining laws of the province. At the present time Prince Rupert people are paying \$16 per ton for coal, which is brought from Vancouver island, and it is with the view of obtaining relief from this burden that the petition is being circulated.

THE MINING SUMMARY

ALASKA

Anchorage.—Tellurides of gold have been discovered in ore from the Gold Cord mine in the Willow Creek district. The species were not identified, but calaverite and nagyagite are indicated. The discovery was made by F. Le Roi Thurmond.—R. I. Sill of Los Angeles is examining the Alaska Free Gold, Gold Cord, and other mines and prospects for Los Angeles people who contemplate extensive investments in the district.—The Le Roi mine has let a contract for the driving of 250 ft. of adit to develop a strong vein outcropping on this property.—A U. S. Geological Survey party—R. M. Overbeck, geologist, J. R. Eakin, topographer, and William Foran, assistant—have gone into the Broad Pass region to finish a reconnaissance begun last year.—Four million dollars has been appropriated by Congress for the Alaskan Engineering Commission for the fiscal year 1919-1920. This is a reduction from twelve million requested. The Commission plans to lay steel to Indian river this season.

ARIZONA

Chloride.—The Diana mine, $1\frac{1}{2}$ miles west of Chloride, has been taken over by a security corporation of Boston. Extensive development has been planned and work is to commence before August 1.

Douglas.—The Calumet & Arizona Copper Co.'s smelter output of blister copper for the month of June amounted to 4,924,000 lb., which was an increase of more than half a million pounds over the May production.

Mayer.—The Big Ledge Development Co. is reported to have taken over the Good Luck group of six claims for a consideration of \$30,000.

Miami.—Thirty-six claims of the North Dominion Copper Mining & Development Co. are advertised to be sold at a sheriff's sale to cover the judgment of \$2405 obtained against the company by W. H. Mercer. Since the signing of the Armistice, the Van Dyke Copper Co. has been preparing to sink a shaft and prove the 40 ft. of high-grade copper ore found in the No. 1 drill-hole at the 1220-ft. level. Sinking started May 12 and is progressing rapidly. The shaft, which is now down 200 ft., is about 800 ft. from present Inspiration Copper Co.'s workings.

Oatman.—The strike recently made at the Tom Reed mine near the Telluride property is said to have opened a new vein. Considerable driving has been done on this vein, proving it to be nine feet wide in places and assaying \$17 in gold.

Patagonia.—A. Hennessy is developing a silver property in Corral canyon. Good bodies of ore have been opened in the Republic No. 1 and 2 and in the Soldiers shaft which is down 40 ft. Preparations are being made for the first car-load shipment.

Phoenix.—The total assessed value of the mining properties of the State of Arizona has been placed at \$463,184,526, of which amount \$417,707,615 represents the valuation placed upon the producing mines. The Inspiration Consolidated Copper Co. leads the list of large producers with a valuation of \$79,900,000. The Phelps Dodge Corporation, Copper Queen Branch, is second with \$72,050,407. Others

in order of importance are: United Verde Copper Co., \$50,-273,766; Ray Consolidated Copper Co., \$48,504,837; United Verde Extension Copper Co., \$42,379,713; Miami Copper Co., \$30,803,654; New Cornelia Copper Co., \$29,555,984; Old Dominion Copper Co., \$15,129,208; Phelps Dodge, Morenci Branch, \$8,414,471; United Eastern Mining Co., \$5,442,065; Magma Copper Co., \$5,168,339; Shattuck Arizona Copper Co., \$4,963,522; Consolidated Arizona Smelting Co., \$4,153,842; Arizona Commercial Mining Co., \$2,493,757; and Tom Reed Gold Mining Co., \$1,412,801.

Prescott.—The Tuscumbia silver mine in the Bradshaw mountains five miles west of Peck is being sampled and examined by engineers representing a large mining syndicate. The Pat Dolan group of two claims has been sold to the Peck Mining Company for \$30,000. Operations on these claims are to be commenced at once. The old workings of the Peck mine are being explored and the new mill is now treating the 30,000 tons of old tailing.

Superior.—Development work has been started on the United Superior Copper Co.'s claims which adjoin the property of the Grand Pacific. E. C. Norris is in charge of the work.

Tucson.—Albert Steinfeld & Co. has brought suit against the Narragansett Mines Co. to recover \$300,000 loaned on notes. The Narragansett mine is one of the oldest producers in the Helvetia mining district. This property has been worked periodically since 1870 and has yielded a large tonnage of high-grade copper ore in the past.

CALIFORNIA

Grass Valley.—Mining conditions are rapidly becoming normal in the Grass Valley district, and the Empire and North Star mills are again operating at capacity. Water, which accumulated during the brief strike of the miners, is being rapidly removed from the deeper workings. The Sultana management is arranging to install new equipment preliminary to unwatering the property and resuming developments.—At the Idaho-Maryland a powerful compressor is being placed in commission and unwatering of the old shaft is about to commence. Several carloads of machinery for the new pumping plant have arrived.—New outcroppings from one of the lodes of the State Highway Mining Co., on the Morandi tract, have been found and disclosed some handsome specimens of ribbon quartz showing gold. The company now has its shaft down 50 ft. and has driven more than 100 ft. in search of the second lode known to exist in that locality. It is expected that this lode will be cut within a short time.

Kennett.—From 1905 to January 1, 1919, the Mammoth smelter at Kennett treated 3,420,410 tons of ore from the mine, according to the report of the advisory committee appointed by the supervisors to determine the assessed value of the company's property. The company was assessed for its mines and improvements almost \$2,000,000 and asked for a heavy reduction. The committee finds that ore-reserves in the Mammoth now total only 115,564 tons, which with 17.9c. copper nets \$3.83 per ton, a total of \$442,610. The committee also found that the smelter can be kept running for a great period only after the company has spent

considerable money on development and on remodeling its reduction plant.

Lewiston.—The work of driving a new adit at the old Fairview mine, ten miles from Minersville, is going ahead satisfactorily to the new owners, a company of business men. Two shifts are working. The adit will tap the old workings at a distance of 800 ft. from the portal. A ten-stamp mill is on the property.

Sierra County.—The U-No and Favorite claims, believed to be an extension of the Tightner vein, were bonded recently to Alfred Van de Zande, Thomas Maher, and L. E. Hendricks, who will commence development immediately.

Weaverville.—The Superior Court has given the administrator of the estates of Henry Jacob and John Jacob, brothers, permission to sell their placer mines, which are on Trinity river across from Junction City, to Jafet Lindenberg, the Alaska mining man, for \$21,000.

IDAHO

Kellogg.—The Caledonia Mining Co. has declared a monthly dividend of \$26,050, according to Stanly A. Easton, president. This is at the rate of a cent a share on the issue of 2,605,000 shares. Payment will be made August 5. The forthcoming payment will increase the total of payments for the year to \$208,400 and the grand total to \$3,881,450. Figures covering the net profits in June have not been compiled, but Mr. Easton estimates them at \$20,000.—Wages of miners in the Coeur d'Alene have been raised to the war scale of \$5.25 per day. All the companies have agreed to the new schedule, which took effect from July 16, the last pay-day.—The installation of milling machinery and the erection of a covering for it is proceeding steadily on the property of the Nabob Consolidated Mining Co. It is believed the work will be completed in August. Stopes have been opened and underground work is proceeding. The plant will have a daily capacity of 150 tons and has been designed to concentrate the ore developed in the Denver claim of the company and in the original Nabob group. Ore has been followed on two levels of the Denver for about 400 ft. on each. The levels are 100 ft. apart and the lower attains a depth of 700 ft. at the face. The ore lies in parallel bodies a few feet apart. It contains an average of about 10% lead and 16% zinc, according to reports made in the period of development, about a year ago.

Mullan.—Operations in the Morning mine of the Federal Mining & Smelting Co. have been interrupted by a flow of gas. Whether the gas comes from an old fire or a new one has not been determined. Men remain in the mine but two hours to a shift to maintain the operation of pumps.—The National Copper Mining Co. earned \$25,000 net in June, according to an official estimate. An improvement in grade has been found in the opening of a stope on the new 800-ft. level.

Salmon City.—Satisfactory progress is being made at the Pope-Shenon mill and mine near Salmon City, according to A. Bolais, superintendent. The forms for the foundation of the new mill are ready for the pouring of cement. The first unit, which will cost approximately \$50,000, will be constructed with funds provided by the floating of a special bond issue. Work at the mine, which was retarded because of a lack of power, will be speeded up materially with the installation of a new gasoline engine, which was recently shipped.

KANSAS

Pittsburg.—All the mines of the Central Coal & Coke Co. in the Kansas field are idle. The strike order issued by President Alexander Howat and the district board of District No. 14, United Mine Workers of America, in conjunction with a similar order issued by the Missouri district

officials, recently went into effect. Not only are all the Central's mines, employing about 1400 men, idle, but several mines owned by the Central and operated by other persons under lease are also affected. The miners allege that they have been unable to settle numerous grievances with the Central in the two States.

MONTANA

Butte.—A decision of more than ordinary interest to the mining men of the Butte district in particular, and also applicable to any other mining district where similar issues are involved, was received from the Interior Department recently by Attorney John A. Shelton, in the case involving the W. E. lode mining claim, lying in the south-eastern part of the Butte district in a valuable section of the copper area. Notwithstanding the fact that patent had been issued for the Emery placer in 1881, and the fact also that the mineral location contesting the placer right to the lode claim was not made until 1908-9, it is held that the placer patent excepted from its provisions any rights as to the lodes known to exist within the ground claimed as placer. The Secretary of the Interior ordered the issuance of patent to the lode claimants for that part of the lode within the area covered by the placer patent. The importance of the decision rests in the fact that the Interior Department will permit the patenting of lode claims within the area of placer patents, already issued, if proof is furnished of the knowledge of the existence of lode-veins on the ground prior to the date of the application for placer patent, it being held that a placer patent will except from its grant any lode-veins so known and proved. The ground covered by the decision of the Reno company contest, while small, covers a valuable portion of the copper territory of the camp, lying in part across the Belmont group of the Anaconda company, and is known to be within the productive copper area.

East Butte produced 1,513,360 lb. of copper and 55,999 oz. of silver in June 1919, compared with 1,416,460 lb. of copper and 19,867 oz. of silver in May.

NEVADA

Carson City.—Governor E. D. Boyle has selected Messrs. Boardman and Jones, professors at the University of Nevada, to make a thorough investigation preliminary to appointment of commissions to establish a State smelter and State cement plant. The commissions are to determine the feasibility of erecting such plants, following the preliminary examination of sites, resources, and other factors. Appointment of the commission was authorized by the last Legislature. The proposed plants are planned to make the State independent of any cement trust and to encourage small mining companies.

Ely.—Diamond-drilling is proving the existence of extensive deposits of ore on the property of the Consolidated Mines Co., according to the report of Robert Linton, managing director: "An inclined diamond-drill hole has been put down on the 1300-ft. level to explore the formation in advance of sinking the shaft and opening up the mine to deeper levels. The drill at a depth of 1550 ft. below the collar passed through 33 ft. of ore, corresponding to a horizontal width of at least 16½ ft. and averaging 8% copper. New ore also has been recently cut on the 1300-ft. level, on the cross-cut farthest east on this level, and near the western end of the workings on the 1100-ft. level. This ore, which assayed 8% over 5 ft., is considerably south of any previously cut on this level. Satisfactory progress is being made on the cross-cut on the 1400-ft. level, which has, however, not yet reached the ore-bearing zone. A station is now being cut on the 1400-ft. level and shaft-sinking will be started as soon as possible. It has been decided to sink the shaft at once an additional 400 ft., which will permit of opening the mine to the 1800-ft. level."

Tonopah.—Except at the Tonopah Divide and a half-score other properties of early-day standing, mining operations at Divide are largely confined to shaft-sinking. It is therefore not to be expected that ore discoveries will be numerous until depth is gained and the veins cross-cut and explored.

—Cross-cutting will soon be started at 100 ft. by the Crown Divide, adjoining the Belcher and Belcher Extension. This cross-cut will be extended under old stopes from which rich ore was shipped by a former management. The Crown is now using air-drills.—The shaft of the Alto Divide is 280 ft. deep and is cutting a different rock, indicating that the ore-bearing formation should be entered at about 300 feet.

Virginia City.—The orebody recently discovered on the Southwest Comstock has widened to five feet of ore, and the vein is increasing in size and richness as developments advance. The Southwest Comstock lies seven miles southwest of Virginia City, and is believed to be on the continuation of the Comstock lode. The Comstock Superior has started work on adjoining ground toward the north-east in expectation of opening ore at shallow depth. The Comstock Eagle Co. has acquired extensive holdings farther north-east and has arranged for aggressive work. Scores of claims have been located in the last month. The trend of the main vein system has been traced into Virginia City, and local men believe from the surface indications that the district is the true extension of the great Comstock lode, which has produced from \$800,000,000 to \$1,000,000,000 in silver and gold.

OKLAHOMA

Commerce.—The Defender Lead & Zinc Co. is preparing for a mill on its lease near the Bluebird between Tar River and Commerce. The company has a shaft in ore and a drift 200 ft. long, with one of the richest dumps in that part of the district. J. H. Wright, president of the company, expects to close a deal for a mill some day this week, and as soon as this is done work on removal will start. By the time the mill is ready it is planned to have the ground thoroughly developed, so that sufficient ore may be had to keep the mill in constant operation. A. G. Hoppock, of Joplin, is vice-president of the company, and H. W. Hess, of Baxter Springs, secretary and treasurer.—H. W. Hess together with nine associates have taken a lease on 40 acres of land formerly held by the Roanoke Mining Co. adjoining the Defender property. The Roanoke company failed to find an orebody, and abandoned the property. Mr. Hess and his associates were encouraged to take over the lease by the showing made by the Defender. They plan to drill eight or ten holes to a depth of 300 feet.

UTAH

The expected increase in wages in many of the districts became effective on July 16.

Notice of an increase of 75c. per day was posted recently at the Park City and Tintic mines. In the future the following scale for the various classes of mine labor will be paid: Machine man, \$5.25; helper, \$5; miner, \$5; mucker, \$4.75; laborer, \$4; timberman, \$5.25; helper, \$5; cage-rider, \$5.25; donkey engineer, \$5; first-motion hoisting engineer, \$5.50; second-motion hoisting engineer, \$5; machinist, \$5. Increases of wages of all men employed at the Bingham mines has been agreed to by the principal mining companies. Notices were posted at the properties of the Utah Copper Company at Bingham and Garfield that the amount of the advance would be announced within a week. Mines agreeing to an increase in the Bingham district include United States Mining Co., Utah Consolidated, Utah Metal & Tunnel, and the Bingham Mines Co. The action taken at Tintic and Park City of increasing wages 75c. per day re-establishes the maximum war-time scale of July 1918,

when operations were curtailed fully 50% in consequence of the destructive slump in metal prices. Operators are said to feel that this increase has been granted in anticipation of improved metal market conditions and in recognition of the fact that the cost of living remains as high as during the War. If the near future expectations with regard to metal prices are not realized it is probable that some properties will suspend operations, inasmuch as many were not meeting operating expenses under the scale prevailing before the present increase. Statistics recently compiled and published show that Utah metal mine dividends in the first half of the year were 43% less than in the corresponding period of last year. State and federal taxes, which are an important item in the operation of the larger properties, are much higher than last year. This consideration alone more than offsets the moderate reductions made in a few lines of mine supplies since the first of the year. Moreover, quotations on all principal Utah metals, with the exception of silver, which is about five points higher, are well below the prices prevailing last July, when the equivalent of the present new scale was established.

Alta.—Developments in the Alta Tunnel are reported to be of a highly interesting character. The big adit is now in 3600 ft., from which point drifts are being driven in different directions to get into the ore-zone. The drift to the south-east has been pushed a distance of 400 ft. Just now there is considerable water coming in, a condition which indicates open country beyond and is regarded as a hopeful sign. The Tunnel workings have a vertical depth of approximately 1600 ft., which is practically 800 ft. below the workings of the Prince of Wales. For nearly 200 ft. the miners have been driving west on a fissure following small stringers of ore which run under the lime. Although company officials claim nothing of a sensational character, they are much encouraged with the outlook and propose to continue the work.

Tintic.—Tintic ore shipments for the past week show an excellent increase. The mines and the number of cars of ore shipped from each follow: Chief Consolidated, 25; Dragon, 19; Tintic Standard, 16; Iron Blossom, 15; Centennial-Eureka, 9; Grand Central, 8; Mammoth, 7; Colorado, 6; Eagle & Blue Bell, 6; Empire Mines, 4; Swansea, 4; Ridge & Valley, 3; Gemini, 2; Bullion Beck, 1; Victoria, 1; Alaska, 1; Showers, 1; George Castleton, 1; total, 129 cars.

WASHINGTON

Republic.—"The Quilp Gold Mining Co. has sunk to 800 ft. in its extension of the Surprise shaft and in the course of this work has removed nothing but ore," said W. W. Gifford, secretary of the Alliance Mining Co. "Ore in a large body has been followed within Quilp ground for 200 ft. on the 800-ft. level. The Surprise shaft is on adjacent property and has reached a point 15 ft. from an end-line of the Quilp. Everything broken in the course of this development has been shipped to the smelter. These disclosures have encouraged the company to unwater and extend the Quilp shaft with a view to connecting with the drift in ore on the 800-ft. level." W. G. C. Lanskill is manager, Alex McKay, superintendent, and S. H. Richardson is the consulting engineer.

Spokane.—Coal of high grade is reported by recent visitors to the Detillion coal mine about 40 miles down the Spokane river from the city of Spokane. The property is owned by B. F. Tilsley, Phil Hoisington, and associates, all of Spokane, and is being developed by Hoisington, Tilsley, W. C. Corbett, and others who were in the inspection party.—The Loon Lake Copper Co., whose property is about 50 miles from Spokane, has had two shifts at work in the mine for a week. The mill is being operated on a two-shift basis or at the rate of 100 tons daily.

CANADA

British Columbia

Grand Forks.—The Grand Forks smelter of the Granby Consolidated Mining, Smelting & Power Co. may be re-opened should be price of copper rise to a point in the neighborhood of 25c. per pound, says a Boston report. Operation of the smelter was suspended recently after a service of two decades or longer.

Trail.—James J. Warren has been made president of the Consolidated Mining & Smelting Co. of Canada. For two years he has been managing director of the company. The offices of the company are to be moved from Toronto to Montreal. The company received 7205 tons of ore in the seven days ending July 17, according to a report from its smelter at Trail, B. C. The figures differ little from those of the last previous week, but are above the average in previous months.

Ontario

Grenfell Township.—A gold discovery of considerable promise has been made on the Four Nations Gold Claim, situated a mile or two north-west from Kenogami station, in the township of Grenfell. The vein in which the gold has been discovered has been traced for about three hundred feet, being found at outcrop on both sides of the Blanch river. Considerable exploration work has been done this year by the owners of the property.

Kirkland Lake.—According to the rate of progress on the construction of the macadam road from Swastika to the centre of activity in the Kirkland Lake district, it appears that the new road will be completed before winter. This road is expected to result in a substantial reduction in the cost of material at the mines, as well as in the town of Kirkland Lake. In connection with the Canadian-Kirkland mine, which is under option to the Crown Reserve Mining Co. of Cobalt, it is learned that the option agreement contains a strike clause which has the effect of suspending the terms of the duration of the strike. Some of the working options held by other companies in the Kirkland Lake area do not contain a strike clause and are consequently inconvenienced by the present labor strike.

Porcupine.—Dome Lake's mining plant, which was damaged by the recent forest fires, will probably be in operation when this goes to press. It was found that the fire did much less damage to the plant than was at first thought. The boilers were not damaged to any extent and some small repairs only were necessary to put the compressor in working order. Two motors, which were burnt out, have been replaced. The greatest loss occurred through the destruction of the buildings.

MEXICO

The U. S. Department of State recently made public portions of the new Mexican mining law that went into effect July 1. The transitory articles provide that all penalties due on mining properties prior to the date of the decree, June 27, 1919, are cancelled, but that taxes on mining claims must be paid during July and August of this year. Provisions are made for the payment in installments of the taxes overdue, but, if the new law is not complied with, the titles to the properties will revert to the State. The new decree also prohibits the export of gold and provides that if bars of mixed minerals which include gold are exported coinable gold must be shipped into the country in quantity equivalent to the gold contained in the mixed bars. The tax rate applied to the mining industry is graduated so that the larger the property the heavier the tax.

KOREA

Ulsan.—The Oriental Consolidated Mining Co. extracted \$84,830 worth of gold in June.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Waldemar Lindgren is here.

L. B. Jarvis has returned from the Malay States.

C. H. Munro is at Ipoh in the Federated Malay States.

C. Colcock Jones, of Los Angeles, was in San Francisco this week.

Edwin Higgins has returned to San Francisco from a visit to Ajo, Arizona.

Henry P. Nagel, Jr., of Denver, has been visiting Tuolumne county mines.

Bennett R. Bates will be in Mexico for several months representing the Dorr Company.

Adolf Knopf, of the U. S. Geological Survey, has been inspecting the Divide district of Nevada.

C. W. Beauchamp, for thirteen months with the Engineer Corps of the A. E. F., has returned to Worden, Illinois.

Donald M. Liddell, Captain in the A. E. F., has resumed his work as chemical engineer at 66 Broadway, New York.

L. F. S. Holland will return to California early in August from Bingham Canyon, Utah, where he is making examinations.

Henry F. Collins is now living in London; he has been elected a member of the Council of the Institution of Mining and Metallurgy.

Ernest Levy has left Rosslund, B. C., to go to Havana, Cuba, to take charge of some properties for Alexander Hill & Stewart, of London.

Lester S. Grant, formerly superintendent of the Jumper mine, in California, has been appointed Professor of Mining in the Colorado School of Mines.

Harry J. Wolf, Professor of Mining in the Colorado School of Mines, has resigned in order to join the editorial staff of the 'Engineering & Mining Journal' at New York.

Sidney R. Stanford sailed on August 1 for Central America, where he will have charge of the mine belonging to the Constancia Consolidated Mines, at Bluefields, Nicaragua.

Charles W. Badgley is now superintendent of the El Paso smelter, succeeding James Heggie, who has become superintendent for the United Verde Extension Copper Co., at Jerome, Arizona.

C. H. Abeling has resigned as mill superintendent of the Quad-Metals mill at Frisco, Utah, to accept the position of construction superintendent for the Vipont Silver Mining Co. near Oakley, Idaho.

Clarence K. Colvin, of Los Angeles, has returned recently from Sonora, Mexico, and visited San Francisco this week, to meet his son, Lieutenant Harold B. Colvin, on his discharge from the A. E. F.

Edgar Rickard, who is now resident in New York, has been appointed acting chairman of the American Relief Administration European Children's Relief until the return of Mr. Hoover, when he will remain a director of this charitable organization.

James S. Colbath, recently from the Philippine Islands, where he was in charge of the property of the Colorado Mining Co. at Aroroy, Masbate, has become general manager for the Dolores-Esperanza Corporation, with offices at 714 Mills Bldg., El Paso, Texas.

THE METAL MARKET

METAL PRICES

San Francisco, July 29

| | |
|--|-------------|
| Aluminum-dust, cents per pound..... | 50-60 |
| Antimony, cents per pound..... | 9.50 |
| Copper, electrolytic, cents per pound..... | 23.50 |
| Lead, pig, cents per pound..... | 6.95-7.25 |
| Platinum, pure, per ounce..... | \$105 |
| Platinum, 10% iridium, per ounce..... | \$121 |
| Quicksilver, per flask of 75 lb..... | \$105 |
| Spelter, cents per pound..... | 9.75 |
| Zinc-dust, cents per pound..... | 11.00-13.50 |

EASTERN METAL MARKET

(By wire from New York)

July 29.—Copper is active and firm. Lead is steady and higher. Spelter is less active but easy.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1918, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 48.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

The month of July will witness an actual reduction in the volume of unsold copper surplus which has been piling up since last November. The principal factor in bringing about this result will have been the sales which started last March and which called for delivery for the most part during July. Nearby positions which were required in the June bookings, aggregating between 150,000,000 and 200,000,000 lb., further strengthened this condition. The sales sheets of the various selling factors have by no means been uniform as to the proportion of surplus each has sold, but today it is understood, every one of them has at least started to deliver more copper than current rate of production. One of the 'big three' has been encroaching for some time on its unsold reserve stock, while another has just started to lighten its load. Calumet & Hecla has disposed of a 40,000,000-lb. surplus which existed at the beginning of the year, while the smaller Lake companies have sold themselves into practically the same position.

All branches of lead consumption have been expanding. Paint manufacturers are heavy buyers of white lead, and plumbing-supply makers are taking large quantities of sheet lead and lead pipe. Broadening of new building construction is a big factor in the lead market. Lead-covered cable is in increasing demand, particularly for export. Sporting ammunition makers are busy and are taking their full quota. Speeding up industry generally is reflected by expanding demand for solder and other white metals containing lead.

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound:

FOREIGN EXCHANGE

Sterling exchange rallied somewhat during the week, although fluctuations continued to be violent. Quotations, however, have not the usual meaning, as frequently the extreme figures named do not result in actual transactions. The continued low rates are serious, not so much for the monetary burden that they impose on European importers of our goods, as in the menace, which is being more clearly recognized, that threatens our exporters in a drastic curtailment of such purchases. The latest remedial suggestion in this connection is for Anglo-American banking co-operation through drawing by British banks of 'finance bills' on accepting American banks, with the expectation that the reserve banks might agree, at least temporarily, to re-discount these bills and thereby relieve the strain. The committee of foreign exchange bankers named to study the situation has held its first session, at which it listened to the views of various export interests. At other sessions the whole subject will be surveyed from different angles before a report or a program is framed to help solve the situation. Meanwhile, sundry rumors continue to circulate as to the prospects for wholesale banking and business co-operation with a view to needed credit extensions to Europe.

Quotations on July 29 are as follows:

| | | |
|-----------|--------|-------|
| Sterling: | Cable | 4.37% |
| | Demand | 4.36% |
| France: | Cable | 7.23 |
| | Demand | 7.24 |
| Lire: | Demand | 8.56 |

Eastern Metal Market

New York, July 23.

All markets are active and higher except the tin market, which continues very quiet.

Demand for copper is still heavy and prices are considerably higher. Copper at 25c. is the prediction for fall.

Demand for tin is light both for spot and future delivery. The lead market is strong and higher.

Buying of zinc continues with higher prices recorded and the metal reported as scarcer.

Antimony is in heavier demand and has advanced in price.

IRON AND STEEL

Threats of a strike in iron and steel plants have caused some talk in the last week but it is not taken very seriously. Judge Gary is quoted this morning as not expecting that the movement to unionize Steel Corporation employees and have them strike will succeed. The present outlook is that if a strike is voted by present union workers, it will not be general or serious. Pig-iron output is increasing each week, five furnaces having been added to the total in the last week in the Chicago and Birmingham districts. Export steel orders for the three weeks of July have not held up to the June rate but a heavy movement is expected the rest of the year. Railroad material is noteworthy in the export trade, France wanting 6000 cars and Cuba 1050; the American Locomotive Co. has taken 23 locomotives for export, 12 of them for Java.

COPPER

The market is very strong with prices advancing almost daily. In the last two weeks electrolytic copper has experienced an increase of about 2.50c. per lb. In the last week the advance has been 1.75c. and it was about the same amount the week previous, one day alone witnessing an advance of about 1c. Consumers are alive to the fact that in proportion to future demand and because of the future labor situation the metal may become scarce and they are endeavoring to cover future needs. While inquiry for last quarter delivery is heavy, few sellers are willing to sell beyond September, or in few favored cases October, for which they ask not less than 24c. Electrolytic copper today is quoted, largely nominal because hard to obtain, at about 23.50c., New York, for July-August delivery. Some sales have been made at this quotation. Lake copper is scarce for July-August delivery and is quoted at 23.75 to 24c. for this position. Demand is heavy for both domestic and foreign consumption. One estimate is to the effect that at the rate of selling up to July 20, total sales for the month will approximate 250,000,000 lb. Demands of the ultimate consumer have caused an increase in orders for manufactured copper. This is true of brass also. The whole situation is very strong. A report is current that negotiations for the sale of a large quantity of copper to Germany are progressing and that they must be concluded in a few days through representatives of German bankers and the Copper Export Association.

TIN

Only one day of real activity in this market was reported in the last week, and this is not absolutely confirmed first hand. It was on July 17, when about 500 tons was sold, mostly for future shipment. The prices said to have been involved were about 50c. for future shipment from the East and 51c. for future shipment from England. Compared with prices only a week ago, these are low, but evidently this was caused by the extreme fall in sterling exchange, and some buyers were attracted. Others were, however, frightened, although why they should be is not clear as in such a case

the exchange rate concerns the seller largely, so far as risk is implied. July 18, there was an auction sale, by Burling & Dole for the Government, of 175 tons of Banca tin at prices ranging from 65.25 to 67.25c. for the various lots. This was metal confiscated some months ago by the Shipping Board during the War. Although its delivery will not be possible for some little time owing to formalities involved, it is already being offered for re-sale at 68c. per lb. around which level American tin, 99%, is selling. Straits tin, spot shipment, from allocated stocks in consumers' hands is nominal at 70c. per lb., New York. Today's quotations for future shipment are as follows: From England, 51c.; July-August from the East, 51.50c.; Straits tin from England, 52.75 cents.

LEAD

The American Smelting & Refining Co. again increased its price last Friday, July 18, to 5.75c., New York, from 5.50c., New York, which prevailed before. Outside sellers at once followed suit although some were reported to have sold up to 5.60 to 5.65c., New York, before this, as noted a week ago. Already this week sales in the outside market are reported as high as 5.90c., New York, but the metal can still be bought at the Trust price. We therefore quote the market at 5.75c., New York, or 5.25c., St. Louis, for early delivery.

ZINC

The market continues to advance and its position is very strong. Increases in prices have appeared daily so that today prime Western for early July-August delivery is quoted at 8.06c., St. Louis, or 8.40c., New York. For September or October delivery, the quotations are from 8.10 to 8.20c., St. Louis. Although demand is not as active as last week, it is still strong and the metal appears to be rather scarce for early delivery, with not much eagerness by sellers to take far future deliveries. Ore prices are also higher in the West, up to \$53 to \$54, and labor is not abundant. Export demand continues good.

ANTIMONY

Demand has increased considerably and prices are higher. Wholesale lots for early delivery are held at 9.25c., New York, duty paid.

ALUMINUM

No change is noted. No. 1 virgin metal, 98 to 99% pure, is quoted at 32 to 33c., New York, duty paid.

ORES

Tungsten: Demand is light and prices are nominal at \$7.25 to \$7.50 per unit for spot Chinese ore, \$10 per unit for Bolivian ores, and \$15 per unit for American high-grade scheelite. There has still been no test of the ferro-tungsten market but it is stated that it could probably be bought for \$1.15 per pound of contained tungsten.

Molybdenum: There is no life to the market and quotations continue nominal at 75c. per pound of MoS₂ in regular concentrates.

Manganese: There have been no developments, quotations for foreign ore being nominal at about 60c. per unit.

Manganese-Iron Alloys: British producers have again lowered their price of standard alloy to \$105, seaboard, but thus far American makers have not met this and are still quoting \$115, delivered. It is believed they would sell at \$110 delivered; if so, they would in most cases have the advantage. Sales for export have been made, and one large consumer in the East has effected a commission arrangement for his ore with an American alloy producer for 5000 tons of standard ferro-manganese.

Company Reports

Calumet & Hecla Mining Co. and subsidiaries:

CALUMET & HECLA

Property: mines, mills, and smelters in the Copper Country of Michigan.

Financial Statement: copper sold at an average of 24.28 cents realized \$19,027,052, and at a cost of 19.79 cents the profit was \$3,519,755. Adding dividends from subsidiaries, \$1,856,941, interest, silver sales, etc., and deducting taxes, etc., the net income for 1918 was \$4,949,196. The balance of current assets was \$12,565,926 at the end of 1918, a gain of \$1,939,441. Liberty Bonds held amount to \$4,402,900.

Dividends: No. 183-186 totaled \$5,500,000, making \$150,-750,000 since the commencement of operations. Dividends received from subsidiaries to date are \$10,968,077.

Development and Mining: on the Conglomerate lode, shaft-pillars and arches were being removed from the workings of 9 shafts, 81 drills breaking 477,541 tons. It was decided to discontinue sinking at Hecla No. 6 and 7 shafts—7875 and 7977 ft. incline deep—also South Hecla No. 9 and 10—6102 and 8133 ft. deep—on account of cost of maintenance; so in order to reach ground lower in this part of the mine, a haulage-level, at the level of No. 80, connecting with the Red Jacket shaft—4900 ft. vertical—is being driven in an amygdaloid lode 180 ft. under the Conglomerate. The length will be 7800 ft., 2826 ft. of which is finished. From the haulage-level, sub-shafts will be sunk for mining the lower part of the Conglomerate. All of the ore will be trammed by power to the Red Jacket shaft. A total of 10,841 ft. of work was done in this section of the mine, against 2942 ft. in 1917, and 5142 ft. in 1916, and 5522 ft. in 1915.

On the Osceola lode new openings covered 10,192 ft., compared with 16,690 ft. in 1917. Fourteen storage-battery locomotives were installed for tramping.

Production: a comparison of the past four years is as under:

| | 1918 | 1917 | 1916 | 1915 |
|-------------------------------|------------|------------|------------|------------|
| Ore treated, tons..... | 2,876,392 | 3,159,570 | 3,166,274 | 3,188,583 |
| Average copper, per cent..... | 1.021 | 1.082 | 1.120 | 1.114 |
| Copper from mine, lb..... | 58,722,969 | 68,419,826 | 71,349,591 | 71,030,518 |

The reclamation plant, a dredge digging tailing from Lake Linden, handled 715,007 tons of 0.868 % copper-bearing material at a cost of 7.2 cents per pound. The re-grinding plants treated this sand and 530,657 tons from the mills at a cost of 4.33 and 6.75 cents, respectively. The ammonia leaching-plant treated 1,005,015 tons of tailing, assaying 0.535 % copper, recovering 8,035,156 lb. at 7.71 cents per pound. The total output last year was 67,968,357 lb., costing 19.79 cents per pound; and \$3.07 per ton of ore, against \$2.52 in 1917, \$2.03 in 1916, and \$1.71 in 1915.

AHMEEK MINING CO.

Financial Statement: earnings in 1918 were \$6,950,161, of which \$3,108,141 was profit. Current assets total \$3,837,365, and liabilities (including \$1,640,000 for Federal tax reserve), \$1,830,457.

Dividends: No. 25-28, of \$2 per share each on 200,000 shares, totaled \$1,600,000, making \$11,250,000 since 1911.

Development and Mining: new work covered 13,085 ft., 3000 ft. less than that in 1917. At No. 1 shaft most of the openings and stopes show ground of average quality. This was so also at No. 2. Two electric pumps—one on No. 11 and one on No. 21 level—replaced 8 air-pumps. In July a fire broke out in No. 3 shaft, resulting in 180 ft. of timber and 200 ft. of concrete sets being destroyed. Additional motor-haulage consisted of 3 storage-battery locomotives at No. 2, 2 at No. 3, and 5 at No. 4 shaft.

Production:

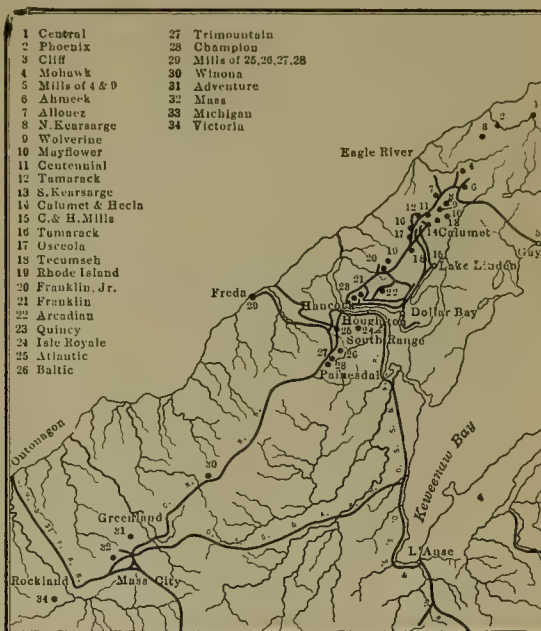

| | 1918 | 1917 | 1916 | 1915 |
|--------------------------|------------|------------|------------|------------|
| Ore treated, tons..... | 1,190,541 | 1,271,275 | 1,164,010 | 948,874 |
| Average, per cent..... | 1.04 | 1.10 | 1.04 | 1.15 |
| Copper produced, lb..... | 24,851,235 | 27,010,812 | 24,142,158 | 21,800,402 |
| Cost per ton of ore.... | \$2.180 | \$1.740 | \$1.400 | \$1.260 |
| Cost per pound of copper | 0.143 | 0.091 | 0.115 | 0.079 |

ALLOUEZ MINING CO.

Financial Statement: of the \$1,779,253 received for copper, \$361,484 was profit. After paying dividends and providing for taxes, a total of \$772,000, the deficit was \$410,-516 for the year. The balance of current assets was thereby reduced from \$1,157,703 to \$892,560.

Dividends: the total of \$600,000 brought the amount since 1915 up to \$2,850,000.

Development and Mining: new work done last year was

MAP OF THE MICHIGAN COPPER COUNTRY

only 80 ft. less than the 2838 ft. in 1917. No. 1 shaft was deepened 191 ft. to 3980 ft., through bad ground. Storage-battery locomotives were installed on No. 19 and 20 levels. On No. 18 of No. 2 shaft, a trolley-type locomotive was put in. New ground opened was generally of average quality.

Production:

| | 1918 | 1917 | 1916 | 1915 |
|-------------------------|-----------|-----------|------------|------------|
| Ore treated, tons..... | 514,888 | 566,674 | 566,960 | 534,705 |
| Average, per cent..... | 0.88 | 0.78 | 0.90 | 0.94 |
| Yield, pounds..... | 7,071,218 | 8,892,915 | 10,219,290 | 10,043,459 |
| Cost per ton of ore.... | \$2.119 | \$1.869 | \$1.589 | \$1.365 |

CENTENNIAL COPPER MINING CO.

Financial Statement: copper sold realized \$553,374, of which \$123,734 was profit. After paying dividends, etc., there was a deficit of \$81,299, and the balance at the end of 1917 of \$436,108 was reduced to \$430,717.

Dividends: two absorbed \$180,000, making \$360,000 since 1916.

Development and Mining: only half of the amount of work done in 1917 was done last year and a third of that in 1916. No. 2 shaft is 4537 ft. deep, and new openings were of slightly lower grade, but stopes were of better quality than in 1917.

Production: 159,040 tons of 0.78 % ore was treated, yielding 2,492,857 lb. of copper, 490,000 lb. more than in

the previous year. Costs were \$2.275 per ton, a decrease of 5.6 cents. At No. 2 mill, the fourth stamp went into commission during October.

ISLE ROYALE COPPER CO.

Financial Statement: 14,764,718 lb. of copper sold at 24.46 cents realized \$3,611,385. Deducting the cost of 16.80 cents, the profit was \$1,130,312. After paying dividends the balance for 1919 was \$1,134,332, against \$890,740 brought forward from 1917.

Dividends: No. 9-13 absorbed \$375,000, making \$1,950,000 since 1913.

Development and Mining: new work amounted to 12,409 ft., compared with 19,271 ft. in 1917, 17,455 ft. in 1916, and 14,446 ft. in 1915. A total of 84 ft. of shaft-sinking was accomplished. No. 2 is the deepest—3650 ft. At the 7 shafts, the openings indicate respectively that 45, 55, 90, 80, 60, and 50 % of the ground will be ore-producing.

Production: the past four years compare:

| | 1918 | 1917 | 1916 | 1915 |
|--------------------------|------------|------------|------------|-----------|
| Ore treated tons..... | 974,508 | 922,160 | 925,419 | 680,270 |
| Copper content, per cent | 0.79 | 0.73 | 0.67 | 0.68 |
| Copper yield, pounds.... | 15,442,508 | 13,480,921 | 12,412,111 | 9,342,106 |
| Cost per ton of ore.... | \$2.14 | \$2.02 | \$1.53 | \$1.45 |

OSCEOLA CONSOLIDATED MINING CO.

Financial Statement: deducting the cost of 17.37 cents per pound from 24.41 cents received for 16,380,996 lb. in 1918 left a profit of \$1,152,686. After paying dividends and reserving \$660,882 for taxes, there was a deficit of \$418,429. The balance of assets, \$2,633,834, at the end of 1917, was \$19,136 greater at the end of 1918.

Dividends: No. 83-93, \$10 per share, totaled \$961,500, bringing the disbursements since 1878 up to \$17,371,775.

Development and Mining: in the Osceola branch was 1219 ft. of work done, and 501 ft. in the North Kearsarge branch. The most active and best part of the Osceola mine was above the 46th level, south of No. 6 shaft. The output of this mine was 30 % greater than in 1917, and costs were 4 cents per ton lower in spite of abnormal conditions. Two trolley-type locomotives are to be installed for tramming. In the North Kearsarge, storage-battery locomotives have been highly successful, and another is being put on No. 18 level. Costs increased from \$1.55 to \$1.69 per ton. In the South Kearsarge the inadequate supply of men caused a decrease of 30 % in output, and costs rose 26 cents per ton.

Production: the three mines yielded the following:

| | 1918 | 1917 | 1916 | 1915 |
|------------------------|------------|------------|------------|------------|
| Ore treated, tons..... | 1,194,967 | 1,237,805 | 1,284,681 | 1,361,089 |
| Copper, per cent..... | 0.66 | 0.65 | 0.76 | 0.72 |
| Yield, pounds..... | 15,919,647 | 16,084,958 | 19,586,501 | 19,731,472 |
| Cost per ton..... | \$1.78 | \$1.63 | \$1.36 | \$1.18 |

SUPERIOR COPPER CO.

Financial Statement: the net operating profit was \$18,700, plus \$33,080 from sundries. Current assets total \$650,398, and liabilities \$27,789. The excess of assets, \$622,609, is an increase of \$133,317.

Development: all the work, 2564 ft., was at No. 1 shaft, on the West lode. This shaft is 3104 ft. deep.

Production: the mill stamped 106,213 tons of 0.78 % ore, yielding 1,676,446 lb. of copper, at a cost of \$2.682 per ton of ore and 23.29 cents per pound of metal. In 1917 the output was 2,201,672 lb., and 3,034,656 lb. in 1916.

WHITE PINE COPPER CO.

Financial Statement: the profit last year on 3,223,377 lb. of copper sold was \$58,743, plus \$66,764 from silver, etc., and less \$30,028 for preferred shares, taxes, etc., leaving \$95,479 net. Current assets total \$522,476, and liabilities \$102,436.

Development and Mining: exploration totaled 3578 ft.,

compared with 3479, 5289, and 8605 ft. in the previous three years. No. 2 shaft was sunk 500 ft. to 1578 ft. This is partly vertical, partly curved, and partly underlay. A new hoist was erected.

Production: a flotation plant was installed at the mill, and is a success; but the loss in tailing is still high when compared with the mines in the Houghton district. There was treated 194,568 tons of 0.84 % ore, against 212,889 tons and 0.95 % in 1917. The output was 3,273,680 lb., a decrease of 793,849 lb. Costs rose to \$2.984 from \$2.365 per ton.

BUTTE & SUPERIOR MINING CO.

Property: zinc-silver mines and mill at Butte, Montana.

Operating Officials: J. L. Bruce, general manager; Charles Bocking, assistant; Angus McLeod, mine superintendent; E. V. Daveler, mill superintendent; O. J. Zook, chief mechanic.

Financial Statement: the past two years compare as under:

| | 1918 | 1917 |
|---|-------------|-------------|
| Revenue from spelter, silver, etc..... | \$6,822,863 | \$7,817,674 |
| Less freight | 1,007,559 | 1,101,237 |
| Less operations at mine..... | 5,263,320 | 4,595,501 |
| Operating profit | \$651,925 | \$2,120,936 |
| Profit (plus other income, minus taxes) | 628,348 | 1,987,480 |
| Surplus at end of 1917..... | 5,070,306 | |
| Surplus at end of 1918..... | \$5,698,654 | |
| Net current and working assets | \$3,884,570 | \$2,901,671 |

Dividends: none were paid, in view of pending litigation and general conditions, so the total remains at \$16,940,000. In the Elm Orlu apex suit, the Butte & Superior lost, and has to pay \$177,707, plus interest. In the Minerals Separation flotation suit, the decision was against Butte & Superior, as discussed in the issue of June 21.

Development and Mining: extensions during the year totaled 33,459 ft., also 3772 ft. of diamond-drilling. The accident and repairs to No. 1 shaft reduced greatly the operation of this outlet from May to November. No. 2 shaft was completed to a depth of 1900 ft., stations completed, concrete put in where necessary, and an electric quintuplex pump installed. No. 3 shaft was completed to 2103 ft., and was the outlet for 85 % of the year's production. Stopping operations on the Deadwood vein, to the north of the Rainbow lode, give expectations of ore-shoots in the north-west veins. There are also large orebodies at the extreme eastern end of the mine beyond the east end-line of the Black Rock claim, as proved by exploration on the 1600 and 1700-ft. levels under the Four Johns and Raymond claims. Owing to the extra amount of work necessitated by the apex suit, reserves show a decrease of 229,200 tons to a total of 830,000 tons. This ore averages 17 % zinc and 5.7 oz. of silver per ton. The direct cost of mining was \$7.19 per ton, an increase of \$2.04.

Milling and Production: improvements to the mill were nominal, being only minor alterations in the flow-sheet. The new coarse-crushing plant, at No. 3 shaft, was started in May. The fine-crushing department now consists of three sets of 54 by 20-in. Garfield rolls and one 8 by 6-ft. ball-mill. The grade of concentrate was raised by 3.74 % in zinc and 2.23 oz. in silver, and recovery increased by 1.84 %, due to the improvements. The mill treated 468,814 tons of ore assaying 15.928 % zinc and 6.335 oz. silver, 92.965 % of the zinc being recovered. The concentrate—135,543 tons—averaged 51.217 % zinc and 20.029 oz. silver. Lead concentrate—2790 tons—carried 39.557 % lead, 23.858 oz. silver, and 12.2 % zinc. All concentrates and residues were sold, and contained 4702 oz. of gold, 2,781,394 oz. of silver, 139,522,506 lb. of zinc, 11,956,951 lb. of lead, and 1,293,313 lb. of copper.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

AUTOMATIC ORE UNLOADER

The automatic unloader shown in the illustrations is unusual in design, and has proved through many years of service to be one of the most successful devices for unloading cargoes of ore from Lake steamers that has ever been devised. Although of immense proportions, the design has been simplified and the control perfected to such a point that the Wellman-Seaver-Morgan Co. considers the machine to be the last word in delicate control and operation.

The unloader consists of a main framework mounted on trucks, which travel along the runway rails placed approximately as shown in the photograph. The main framework extends back to the rear runway over a temporary storage-pile, where the ore can be discharged if desired. Between the front and rear runways, space is provided for railroad tracks, where ore-cars are placed under the machines and loaded for transportation to blast-furnace plants. The girders of the main framework form a support for runway rails, on which a trolley travels. This trolley supports a balanced walking-beam, from the outer end of which a stiff bucket-leg depends. At the lower end of this leg is the bucket, which is operated by machinery on the walking-beam. All horizontal movements of the bucket are accomplished by means of moving the trolley backward and forward on the girders. The vertical movements of the bucket are accomplished by the operation of the walking-beam. The forward portion of the beam being out of balance, the bucket descends by gravity as soon as the brakes of the hoisting mechanism are released. The hoisting mechanism controlling this operation is in the enclosed house at the rear end of the walking-beam. Ropes

from the winding drums of this mechanism pass around sheaves at the rear end of the trolley, and are anchored to the rear end of the walking-beam.

In addition to the main parts of the machine described, there is also a receiving hopper at the forward end of the main framework, between the main girders, provided for the purpose of receiving ore discharged from the bucket. The capacity of this hopper is three full bucket-loads; its purpose is to act as a balancing point for the ore between the bucket and the cars, or storage, as the case may be. The bottom of the hopper is provided with outlet-gates, and the contents are discharged as required into a larry, which runs on an auxiliary track suspended from the under-side of the main girders. The larry, after receiving its load from the main hopper, moves to a point so that its contents can be discharged either into the cars standing on the railroad tracks beneath the main span of the girders, or into a temporary storage-pile under the cantilever at the rear of the machines. The ore so placed in this temporary stock-pile cannot be reclaimed by means of these machines, as their function is solely one of unloading the cargo from the ships.

Machines of this type have been made in two sizes, the smaller size having a capacity of 10 tons, and the larger (such as is shown in the photograph) having a capacity of 17 tons in the bucket-shells. The machine shown here is electrically operated throughout, and its speeds are regulated so as to operate through a complete cycle in 50 seconds. Some idea of the capacities of unloading by this method may be derived from a record that was made in Ashtabula by 8 machines of this type having a capacity of 15 tons each, un-

Docks of the U. S. Steel Corporation at Conneaut, Ohio. Seven W.-S.-M. Unloaders Are at Work.

loading 7 boats having a total capacity of 70,000 tons in 22 hours actual time. At other points, four machines working in boats having capacities up to 13,000 tons have unloaded these cargoes in 3 hours and 25 minutes.

The operation of the machine is as follows:

After the boat has been placed along side of the dock, the machine is moved opposite one of the hatches, and the bucket is lowered through the hatch into the ore. After filling the bucket, the walking-beam hoist mechanism is put in operation and the bucket hoisted out of the boat. At the same time, the trolley is traveled back so that the bucket is brought over the main hopper between the girders in the main framework, and its contents are discharged into this hopper. The bucket is then immediately returned to the boat for another load. The ore in the main hopper is discharged into the larry, which has been brought to a point directly underneath the discharge-gates of the hopper. The

formed to the shape as shown in the illustration. These shells are usually provided with manganese-steel cutting-lips, which are necessary to resist the abrasive action of the ore. The shells themselves are carried on heavy cast-steel arms mounted on rollers traveling in guides in the fixed portion of the lower end of the bucket-leg. The position of the operator who controls the operation of the bucket, etc., as previously described, is also shown in this picture. The view shows the bucket in operation in the hold of the modern ore carrier after most of the ore has been removed, and the remainder of the ore has been scraped into position so as to be cleaned up by the bucket.

The motor for operating and closing of the bucket is in the machinery-house at the back of the walking-beam. Ropes from this bucket-closing mechanism are carried through the walking-beam and the bucket-leg, and attached to a power-drum in the bucket-leg directly over the operator.

Unloader Leg and Bucket at Work in the Hold of a Modern Boat. The Leg is so Mounted in the Walking-Beam that it Can Rotate in a Circle, Allowing the Bucket to Reach Out in All Directions. These Machines Have Often Unloaded 97% of a Cargo Without the Help of Shovelers. The Position of the Operator Who Controls the Movements of the Bucket is Shown. The Distance from Point to Point of the Bucket-Shell When Open is 21 Feet.

larry-hopper is filled, and the larry is moved over the desired discharge-point, and the gates of the larry-hopper are opened discharging the ore as required. The larry-hopper is provided with scales so that the contents are accurately weighed and recorded. In this way, a car can be loaded to its allowable capacity, and an accurate record kept of the amount of ore so discharged into the car, thus eliminating the necessity for the use of track-scales. If railroad cars are not available for immediate shipment, the larry is traveled to a position on the rear cantilever, and its contents discharged into a temporary storage-pile, from which it is usually reclaimed for shipment or storage by means of a bridge on the runway at the rear of the unloader.

Only two operators are required for the entire operation of one of these machines. One of the operators, whose station is in the bucket-leg directly over the bucket-shells, controls all of the motions of raising and lowering the bucket, of traveling the trolley back and forth, and moving the machine along the dock from one hatch to another. The other operator is stationed in a cab on the larry, and from this he controls the movement of the larry, the operation of the larry-gates, and weighing of the ore.

The bucket-shells are each made of a single piece of plate

This power-drum is geared to the closing-chain drums, one of which is shown. The bucket is closed by rotating the drums in the proper direction; and it is opened by reversing the motor and the bucket-shells are forced open by means of an opening chain in the centre of the bucket-leg between the two closing-chains.

In addition to the vertical movement, which is given to the bucket-leg by means of the walking-beam, it also has a motion of rotation around its vertical axis. This is accomplished by means of ropes attached to a segment on the bucket-leg itself, the ropes being carried back in the walking-beam to a rotating mechanism which is fixed adjacent to the bucket-closing mechanism. The bucket-leg itself is carried on a roller-bearing attached to the top end of the leg. This motion is introduced for the purpose of turning the bucket at right angles to the hatchway, in order to secure as great a reach lengthwise of the boat as possible; thus the bucket is enabled to reach out under the hatches and remove ore which is not directly beneath the hatch opening. The distance from point to point of the bucket-shells when open is approximately 21 feet.

The scale-larry, into which the main hopper discharges, has a capacity of between 35 and 45 tons, and two larry-

loads are intended to constitute a full carload of ore. The arrangement of the discharge-gates of the larry is shown. They are suspended from the sides of the larry-frame and operated by connecting rods which attach to cranks, also connected to the main larry-frame, these gates being operated by means of a small motor which is carried at the rear of the larry. The gates are so arranged that all or a portion of the contents of the larry may be discharged. The hopper of the larry is suspended in the larry-frame on scales, so that the contents of the larry may be wholly or partly discharged and be accurately recorded.

The mechanism for moving the larry back and forth on its track is also on the larry, and consists of winding drums upon which ropes are wound, the end of the rope being attached to the rear end of the cantilever on the main framework. The larry-track is inclined, and the larry is pulled up the incline by means of these ropes and descends by gravity.

As previously stated, these machines are usually electrically operated throughout. In some cases, however, machines of the same general type have been made to operate by steam and hydraulic cylinders, water being supplied to the operating cylinders by means of a steam accumulator, which furnishes water at a pressure of 1000 lb. per sq. in. The electrically-operated machines are usually designed for a 220-volt direct current; alternating current is never used. The motors required for one of these machines are as follows:

| Operation | Motor | Horse-power |
|---------------------------|-------|-------------|
| Beam hoist | 1 | 275 |
| Bucket closing | 1 | 120 |
| Bucket rotating | 1 | 25 |
| Trolley travel | 1 | 120 |
| Hopper gates | 1 | 100 |
| Longitudinal travel | 1 | 100 |
| Larry travel | 1 | 150 |
| Larry gates | 1 | 40 |

The control for these motors is of the magnetic-switch type throughout, having master controllers in the operators' cabs in the bucket-leg and on the larry. Electric current is supplied to these machines by means of insulated conductor rails running the length of the main runways. The current is collected from these rails by means of pick-up shoes, and distributed to the various portions of the machine. A similar collecting device is also employed for supplying the main current to the trolley. Conductor rails are attached to the main framework of the machine, and the current collected from these rails by means of pick-up shoes attached to the trolley.

Many points of superiority claimed for the 'Wellman-Seaver-Morgan ore unloader, which are not found in other systems of unloading are: (1) The design is very heavy; there is little to get out of order, resulting in low maintenance cost per ton of material handled. (2) The control is accurate and positive, and manual labor is reduced to a minimum. (3) The bucket is positively guided in passing through the hatches of ships, thus eliminating the danger of damage either to the boat or to the machines, arising from the use of rope-suspended buckets. (4) The operator travels with the bucket into the boat, and can always see exactly what he is doing. (5) The bucket is of extremely large capacity, but is so suspended from the walking-beam that the weight resting on the tank top of a boat is less than one-third of the weight of a rope-suspended bucket of equal capacity; in fact, it is impracticable to use a rope-operated bucket of anything like the size attained on these unloaders. (6) One particularly important point to be considered is the extremely low cost obtainable with these machines. Records extending over long periods show an unloading cost ranging from $2\frac{1}{2}$ to $4\frac{1}{2}$ cents per ton, which includes superintendence, labor, repairs, and materials on the machines, as well as the cost for power and light. (7) On account of the high capac-

ity of these machines, the number of units required is less by a considerable margin than of a smaller type lighter machine, which results immediately in a decreased cost of operation, for the reason that a fewer number of skilled operators is required. (8) Again, on account of the extreme reach of the bucket, it is possible for the machine to discharge a very much higher proportion of a ship's cargo than can be accomplished by ordinary rope-operated buckets. The bucket can be rotated at right angles to the hatch and reach out for ore which would be entirely inaccessible to an ordinary bucket. (9) It can be shown conclusively in plants where large quantities are to be handled that there is a distinct saving in first cost, as well as a yearly saving in the cost of operation, over any other type of machine. And (10) This unloader is not a combined machine. It is an unloader—pure and simple—and it does its work well.

COMMERCIAL PARAGRAPHS

The Terry Mining & Metallurgical Corporation of Salt Lake City, Utah, has licensed the Tomboy Gold Mines, Ltd., of Colorado, to use the Terry Differential Flotation Process in its new 500-ton mill now under construction. In this process differential flotation is effected by the use of ammoniacal frothing agents whereby a high-grade lead, silver, gold, and copper concentrate is made in the first cells, followed by the flotation of zinc. Pyrite is subsequently recovered by tabling the flotation tailings.

The Chicago Pneumatic Tool Co. announces the appointment of L. C. Sprague, formerly district manager of sales at New York, as manager of Western railroad sales with headquarters at Fisher Bldg., Chicago, and H. C. Barbee as manager of Eastern railroad sales with headquarters at 52 Vanderbilt Ave., New York. Nelson B. Gatch, formerly district manager of sales at Chicago, has been appointed district manager of sales at New York, succeeding Mr. Sprague. Announcement of Mr. Gatch's successor at Chicago will be made later.

The Mine Equipment & Supply Co. has been organized at Denver, Colorado, with D. H. Fairchild, general manager; John Saunders, superintendent; Tappan Fox, sales manager; Leverette Davis, consulting engineer; and F. M. Dillon, manager industrial department. The company announces plans for the construction of a forge shop for the manufacture of ball-mill balls, the manufacture of Fairchild twin-discharge ball-mill, Empire concentrating table, Fairchild vertical ore-dryer, and Fairchild magnetic separator. In addition to these specialties, a general sales and jobbing business in mining and milling supplies and equipment will be conducted.

At the annual meeting of the Denver Engineering Works Co. the following officers were elected: Frank E. Shepard, president; William W. Torrence, general manager; Edwin S. Kassler, Jr., vice-president and treasurer. Alf. Tellam will continue as metallurgical engineer, Frank A. Lockwood as hoist engineer, and William A. Leddell as sales engineer. Joseph P. Ruth, Jr., inventor of the Ruth flotation machine, has been retained as flotation specialist. The interest in the company formerly owned by the Hardinge Conical Mill Co. has recently been purchased by the present officers and engineers. The Denver Engineering Works Co. will continue to make its line of Dewco mining, milling, and smelting machinery.

The General Naval Stores Co., 90 West St., New York, has issued an attractive pamphlet dealing with its flotation oils. All of the flotation oils manufactured by this company are described with respect to their physical and chemical characteristics and application to various ores. According to the General Naval Stores Co., practically all oils used in the flotation process at the present time fall under the following general classes: pine products produced by both steam and destructive distillation of southern pine wood

(*Pinus Palastrus*); creosotes from northern hardwoods; coal tar and coal-tar oils. In the steam distillation process the resinous material is removed from the pine wood with steam and solvents. The structure of the wood remains practically unchanged. Aside from pine oil, resin and turpentine, more commonly known products, are obtained by this process. Careful manipulation and technical skill of a high order are required in producing a commercial turpentine with a pleasant odor, one that compares with the pure gum spirits of turpentine extracted from the live pine tree. Only old stump wood is used in the manufacture of all its pine products. With time the resinous material in the old

tion properties of oils obtainable by this process. In general these destructively distilled oils are more acid in their reactions.

MILES OF RUBBER BELTING

A single order of belting containing 44,254 ft.—approximately 8½ miles—was shipped recently by the B. F. Goodrich Rubber Co., Akron, Ohio, for the Pennsylvania Railroad Co.'s new grain elevator at Canton, near Baltimore, Maryland. The shipment, valued at more than \$125,000, is probably the largest single order of rubber belting ever completed in the world. Seven box-cars were required to trans-

Tractor-Truck Train Loaded with 8½ Miles of Rubber Belting.

stump changes. No pine oil, only resin and turpentine, is secured from the sap taken from the live pine trees. If comparatively fresh cut or green wood were used, the pine oil secured would be light in gravity and would not contain enough of certain component oils to make a satisfactory and economical medium. In the destructive distillation process the old pine wood is reduced to charcoal in modern steel retorts. The vapors and tars carried over are collected into a crude. Owing to the higher heats prevailing in this process and the complete reduction of the wood, the crude obtained carries a greater variety of compounds than is found in the steam distillation crude. It contains no less than fifty-four definite chemical compounds. Some of these rare compounds are extracted for use in the manufacturing industries. Consequently at the plant using this destructive distillation process this crude has been subject to close study chemically. For flotation purposes the crude is turned into products that embody most effectively the distinctive flota-

port the 131 tons of conveyor and elevator belt, which comprises complete grain handling equipment of this mammoth terminal grain elevator.

This belting will handle, store, and tranship Western grain reaching the coast over the Pennsylvania lines—the elevator being specially designed for loading vessels for export and coast-wise trade. It is interesting to note that this belting equipment will make possible the handling of approximately 2,000,000 bushels of grain daily. The rubber belting as packed for shipment shown in the photograph is of two types—elevator and conveyor. The former belts are 32 and 38 in. wide, while the latter are 36, 42, and 48 in. wide. The capacity of one of the 48-in. horizontal carrier belts is 350,000 bushels in a 10-hour day.

The elevator was designed and constructed by the James Stewart Co., of Chicago, who are among the world's foremost grain elevator engineers, and the structure represents the last word in this type of engineering.

400 tons per mill per day at Kennecott—

And every mill reducing a hard ore to 40-mesh, operating in closed circuit with classifier. This is the record of four No. 86 Marcy Ball Mills at the Kennecott Copper Company.

MARCY BALL MILL

is invariably sold on a basis of lowest cost per ton output. In the above instance the ball load is 13 to 13½ tons, HP. input is 215, ball-consumption is 1.53 lb. per ton.

The reason for Marcy efficiency is graphically shown below. Notice that the grate-openings run with the movement of the mill thereby aiding discharge instead of retarding it. In the Marcy, material is discharged as soon as it is sufficiently fine.

There are many other Marcy reasons such as low pulp-line, low power consumption, ease of operation and rapid circulation.

The Mine & Smelter Supply Co.

DENVER

EL PASO

SALT LAKE CITY

New York Office: 42 Broadway

You ought to have this free book on ball milling practice

Not only does it give instances of the most efficient practice but it also explains how the Marcy can take crusher-product and, in "One Easy Step," reduce it to flotation feed.

It shows why the balls in a Marcy are always crushing ore, their impact being unretarded by any superfluous cushion of water necessary in mills which must carry a high pulp-line.

JUST WRITE FOR THIS BOOK. IT WILL BE SENT UPON REQUEST WITHOUT OBLIGATION.

Massco Service the World Over.

WE are amused to note that such an eminently serious periodical as 'The Annalist' should publish an article on the goldfields of Dutch Guiana, with a cordial invitation, on the part of Mr. J. Barkley Percival, to American capitalists, urging them to engage in the exploitation of these goldfields. The article and the invitation have been sent so often from Paramaribo that they ought to be stereotyped just to save time and trouble. Dutch Guiana is good neither for the health nor the purse of the American miner.

J. E. SPURR has been appointed editor of the 'Engineering & Mining Journal' by the McGraw-Hill Publishing Co., which controls the 'Journal' together with nine other publications. Mr. Spurr has achieved enviable distinction as a geologist, for it is a fact, we believe, that no scientific man on the staff of the U. S. Geological Survey has been more successful in analyzing structural conditions with a view to the direct application of such information to the finding of ore. Tonopah and Spurr will always be joined in honorable tradition.

PRODUCERS of copper are to be congratulated on the fortunate shift in market conditions during recent weeks. Business for September has been booked at 24 cents per pound and there is good reason to anticipate a further considerable advance in the price before the end of the year. The surplus of metal is melting before the warmth of increased consumption. European buying is not yet organized and resumption of business with Germany is still subject to restrictions of one kind or another, but the prospects of a large demand from the war-depleted countries is excellent.

SINCE the resignation of Porfirio Diaz, on May 25, 1911, no less than 217 American citizens have been killed in Mexico, according to a statement made by Secretary Lansing. On another page, in our Mining Review, we give the details of the killing of Theodore Patterson, the superintendent of the Mazapil copper mines. He was not an American citizen, but the vivid story of his death at the hands of a Mexican mob is timely. It will remind our readers of the Santa Ysabel massacre on January 9, 1916, when 18 members of the staff of an American mining company were done to death horribly by bandits calling themselves Villistas. We note also the statement made by Capt. John Barneson, on his return from Mexico, that "Americans are the only foreigners

doing business in the Tampico oilfields whose lives are not respected. No protection is furnished them and no redress is obtained in the event of their being foully murdered." Capt. Barneson is not the kind of man to talk wildly, so we take his report at its face value.

THE first fruits of prohibition in California are good.

In July the number of arrests was 50% below those made in the corresponding month of last year. In San Francisco 1820 arrests were made during July as against 3844 a year ago. The arrests for intoxication were only one-sixth, and of those a large proportion must have been a sequel to the celebrating of John Barleycorn's demise on June 30. For vagrancy in July 1918 there were 1815 arrests, whereas in July 1919 there were only 266. These figures were given an inconspicuous place in our daily newspapers, but they are highly interesting.

IN Mr. McDonald's comment on a statement made by Mr. Hugh F. K. Picard, in his presidential address, he refers to this paper as "a technical periodical," using the word 'technical' in a precise sense. We demur to that, in a friendly way, because the 'Mining and Scientific Press' aims to be more than a record of, or even a forum for, technology; it aims to express the living thought of technical men far outside the mine and mill, the laboratory and smelter. For instance, we publish a most interesting letter from Mr. George Collins on 'Botulism'. That looks recondite, but as a matter of fact it deals with the life and health of men at the mines and it does this in a practical way, that is, in a way likely to promote good health. Again, the letter by Mr. Campbell on the 'English-Speaking Peoples', all the more interesting on account of its opposition to the editor, deals with a subject at least as important as flotation or cyanidation. We recognize that the mining engineer, the metallurgist, and the geologist, together with their comrades in other branches of technical activity, are not merely technicians but thoughtful men and good citizens, to whom all that concerns the daily life of those engaged in the mining industry is interesting. "Man does not live by bread alone."

THE heckling to which Mr. Henry Ford was recently subjected by the lawyers of the 'Chicago Tribune' was, we suppose, to be expected. In a suit for libel it is necessary for the defendant's lawyers to make the most of their case, and to that end unpleasant cross-examinations

are the rule rather than the exception. Yet we must confess but scant sympathy for the press accounts of the episode. With few exceptions the tendency, both in the news columns and editorially, has been to ridicule Mr. Ford from every angle, giving much the same impression as a crowd of small boys that are tormenting a bigger and more able member of their circle who has not a limber enough tongue to defend himself readily. With many of Mr. Ford's actions we do not agree; much he says leaves us cold; but an intelligent person can hardly deny, even if Mr. Ford's method of talking about them has not always been happy, that his achievements in the world of invention and manufacture, as well as the largeness of his vision in business affairs have stamped him as unique in this generation, and we submit that he has deserved better treatment than the press has in general accorded him. This spirit of ridicule has not been manifest only at the recent trial; it has been in evidence ever since Mr. Ford became prominent enough to invite criticism, until he was stung into defending himself by the only honorable means he could command. We wonder how many of the people who smiled as they read his answers to the questions could have done better in that quiet hour in which they read their daily newspaper, without consideration of the embarrassment and mental confusion that accompanies a sharp cross-examination. Even his statement that he could "hire somebody to tell him those things" is exactly in accord with the policy pursued by capable organizers and executives the world over, although again we note an infelicity of expression that perhaps has been the cause for much of the laughter at his expense. We like to think that the national sense of the ridiculous, although not above being petty, is not mean or deep-seated; that the recent deluge of ridicule was merely another evidence of the constant search for something to laugh at; and that beneath the smiles at his eccentricities there is throughout the country a real appreciation of Henry Ford and his works.

A FOOLISH newspaper called the 'Chronicle' gives prominence to an article, by a scribbler named Karl H. von Wiegand, in which General Friedrich von Bernhardi predicts war between the United States and England. Herr von Wiegand is a 'special correspondent' with extraordinary understanding of German psychology, we presume, but he imposes on the credulity of the rest of us by bowing humbly before the vaticinations of such an exploded authority as the author of 'Germany and the Next War'. It is an impertinence to the readers of this San Francisco paper to print such stuff and from such a source. It was Bernhardi who preached the doctrine which the Germans put to the test, so disastrously for themselves and for the world at large, just five years ago. He preached that war is "an indispensable factor of culture," and "a biological necessity"; he denied international law and insisted that "no power exists which can judge between States"; to him "might is at once the supreme right"; he rhapsodised on the "ennobling effect of war"; he ridiculed the idea of a weak nation

having "the same right to live as the powerful and vigorous nation"; he asserted that "the whole realm of human knowledge was concentrated in the German brain," and complacently assumed that "no other people could follow the bold flights of German genius or soar aloft to the freedom of our world citizenship." He said that "England committed the unpardonable blunder of not supporting the Southern States in the American War of Secession"; he insisted that "English imperialism has failed to link the vast empire together, either for purposes of commerce or defence." Tell that on Vimy ridge and on the heights of Gallipoli! He anticipated "a great English colonial war" and he expressed the opinion that "France must be so completely crushed that she can never again come across our path." Ask the Crown Prince how he fared at Verdun! The British "have at their disposal a militia" but, he added, "they can be completely ignored so far as concerns any European theatre of war." Shades of the gallant dead, rob him of sleep until he dies! Of the regular army, he said that "its military value cannot be ranked very highly." "It is very questionable whether the English army is capable of effectively acting on the offensive against continental European troops." Ask Von Kluck and the exiled Kaiser what they think now of the 'old contemptibles'! We forbear to quote more than one other of this prophet's sayings: "Every appeal to force finds a loud response in the hearts of all" Germans. It did; it still does; but it finds small response in the hearts of Americans or Britons, both of whom are sickened by the horrors inseparable from the use of force on an unlimited scale. To us another pentecost of calamity is unthinkable. We shall do our best to prevent it. As for war between England and America, let the poor fool that wrote 'Germany and the Next War' murmur his jaundiced anticipations; we can judge him by his last effort in that direction. It may please the German propagandist to foretell conflict between the English-speaking peoples, because the wish is father to the thought, but it is putrid journalism on the part of a paper calling itself "100% American" to publish such an article from Mr. Karl von Wiegand at Hirschberg, in Silesia.

American Potash

In this issue Mr. Herbert H. Roe presents an interesting account of the various sources from which potash is derived in the United States. He gives prominence to the deposit in Searles lake, California, because it is one of the most important and it is one with which he is personally familiar. Searles lake is estimated to contain ten million tons of potassium-oxide, and the annual drainage of further natural salts into the valley will yield more, making a supply sufficient to meet American consumption for a couple of centuries, if only it is exploited at a cost low enough to overcome foreign competition. This estimate was given by Dr. H. W. Morse in a recent address before the local section of the American Chemical Society in San Francisco. He insisted, however, that the Trona

Corporation must discard its mechanical evaporating plant in favor of the solar method, such as is used in making common salt. He stated that the brine pumped from Searles lake contains 4.8% potassium chloride, whereas the crude rock mined at great depth at Stassfurt, in Germany, carries 14%. The process now applied to the Californian deposit involves the use of an enormous plant, including single pumps lifting 500 gallons per minute, a pair of storage-tanks each of 300,000 gallons capacity, evaporating-pans 85 feet high, 54-inch vacuum pumps, and the cooling of 5000 gallons of liquor from 90° down to 20°C. in 15 minutes. In 1918 the output was 24,000 tons of salts, but this is to be increased, by adding more apparatus, to 4000 tons per month. On the other hand, the Stassfurt rock has to be crushed, sorted, the salts dissolved out and crystallized, thus making an expensive process. It is claimed that by the use of shallow cemented dams and the aid of the hot sun and dry air at Searles lake, a crystalline concentration containing 14% potassium chloride can be obtained. It is the first step in concentration, raising the potash contents of the brine from 4.8 to 14%, that is so costly; therefore the simpler solar method should prove advantageous. It is fair to add that Searles lake, like mines of which we know, has been the scene of 'a battle of the processes', for the experts seem to have held remarkably discordant views and the consummation of the enterprise has been much retarded thereby, not to mention the litigation over the property itself, as mentioned by Mr. Roe. One purpose of his article is to emphasize the need for protecting the potash industry until such time as it will be able to withstand foreign competition, mainly that of the Stassfurt mines, which are in the hands of the well known Kali Syndicate. It was announced at Washington on August 2 that "German agents are largely responsible for the efforts being made to have the embargo on potash importations lifted." To this was added the hope that "the Department of State might be able to shut out the German product until the American industry, built up during the War, was in a better position to meet foreign competition." One would suppose that the Department of Commerce would have this matter in hand, but they do things in their own way at Washington and we shall not mind which official does it so long as it is done. It is significant that on the same day, August 2, the House of Representatives passed the first protective tariff measure to be acted upon since the Republicans regained control of Congress. The measure in question was one levying high duties on chemical glassware and apparatus; it now goes to the Senate, and it must receive the approval of the chief of the Democratic party. It remains to be seen whether he will exercise his veto as President. To those of us outside partisan politics it appears desirable to assist the development of our domestic mineral resources if it can be done for the eventual benefit of the nation. We are informed that as soon as the Armistice was signed the agents of the German potash companies became active in their efforts to procure permission to invade the American market, and they are supported in

these efforts by the manufacturers of fertilizers, to whom a cheap supply of potash salts is desirable. Evidently a clash of interests exists as between the makers of fertilizers and the producers of potash in this country. The State Department, it is reported, "is endeavoring to compromise the situation by proposing that the fertilizer manufacturers use certain proportions of American potash in their manufactures, importing the remainder from either France or Germany." It must be remembered that France, by acquiring Alsace, is now the possessor of important sources of this industrial chemical. The suggested compromise is in accord with Secretary Lane's bill, which failed of consideration in the last session of Congress, in which it was proposed to regulate importation by compelling consumers of potash to use 20% of the domestic product with 80% of the foreign product, and forcing them to show that they did use their domestic allotment before they could procure the imported potash. It will be noted that another Department, that of the Interior, is taking a hand. This is typical of the rivalry and confusion created at Washington by the overlapping of the various branches of the Administration, and it may prove a factor unfavorable to decisive action by Congress. It is to be hoped that those convinced of the advisability of stimulating the domestic production of potash by restricting importation will act in concert, with a view to the enactment of requisite legislation. In 1918 the maximum price was \$6 per unit (of 20 pounds) on a 35% K_2O product; soon after the Armistice the price dropped to \$4; now it is \$2.50 per unit. Before the War the price of German potash was 80 cents per unit. This low price is not likely to be maintained, for it has been reported recently that the potash producers have asked the German government for permission to double the price of their output owing to the increased cost of production since the War. However, even at the doubled price they will be able to invade our market unless the American producer is protected until he has developed the domestic industry to greater commercial strength.

Government and the Cost of Living

Among the coruscations of the Ford libel suit, we note Professor William A. Dunning's statement that "the essence of government is force." This bit of wisdom came like a flash of lightning in the darkness of nonsense. There are those who seem to think that the essence of government is talk, so they load the 'Congressional Record' with their lucubrations. Others seem to think that government is synonymous with legislation, so they pass laws the effect of which they can only vaguely anticipate. At the present moment the lack of force in government is evident in all the principal countries of the world. Indeed the outlook is anything but cheerful. The Bolsheviks may be rampant in Russia and the 'istas may be on the rampage in Mexico, but what of our leading exponents of the democratic idea, England and the United States? On the first day of August our morning newspapers told

us that the president of the Brotherhood of Locomotive Engineers had given notice that unless the wages of the train-men were increased or the cost of living reduced, there would be a big strike on October 1. When organized labor uses the threat of paralyzing railroad traffic over the entire country in order to get an increase of wages—already raised several times since the Government assumed control of the railroads—it is engaging in sabotage. The next day another leader of the Brotherhood stated that the railroad workers “would not stand for a survey of the entire wage situation.” He wanted to use the club at once; indeed, 130,000 workers in the railroad-shops would not wait even for a day, and went on strike forthwith. In England matters are even worse, for not only had the cotton operatives of Lancashire, the coal miners of Yorkshire, and the dockers of Liverpool stopped work, thereby increasing the cost of cotton, coal, and food, but a triple alliance of railway men, miners, and transport workers was threatening a general strike, and, worst of all, the police, the guardians of the law, menaced the very foundations of orderly government by themselves going on strike. Meanwhile British taxpayers are meeting the cost of the pay given to the unemployed by means of a Government dole. Returning to our own country the race riots at Washington and Chicago presented another most lamentable spectacle of lawlessness. Whether these outbreaks between negroes and white trash were due to the desire to kill awakened by military service or whether they were due to attacks on white women, we do not know. Statistics show that only 25% of the lynchings perpetrated in the last 18 months were due to the cause commonly supposed to explain these horrors. We conclude that the bloodshed and incendiarism at Chicago and Washington may be ascribed in large part to shortage of food and secondarily to the brutishness engendered among the weak-minded by the experience of warfare. Most of the unrest and violence recorded recently among laboring people is due, we believe, on such evidence as is obtainable, to the irritation caused by the high cost of living and the belief that much money is being made by profiteering. Telegrams from Washington say that the Attorney-General is taking the matter in hand and has started by calling a number of chiefs of departments into consultation with him. We are told also that the President “is giving deep and very thoughtful consideration to the problem.” It is well that he should, for, unfortunately, most men and women are more sensitive to matters affecting their personal comfort than they are to the larger questions of politics or even the idealisms of international concord. We see no reason why the President should not submit the question to men so experienced in national alimentation as Messrs. Herbert Hoover, Alonzo Taylor, and Vernon Kellogg, for example. Surely it is possible to do something effective. Meanwhile we venture to say that whether it be possible to decrease the cost of living or not, it is possible to stop the rank profiteering that is evident on every side. Each one of us can cite examples within his own experience. Every tax is used as an

excuse for collecting not only the impost itself, but an additional amount of profit for the seller. Even the man who sells pop-corn gives you a bagful of half the former size for the customary nickel. Why, the rancher from whom we bought eggs excused his raise in price by saying that the War had increased the demand for shells! Joking apart, every man or woman can quote examples of inexcusable prices, based simply on the idea of using the opportunity to profiteer. Agreements exist between producers to control markets, prices are fixed arbitrarily from day to day, food is destroyed in order to maintain high quotations, carloads of fruit are allowed to rot rather than reduce the cost to the public, enormous quantities of foodstuffs bought by the Government for the Army have remained unused. These are matters of common knowledge, and they evoke a keen feeling of resentment. How far the artificial price of wheat has contributed to this state of things, we do not know, but it might well be an act of wisdom to sell this year's wheat at a more nearly normal price and keep faith with the farmers by giving them a bonus out of the guarantee fund. Cheaper flour might lead the way toward a more reasonable market in all staples of food. The train-men's demand for a cut in the high cost of living by October 1 may be preposterous, but it is certain that the subject is one that is engaging the attention of the population of this country, and of other countries, to a point threatening to stop the great measures of international readjustment embodied in the Treaty of Peace and the League of Nations. The force implicit in government can be used to no better purpose than in preventing the hoarding of food-stuffs for the purpose of creating an artificial scarcity or in disciplining those who under cover of abnormal conditions set to work to exact excessive profits on the sale of the essentials of life. The force accorded by the people in a democracy to the government is supposed to be used for the general good in restraining those whose actions are subversive of order or otherwise hurtful to the community. It is assumed that the representatives of the people are given the power of government in order that other citizens may go about their business undisturbed. We elect our representatives, in the municipality, the State, and the Nation, to perform this function because the people themselves cannot perform it. The alternative is mob-rule or a war of parties. When Abraham Lincoln spoke of government “by the people,” he did not mean it literally, for that were impossible, the governing being done by the representatives of the people in behalf of all the people, rich or poor, wise or foolish, white or black. It is just as necessary that the labor-unions or the industrial corporations should not arrogate to themselves the settlement of affairs that concern all of us as it is that our representatives shall have the initiative and the intelligence to use the force entrusted willingly to them for the benefit of all the people; in other words, government need not cease to be virile because it is democratic. Just now the first duty of statesmanship is to abate the high cost of living by regulating the sale and distribution of the necessities of life.

DISCUSSION

The Chloride Volatilization Process

The Editor:

Sir—Mr. Blamey Stevens has presented an excellent digest of this process in your issue of July 12. I wish to comment on the paragraph in which he says, "but laboratory experience shows that sulphides in quantities are detrimental and that the reaction of the salt on silica is even better suited to the formation of metallic chloride."

It is well known that salt is decomposed by silica, yielding chlorine, or, in the presence of steam, hydrochloric acid. I do not deny that this reaction can be used for the conversion of metals into their chlorides, but in the volatilization process for the treatment of ores I do not feel that it has been proved in any degree that this reaction is the one that takes place. My original experiments invariably showed that the nearer the percentage of sulphur approached the amount necessary to form the normal sulphide of the volatile metal, the better was the percentage of volatilization, assuming that an intimate contact between the sulphide and the salt was obtained during the roast. In commercial operations it would be impossible, of course, to prove this rule on ores containing only gold or silver with no volatile base metal, because the amount of sulphur combined with the gold or silver would be infinitely small; but in ores containing lead, for example, the sulphur combined with each per cent of lead to form the normal sulphide is only 0.155%, which is sufficient to form a complete reaction with the salt and produce a volatilization of the lead.

I have been told that much of the experimental work in Utah has been done on oxidized ores containing about 2% lead. This would require, therefore, only 0.3% sulphur to secure a commercially complete volatilization of the lead, and any silver or gold present would be volatilized at the same time by similar reactions. There are few oxidized ores of this character that carry less than 0.15% sulphur in some form, for each per cent of lead present. Since the SO_3 radical will attack salt at a much lower temperature and hence more quickly than the SiO_2 radical, I do not see any foundation for the claim that the chlorination of the volatile metals in ordinary ores is attained through the decomposition of salt by means of silica.

In further support of the above-mentioned statement, it is true that the excess of sulphides has always proved detrimental, but from the very fact that the salt and sulphur are the first to react. Let us take, for example, an ore containing a small percentage of galena and considerable pyrite. Salt is added, but not in sufficient

quantity to react with all of the sulphur present. The pyrite, oxidizing at a lower temperature than the galena, will react with all of the salt and little or no volatilization of the lead will be effected. If sufficient salt is added to react with *all* the sulphur present, including that combined with the lead, volatilization of the lead will take place as long as the oxidation of the sulphur occurs, but, with the formation of so much sodium sulphate, the particles of ore are soon coated with this easily fusible salt and are thus removed from the oxidizing atmosphere, so that further reaction and volatilization cease.

For another example, let us consider a sulphide ore with opposite characteristics, like the Broken Hill ore in Australia. In this, one might expect the more easily oxidized galena to be volatilized in preference to the less easily oxidized zinc sulphide, but the latter oxidizes with sufficient rapidity to react at all times with the salt, and volatilization is again controlled by the relation of salt and sulphur without regard to the silica present. If, on the other hand, the ore be preliminarily roasted to reduce the sulphur content to the amount that will theoretically form a normal sulphide with the lead present and then sufficient salt be added to react with that sulphur, the lead can be preferentially and completely volatilized from the zinc, as was shown in my original work.*

It will be seen from these examples that, in the case of sulphide ore, the sulphur is the controlling factor for the salt, and if the necessary quantity of salt is added to react with all the sulphur present in the ore, the detrimental effect is due to a physical cause, namely, the fusion of the sulphate of soda around the ore particles, which stops chemical reaction and is not due to chemical causes. Otherwise, complete volatilization of the metals could be effected without difficulty.

We found it impracticable to use more than 10 to 12% salt on any ore; consequently the sulphur in the ore treated should not exceed one-quarter of this amount, that is, 2.5 to 3%.

The sintering of the ore will depend largely on the composition of the gangue. A silicious ore, roasted with 10% salt, has a tendency to nodulize in a cylindrical furnace, probably as a result of the formation of sodium silicate as well as of sulphate. These nodules disintegrate to the original sandy condition on exposure to the weather. Neutral ores, or those containing iron and lime bases in sufficient quantity to form an easily fusible slag with the silica, naturally have a still greater tendency

*'Engineering & Mining Journal', August 29, 1903.

to fuse or sinter with the addition of the sodium salt. Base ores, or those having a large excess of iron and lime, discharge from the furnace in the same sandy condition as they were when charged, and are the most satisfactory ores to treat by the volatilization method.

In regard to furnaces, we found the cylindrical furnace the most satisfactory type to use, and in our experimental plant we used a White-Howell furnace lined throughout with brick. It was 25 ft. long and 3 to 4 ft. in diameter. In my original paper I recommended furnaces of this type 30 to 50 ft. in length with proportionate diameters. Such furnaces were installed in the Mayer plant. I do not know the size of the furnaces used in Utah, but, like pioneer installations in many other lines of endeavor, I now believe that all these furnaces were too small, and that a regular cement kiln 75 to 100 ft. long would give better results. In the early days of electric tramway installation it was thought that if two horses could pull a street-car, a 15-hp. motor would be ample for electric propulsion. It was soon discovered that a 30 or 40-hp. motor was necessary to yield satisfactory results. It is reported that Curtis was able to fly with the ill-fated Langley aeroplane when he equipped it with a more powerful motor.

The volatilization of metals can be completed in 20 to 30 minutes and better results can be obtained by passing a thin stream of ore through the furnace at this rate of speed than by carrying a heavier bed of ore and roasting a longer period of time.

Now that the Cottrell process has solved the fume difficulty the remaining unknown is the commercial efficiency of the furnace. All subsequent investigators have confirmed but added nothing to my original results. The volatilization and recovery of potash have been commercially demonstrated at cement-plants. It would appear from these, that it is not "investigation by expert chemists" that the process needs, but a more powerful motor to make the known factors operative.

Denver, July 15.

STUART CROASDALE.

Mr. Picard's Address: Saying and Doing

The Editor:

Sir—In commenting editorially on the presidential address of Mr. Hugh F. K. Picard before the Institution of Mining and Metallurgy, you said, in your issue of July 5, that the excellent principles which he so ably propounded are "evidently of an academic character and intended for non-domestic application." You intimated that while he preached in a very generous and high-minded fashion, the Minerals Separation company, of which he is an important part, practises in a manner exactly the reverse. One of your sentences was: "It is inconceivable that a technician capable of an outlook so scientific and philosophic, as that embodied in the presidential address, could have advocated the steps taken by the Minerals Separation company, in this country, to gag the profession."

Now, I wonder whether the policy of publicly advocat-

ing high-sounding and inspiring principles, particularly before dignified bodies, and then acting exactly contrary to them, is so inconceivable and uncommon as you imply. Is Mr. Picard alone in this seeming inconsistency; do not other "philosophical technicians" and industrial leaders do likewise, or, for that matter, leaders in business and politics generally? In other words, is it not the custom for an eminent man, when called to 'make a speech', to utter soul-inspiring cheer-arousing sentiments which he really does not believe in at all?

Perhaps it is because we are so practical a people that we do not practise what we preach; perhaps it is because we like the sound of pleasant words. Emerson said: "What good, honest, generous men at home will be wolves and foxes on 'change'. What pious men in the parlor will vote for reprobates at the polls." There is an old aphorism that says that between saying and doing, a man may marry his daughter; and Macaulay said: "Only imagine a man acting for one single day on the supposition that all his neighbors believe all that they profess and act up to all that they believe."

Undoubtedly a young engineer accustomed in his college work to proceed logically and consistently has to learn the difference between words and actions when he gets among so-called practical men. It is in "the college of hard knocks", as 'Life' has called it, that the young man finds out such great empirical truths. Though this matter is not a technical one in the sense that the 'Mining and Scientific Press' is a technical periodical, it has a very direct bearing on technical matters, such as, for instance, the flotation process.

P. B. McDONALD.

North Adams, Massachusetts, July 10.

The Leaching of Flotation Concentrate

The Editor:

Sir—Mr. Greenawalt's letter in your issue of June 28 on the leaching of flotation concentrate should prove valuable and enlightening to those who are giving attention to the leaching of copper, whether from concentrate or ore. In the case of the leaching of material containing the copper as a sulphide, arsenide, or native metal, the following quotation is apt and should be emphasized: "I am convinced now, as I was then, that the solving of the problem of the ferric salts will be along the lines of making the iron work with the process." On the other hand, for the leaching of oxidized material, this can hardly apply.

There was a time when the future of the treatment of copper ores with ferric sulphate might have looked as bright to those who were looking forward in copper metallurgy as the electrolytic refining process itself, but early difficulties, which were not overcome at the time, have relegated this process to the background most decidedly; nevertheless this procedure has great intrinsic merit, perhaps as great as electrolytic refining. In this process, if metallic copper or copper sulphide (some sulphides, such as chalcopyrite, react very slowly unless

finely ground) is treated with a solution of ferric sulphate, which can contain free sulphuric acid or not, copper goes into solution as sulphate, and the iron is reduced to ferrous sulphate, thus

If a sulphide is being treated, sulphur is left behind unattacked. This solution can be passed through a properly designed and operated electrolytic tank, and with an efficiency of over 90% can be made to yield good cathode copper, and the ferric sulphate solution regenerated, to be used over again in order to carry another batch of copper from the ore or concentrate to the cathodes in the cell. Notwithstanding that this process has not 'arrived', it is nevertheless of great importance for the future.

I have demonstrated the utility and practicability of this reaction by numerous and elaborate experiments, to my own satisfaction. The amount of electric power consumed is reasonable, the copper may be deposited in fine shape, and the solution is cheap and easily handled. Details of these experiments and construction of cells are given in my book 'Lead Refining by Electrolysis', pp. 102-111 and 260-267.

This process differs from that described by Mr. Middleton in your issue of June 7, in that the concentrate or ore must not be roasted before leaching. Even the presence of oxides or carbonates of copper in the ore or concentrate upset the balance of the solution after one or more treatments, according to the percentage of oxidized copper contained; if the amount of oxidized copper is not excessive, the use of reducing agents such as hydrogen sulphide, sulphur di-oxide, and scrap-iron plus the chemical equivalent in sulphuric acid, properly applied to maintain the proper balance, is entirely practicable. The quantity of such reducing agent needed, is ideally, or theoretically (as is usually said), that amount which would reduce the copper oxides to metal, and practically the amount would not be far different.

Nyack, N. Y., July 2.

ANSON G. BETTS.

Botulism

The Editor:

Sir—Mr. Shockley's letter on this subject, in your issue of July 5, recalls to my mind a sad case of poisoning by botulism in 1912, at the Mary Murphy mine, when five persons, including mine superintendent, surveyor, tramway construction foreman, a teamster, and a visitor all fell victims to the terrible disease.

It is so deadly in its effects (in our case all the persons affected died, excepting two rather doubtful cases) and so difficult to prevent or diagnose, and moreover, mines in out-of-the-way places are so peculiarly exposed to the danger, that it should be more generally known. As I understand the matter, botulism is caused by a specific anaerobic (one which cannot exist when exposed to air) bacillus, which occurs in the flesh of hogs, and which probably may occur in any nitrogenous food that has not been heated to a temperature exceeding

100°C. It is quite distinct from ptomaine poisoning, which is due to some form of decomposition; the foods infected by botulism are not 'spoiled' in any ordinary sense, and, except from the effects, it is impossible to detect it in the food. A large proportion of the people who contract it die, so that testimony as to the effect of the poison on the flavor and appearance of the food is meager; but there is some testimony which suggests that it is more 'savory' than usual. In the case of canned vegetables a slightly rancid odor has been recorded.

In our case at the Mary Murphy, the official investigators of the State Board of Health attributed the poisoning to canned spinach, but the evidence on which they based their conclusion was later clouded by the fact that one person, who had not eaten the canned spinach, died. Another suspected food was canned string-beans. There was no absolute certainty even as to which meal caused the poisoning. My own belief is that the food which caused the poisoning was sausage (wienerwurst), but several persons who ate of the sausage did not contract the disease. Possibly only some of the individual sausages were infected. The canned spinach, the beans, and the sausage had been subjected to the heat of boiling water, which, if sufficiently protracted should, according to the testimony of all investigators, have destroyed the bacilli and presumably the toxins produced as a result of their existence in the food. I have always attributed the tragic result at the Mary Murphy to the fact that, owing to the altitude of that property, water boils at a temperature below 100°C. I think this point is of the utmost importance—*no pork or ham, and no canned foods, should be eaten unless cooked at a temperature known to be above 100°C.*

All the investigators agree as to the extremely deadly nature of the poison, and that the minutest quantities may cause death. In the Mary Murphy case, death occurred at intervals between 36 hours and three weeks after the suspected food had been eaten. The characteristic symptoms were ptosis of the eyelids, double vision, lack of muscular co-ordination, tenacious mucus in the throat, paralysis of the muscles of the throat, inability to speak, constipation (not diarrhoea as stated by Mr. Shockley) and (perhaps most characteristic of all) intense apprehension of impending death. In every case the patient's mind was clear up to the moment of death.

The first two symptoms mentioned were marked even in the earliest stages. An English friend who was at the mine as a guest, Mr. Leveson-Gower, seemed to be very slightly, if at all, affected; but careful testing showed evidence of these two characteristic symptoms 36 hours after the poisoning, although he was in no way inconvenienced at that time. In fact, the mine doctor had pronounced him entirely unaffected; and it was merely as a matter of personal interest that I tested his ability to walk a straight line, etc. Nevertheless, other symptoms developed a few days later, and in his case also death occurred two weeks after the poisoning; although by that time the serious nature of the disease was fully realized, and the best of medical skill and nursing was

available. Apparently there is no cure; unless a serum treatment, on which Van Ermengem was working several years ago, has since been perfected. The disease however is so rare, and so obscure, that it is hardly possible such a serum could be generally available for use. The only complete safeguard seems to be adequate cooking of all preserved food.

GEORGE E. COLLINS.

Denver, July 10.

The English-Speaking Peoples

The Editor:

Sir—The Bulletin of the Canadian Mining Institute for March last contained an article by yourself entitled 'The English-Speaking Peoples'. Practically the only reference to Canada in that article was in regard to the War of 1812. To quote your own words, "The so-called War of 1812 . . . was a tempest in a teapot: on land it was badly fought by both sides." As practically all the land fighting was in Canada and on this side was done by Canadians assisted by a few British regulars, your statement means that you consider that the Canadian forces fought badly. I went to some trouble to give you in a personal letter a Canadian point of view and as I have lived in Canada all my life I feel that I am somewhat in touch with the Canadian sentiment in this matter. I asked you in future, when dealing with Canadian history, to give us better consideration. I was prepared to let the matter drop there.

I have no apology to make for anything I said in my letter. Apparently, however, I wasted my time for in your issue of June 28 you not only re-print your article with the offensive paragraph intact but you publicly denounce me and other Canadians who may "hark back to 1812" as having jaundiced minds, belonging to the class of Bourbons who can forget nothing and learn nothing, etc., etc. Your claim that because your ancestors came from both the American and British nations you are qualified to pass judgment on Canadian affairs is worthless. Canadians have suffered nearly as much from British historians as from American. Too many British people because their ministry was wrong in their treatment of the American colonists consider the whole matter a distasteful subject and accept the American version not only for the American Revolutionary War but also for the War of 1812.

I do not propose to enter into any argument in regard to causes and actions during the war. You can believe with certain New Englanders and New Yorkers of that day that the cause of freedom would have been better served by declaring war against France instead of England or you can believe with Lyman Abbott in the New York 'Outlook' that the Americans "won for themselves and all humanity that freedom which had been denied them." You can believe with the New York 'Life' that "if the American militia had been any good in 1812 Canada would now be a part of the United States", or you can believe with your juvenile friend that the Americans "licked" the British, that it was a no account war

and that the Canadians fought badly. The point I wish to make is that Canadians believe that their forces saved this country for the Empire in the day that the parent looked after Napoleon, and that was no mean achievement. ●

The War of 1812 was the outstanding event in Canadian annals in the last century. It was more important than Confederation for if the Americans had succeeded in their designs on Canada there would have been no provinces to confederate. Canadian national heroes are the men and women who fought in that war with courage and ability and heroism and who died facing heavy odds. There were many such—there had to be. As long as Canadians believe these things I will leave your readers to judge whether you will help any by attempting to belittle a Canadian national event of the first importance, by a sneer for the Canadian defence of that day and by abuse of those who do not agree with you. "We need more tolerance", you say. It seems a pity that you are unable to take a little of your own advice.

In conclusion I wish to quote a remark by the editor of the 'Canadian Courier' of Toronto, an outstanding Canadian weekly. I would particularly draw your attention and the attention of others who go out of their way to dictate what Canadians should believe, to the last sentence. "The entente cordiale between Canada and the United States is a thing unknown in either Europe or Asia. We expect on this side of the line to make it absolutely fool-proof for the sake of ourselves, the Empire and the Anglo-Saxon Alliance. But if we are to carry our part of the load we are entitled to our own opinions."

Phoenix, B. C., July 17.

C. M. CAMPBELL.

THE buying of copper which has been under way for the past few months has begun to make inroads upon the huge surplus which has been piling up at a rapid rate since last November. It is estimated the country's stocks have dropped below the billion-pound mark. The Government-owned copper, which producers agreed to market within 15 months, has all been sold. Only three months were required to accomplish the task. Originally placed at 140,000,000 pounds, the Government holdings were actually less than 100,000,000 lb. and practically every one of the leading producers took a proportionate part to work in with his own sales. June copper sales were substantial, although they fell short of the May total of 207,000,000 lb. The movement of copper to consuming points was interrupted last month owing to labor troubles at Connecticut manufacturing centres. The July delay will be on the part of producers.

THE production of gasoline in the United States increased tremendously during the War period. Thus, the output of rather less than 50,000,000 bbl. in 1916 was increased in the following year to more than 68,000,000 bbl., and during 1918 the production amounted to over 85,000,000 bbl. Exports, mainly to the Allies, rose from 8,473,102 bbl. in 1916 to 13,213,508 bbl. in 1918:

Skip-Changing Device at the Steward Mine

By OLIVER E. JAGER

The device for changing skips at the Steward mine, in the Butte district, Montana, is of the hinged-guide and crawl type. The general arrangement is illustrated in the photograph, which shows the crawls running on a 20-in. I-beam (65 lb. per ft.), supported by brackets attached to the head-frame. The drawing shows the I-beam supported by posts and framing, but this design

The guides are built up of steel angles, and are hinged for 36 ft., which distance is sufficient to allow the free exit of the string of cages from the shaft, and for the same reason the hinges are arranged to allow the guides to swing clear of the inside faces of the guide-posts, as shown in the near view. The lower extremity of each hinged guide is at a point 10 in. above the shaft-collar.

TWO SKIPS CHANGING ON CRAWLS

HINGED GUIDES SHOWN OPEN

has been changed in favor of brackets. The I-beam must be set out from the shaft a sufficient distance for the cage or skip to be in the clear when it hangs free on the crawl. This distance will also determine the length of the hanging chains on the crawl, as they must be long enough to allow of their being attached to the cage while the latter hangs in the shaft. There are three crawls with a capacity of about 6 tons each; they have hand-chains and gearing for moving them along the I-beam, but do no lifting.

which means that the ends of the fixed guides project that amount when the hinged guides are open. The guides are hinged at five points, and at each hinge there is a pin that locks the guide in normal position in the shaft, provision being made for all these pins to be withdrawn simultaneously on each compartment. This is accomplished, as shown in the drawing, by a lever connected to a bell-crank which actuates the rods carrying the pins. The drawing also shows a lever for holding the

DETAIL OF BAR CARRYING LOCKING-PINS FOR HINGED GUIDES

cable while the change is being made. This has been superseded by a hand-bar with a forked end. A platform on the head-frame is placed in a convenient position for performing all the operations in connection with changing skips, while the opening below the I-beam is railed around with 2½-in. pipe for safety.

To explain the operation of the device, let it be supposed that the two compartments of the shaft have been working with skips, and that it is desired to change these for cages. Three men are required, one at the shaft-collar and two on the operating-platform. Let the crawls be numbered from the left, No. 1 crawl being empty, while No. 2 and 3 have each a string of four cages hanging on them. The skip in the left-hand compartment is stopped just below the collar of the shaft, and the locking-pins of the hinges drawn. The guides are swung open by a bar in the hands of the man at the shaft. Slowly turning his engine, the hoist-engineer now brings the skip up to a point where the chains of crawl No. 1 can be hooked into special eyes on the crosshead of the skip. On lowering, the skip swings out of the shaft and comes to rest under the I-beam, the crawl carrying it. The two men on the platform now disconnect the rope from the skip and move crawl No. 1 away to the left, bringing crawl No. 2 into its place in front of the left-hand compartment. One of the men, with the forked bar, holds the rope while the other man connects it to the top cage of the string. On hoisting a little, the cages pass over into the shaft, where they are held while being unhooked from the crawl. They are next carefully lowered so as to slide onto the guides at the shaft-collar (assisted by the man with the bar), after which the hinged guides are closed and locked, and the left-hand com-

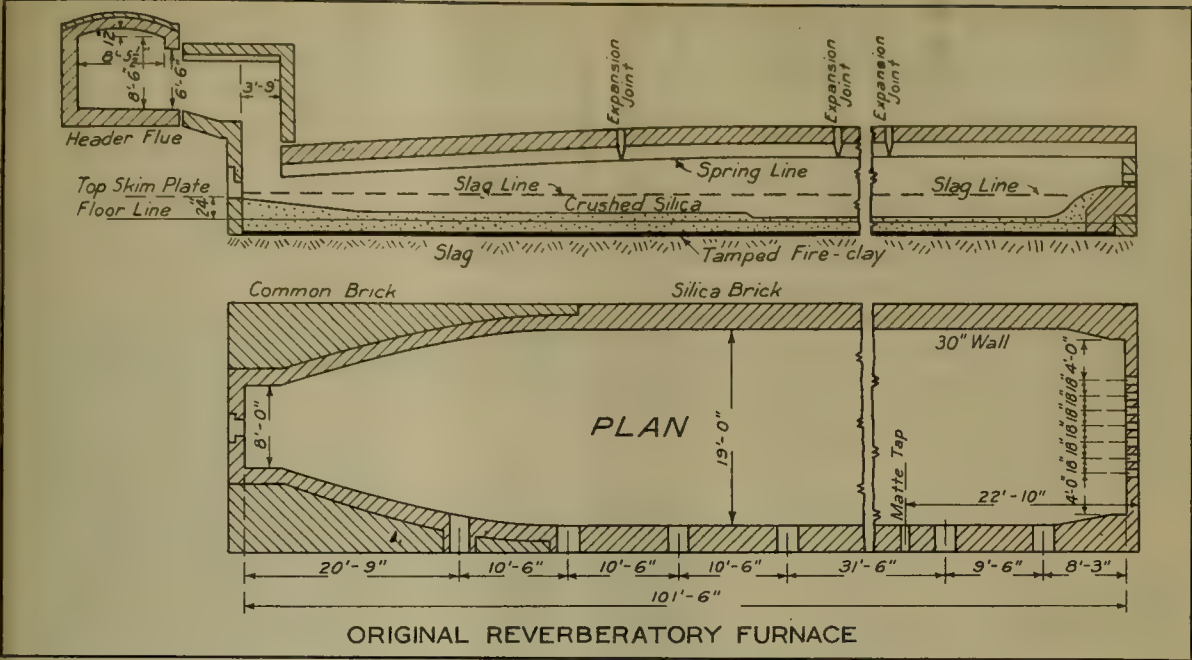

partment, with its string of cages in position, is ready to resume work.

The operation is repeated for the right-hand compartment; crawl No. 2, now being empty, takes the skips from the shaft and is moved to the left out of the way, while crawl No. 3 is brought up, relieved of its load of cages and left standing empty. When the change is next made, the operation will take place in the reverse direction, or from the right hand, though it is quite immaterial from which side the change is made. The loaded crawls are easily moved by one man. The time taken in changing skips in the two compartments is from 6 to 10 minutes.

This method of skip-changing has been working satisfactorily for some time. It has the advantage over the swinging-guide type that it requires no compressed air for its operation, nor the excavation and timbering of a chamber beside the shaft collar. For doing light repairs or painting, it is proposed to utilize the accessibility of the skips and cages left hanging on the crawls.

THE VALUE OF PRECIOUS STONES annually produced in the United States from the beginning of this century to 1914 has been about one-third of a million dollars. In 1914 and in every year since, the annual value of the output has dropped considerably, and in 1918 it dropped to \$106,523, the lowest reported since the U. S. Geological Survey began to collect statistics of gem production, in 1883, with the single exception of 1896, when it was \$97,850. The report on the production of precious stones in 1918, just published by the U. S. Geological Survey, ascribes the decrease in the value of the precious stones produced to the military enlistment of many gem miners, the general scarcity of labor, and the poor market. The output consisted chiefly of the sapphire variety of corundum, which is nearly all used as mechanical bearings in watches and other instruments that require practically non-wearing frictionless bearings. Other less valuable and softer minerals used for this purpose are garnet and some forms of hard compact silica, known as agate and chalcedony. The annual value of the output of the four gem minerals, corundum, quartz, tourmaline, and turquoise, amounts to over four-fifths of the total value of all the precious stones produced in the United States. Montana, Nevada, California, Colorado, Maine, and Arizona are the chief gem-producing States, but from 20 to 30 States annually report some production. Several relatively large diamonds were found in Arkansas in 1918, notably a canary-colored octahedron weighing nearly 18 carats and a number of smaller stones weighing several carats each. The value of all the diamonds produced in the United States, however, in no year exceeds a few thousand dollars.

CONSUL GENERAL ALBERT HALSTEAD reports from Stockholm, Sweden, that the commissioners of the Iron Office complain as to the price of fuel and express anxiety as to the effect of this price on the iron industry. Coal that used to cost 16 crowns per ton delivered at Göteborg now costs 100 crowns.

A Step-Bearing for the Wedge Roasting Furnace

STAFF CORRESPONDENCE

The usual conical roller-bearings on which the Wedge furnace-column revolves, have been superseded at Anaconda by a step-bearing, first proposed by J. Kane Murphy, assistant superintendent at the Anaconda reduction works. Fig. 1 shows the old form of construction with conical rollers, and is included for purposes of comparison. This is not the standard method of supporting the Wedge furnace-column, but, as the furnaces equipped

The two buttons differ in that the upper one is drilled for the $\frac{1}{2}$ -in. oil-pipe which comes down the centre of the shaft, while only the lower button has the oil-grooves as shown. Both buttons are recessed for steel pins, *H*, which serve to hold them fast to the bottom of the shaft and the bottom of the housing respectively. *J* is an oil-drain tapped for pipe and valve.

The housing is made in halves bolted together by 2-in. bolts, and attached to a cast-iron base, *K*, which is bolted to the concrete foundation. By supporting the weight of the central column on jacks, the bearing may be taken apart for examination. At such times, the dirt that has collected in the grooves, *F*, is removed, and the buttons changed if necessary, although these have been lasting over a year, and have given such good service that experiments are being made with bearing-surfaces of less area. A button of 6 in. diameter at the bearing-surface will probably be adopted in future. Lubrication is regulated by a valve controlled from outside the central column, as shown; and there is provided a dust-protecting ring, *L*, consisting of a $\frac{3}{8}$ -in. layer of canvas clamped between iron rings.

The results obtained by the use of this improved bearing have been very satisfactory, the decrease in the high cost of repairs having more than justified the change, without considering the further decrease in cost because of fewer interruptions than with the old design.

FIG. 2

in the regular manner were having bearing troubles equal to those supported as shown in Fig. 1, it became imperative to devise some other form of bearing to decrease the interruptions in operation and the numerous repairs. The new bearing is shown in Fig. 2.

The central column of the furnace is attached to a hollow casting, *A*, which carries the bevel-gear. This casting fits tightly on the tapered portion of the shaft, *B*, which revolves inside a hard bronze bushing, *C*, made in halves. The bushing is prevented from moving by being pinned to the cast-iron housing, *D*, by pins, *E*. The inside face of the bushing has the usual diagonal oil-grooves, as well as three horizontal grooves, *F*, for collecting any dirt that works down between the shaft and the bushing. The buttons, *G*, are the principal features of the arrangement, and are of Crescent tool-steel, hardened to such a degree that a file will not cut them. They form the actual bearing for the weight of the central column, which is estimated at 80 tons. This gives a pressure on the bearing-surface of 2.08 tons per square inch, a high figure, but possible on account of the slow speed. As can be seen from the detail, the buttons are beveled to present a bearing-surface of 7 in. diameter.

FIG. 1

Coquina: The Shell-Rock of Florida

By WALTER M. BRODIE

The Spaniards settled on the coast of northern Florida and began to form a permanent colony on the site of the City of Saint Augustine in the middle of the 16th century. In 1565 this settlement was already of some im-

COQUINA, OR SHELL-ROCK

portance and building material was in demand. Adobe clay was not to be had, but the shell-rock of Anastacio island was so near at hand that it could be used satisfactorily. The rock, in fact, was so satisfactory for building purposes that the site for Fort San Marco was probably chosen because the coquina rock was found near-by. Coquina therefore has been used as a building material for three centuries and a half, and the old Spanish buildings still standing certify to its lasting qualities.

Coquina consists of a mass of shells and fragments of shells, fastened together by a natural calcareous cement. The shells originally accumulated on the beaches and bars, where they were exposed to the action of wave and tide, and where the finer sand was mostly washed away, leaving the shell fragments comparatively clean. Later the land was elevated, probably some 25 or 30 ft., and in the course of time the rain-water, moving slowly down through the layers of shells, and acidulated by carbonic acid and may be by the acid products of vegetal decomposition, carried enough lime carbonate to form, after evaporation, the material required to cement the shells. Between the shell fragments there generally is some sand, which in course of time may have helped to strengthen the bond. When coquina rock is broken or crushed, a considerable quantity of silicious sand can generally be sifted out.

In some places the shells are very firmly cemented; in

other places they are not cemented at all; therefore the Spaniards had to go to considerable trouble to find the harder and more resistant layers for use in their constructions. The rock had the great advantage that on exposure to the weather it did not deteriorate; in fact, on drying the rock hardens and when built into walls in the course of years the bond stiffens. Well-jointed blocks in old structures are now found to be tightly cemented.

This coquina, together with the shell-marls of Florida, is labeled Pleistocene. In 1824 Thomas Say reported upon the shells contained in the Saint Augustine shell deposits and in 1908 a collection of the invertebrates of the shell-marls of Florida was made by the Florida State Geological Survey and the U. S. Geological Survey. A list of these invertebrates of Pleistocene age is found on page 151 of the Second Annual Report of the Florida Geological Survey.

The shell-marls of Florida form a continuous bed along the coast and reach many miles inland. The thickness of the Pleistocene is reported to be 66-68 ft. at Ormond and about 70 ft. at West Palm Beach, but the solidified layers of coquina building-stone in the neighborhood of Saint Augustine have only been found, it seems, above the present water-level.

The coquina occurs along the coast south from St. Augustine for a long distance and the sand-dunes indicate where it may be found. These sand-dunes are not always near the beach. Near Daytona and Titusville they are found a couple of miles inland. On Anastacio island, however, the coquina reaches out into the ocean.

A CORNER OF FORT MARION, SHOWING BULLET-MARKS

The hard shell-rock occurs in strata irregularly alternating with softer layers of shell and sand. Hatchets and axes were used in trimming the stones, which, however, were hard and solid enough to stand rough handling. In the sea-wall of St. Augustine many blocks can be seen which measure $4\frac{1}{2}$ by 3 by $2\frac{1}{2}$ ft., and the fact

that they were quarried, hauled by teams to the Matanzas river, shipped in boats, and unshipped near the work proves that they had considerable resistance. The walls of the old Spanish fort, San Marco, now called Fort Marion, and the sea-wall of St. Augustine show that the coquina rock stands the climate of northern Florida wonderfully well. Still, the rock is not hard and the bonding cement between the shell fragments is often hardly noticeable. One wall of the fort, where prisoners sometimes were released from captivity, shows that coquina walls were not very well adapted for the purpose, as they show the bullet marks much deeper than adobe walls would.

The coquino, however, though it can be worn by abrasion, is affected very little by wind and water. There are names and dates cut in the rock, where the tides wash it, that are 35 and 40 years old, and that can still be deciphered. Still, the rock is soft enough for the building-blocks to be rubbed smooth and true with a rubbing-stone, or to be cleaned and re-faced by rubbing off the surface.

As a natural building rock, this coquina is probably now a thing of the past. Today it is cheaper to use the loose shell deposits that are found close to transportation and to bond this material into blocks with sand and Portland cement, than it is to explore for harder layers, to cut the blocks, and to carry them to railway. The coquina rock, however, will always have a historic interest and remain a monument to Spanish enterprise, intelligence, and thoroughness in colonization.

MINING is a most important industry throughout Siberia. The supply of machinery and equipment for the carrying on and extension of this industry must continue to be a trade of considerable proportions. The deposits of gold, silver, lead, zinc, and copper have been energetically developed, mainly with British capital, in the Ural mountains, the Kirghiz steppes, and the Altai mountains, and in central and eastern Siberia. Placer mining is carried on throughout central and eastern Siberia, the fields of the Lena river and the Amur district being especially important. Coal is found in various parts of the country, and the rise in the price of wood has led to the exploitation of the mid-Siberian fields. Rich coal beds exist on the island of Sakhalin and along the Pacific coast. Deposits of iron ore are found near the coalfields in the mountainous districts, but are waiting proper transportation facilities for their profitable exploitation.

THE U. S. GEOLOGICAL SURVEY now has ready for distribution its annual statement on the sand-lime brick industry in 1918. This report contains statistics of the production of sand-lime brick since the beginning of the industry in the United States, in 1903. It also contains information of interest to those engaged in the building industries and in the manufacture of building brick. A copy of the report may be obtained by application to the Director, U. S. Geological Survey, Washington, D. C.

Amendments to Compensation Laws

On July 22, 1919, the amendments to the Workmen's Compensation, Insurance, and Safety Act, as adopted by the last Legislature of California became effective. The Industrial Accident Commission has prepared a summary of these amendments. Seventeen changes were made in the Act. The waiting period was reduced from ten days to seven days. Compensation will be payable to the injured man on the eighth day after he leaves work as the result of an industrial injury. When an employee under 16 years of age is injured, it shall be the presumption that such injury was not caused by serious and wilful misconduct. Serious and wilful misconduct cannot be charged against the injured employee by the employer if the injury is caused by the failure of the employer to comply with any provision of law or any safety order of the commission with reference to the safety of places of employment. In claims of serious and wilful misconduct made against the employer, the general superintendent is made responsible for the corporation, as well as the executive or managing officer. Non-resident aliens are required to prove their dependency and cannot be conclusively presumed to be dependent. Applications for adjustment of controversies may be filed with the Industrial Accident Commission by the attorney or other representative of an injured employee, if authorized to do so in writing. A lien against compensation will be permitted for the support of dependents, as well as for the living expenses of the employee. Self-insurers shall not be required to pay any sums into the State Compensation Insurance Fund to cover liability for compensation, excepting in life-pension cases. It is a misdemeanor not to report forthwith a fatal industrial injury, by either telephone or telegraph, to the Industrial Accident Commission. An injunction may be issued against an unsafe place of employment if it constitutes a serious menace to employees, provided that such application for an injunction comes from the Industrial Accident Commission or a member of the Commission. The Commission is authorized to tag dangerous machinery and the use of such machinery is prohibited until the tag is removed by an authorized representative of the Commission.

Chapter 183 creates a liability on the part of the employers or their insurance carriers, in addition to any liability heretofore fixed by law, in case of the death of an employee who leaves no dependents. Under such conditions it is required that a death benefit of \$350 be paid and the Industrial Accident Commission is authorized to draw upon the fund created for the promotion of re-education and rehabilitation of persons disabled in industry in California. This new law was passed in response to a public demand that crippled men be aided in acquiring new occupations. It will reduce dependency and prove of material benefit to the citizens of the State.

IN 1918 ten Utah shippers produced 5100 gross tons of ore, containing 35% or more manganese.

American Potash

By HERBERT H. ROE

Will America's new potash industry, which served so well during the emergency of war, be able to retain and develop its economic position if confronted by European competition, or shall we soon become dependent again upon foreign nations for our supply of this product?

Under the stimulus of a demand created by the War, the United States in 1917 exceeded its output of the preceding year by over 300%, producing 32,366 tons to the value of \$13,791,922 at prices then averaging as high as \$426 per ton of pure potash, or K_2O . From further statistics recently issued by the U. S. Department of the Interior, the figures for 1918, practically complete, show a gratifying increase to 52,135 tons of potash produced.¹

If our own potash industry is to become established, it must be protected and fostered by the Government at least until such time as it can develop sufficient strength to compete with established industry abroad. The menace can be discerned too plainly already, for a recent Boston report states that French agents are even now quoting on potash from the deposits in the re-occupied Alsatian territory at prices ranging from \$12 to \$40 per ton. The latter approximates the rate European potash commanded in this country prior to the War, up to which time almost our entire supply was derived from Germany. During the year 1913 alone we imported in excess of one-quarter of a million tons of potash, our own production amounting to less than a thousand tons.

The famous potash deposits of Strassfurt, reputed to contain 20,000,000 tons of crude salts, have in the past been mined largely for the benefit of the Imperial German government by the Deutsche Kaliwerke (better known by its propaganda in America as the German Kali Syndicate), and in pre-war days could boast a pay-roll of 25,000.

furnishing practically the world's entire demands. From official statistics it has been estimated that before the War the more efficient German mines—and there were altogether about one hundred operating under government control—could produce potassium chloride with

MAP OF PART OF CALIFORNIA. AFTER U. S. G. S.

¹This confirms the forecast made by Herbert Lang in his article entitled 'The American Supply of Potash', which appeared in the M. & S. P. of Jan. 4, 1919.

a guarantee of 50% K_2O for \$15.54 per ton at a point of production, or at a net cost of \$20.40 per ton landed at Atlantic ports.² On the other hand, it is claimed by the Société de Chimie Industrielle that the vast potash beds near Mulhouse, in Upper Alsace, contain 1,472,058,000 tons of material averaging 22% K_2O , which represents more than 300 million tons of pure potash. Although the grade of salts surpasses that of any other known deposits, it is nevertheless a fact that shipments of potash from Alsace in the past were restricted to 5% of German's total output. Less important deposits of foreign potash, mainly of the rock type, are found in Spain, Italy, Abyssinia, Hungary, Turkey, and Australia.

When the importation of German potash practically ceased on the outbreak of the War in August 1914, the stocks on hand in this country rapidly increased in price, and as this was coupled with an inadequate supply, many vital industries were either crippled or seriously hampered in their operations. The United States government, however, had not been entirely unprepared, for as early as 1912 the Geological Survey and the Bureau of Soils conducted an organized investigation throughout the United States with the object of classifying our potash resources and of stimulating their development.

In reviewing briefly the achievements of the past year, attention should first be given the following summarized Government statistics covering our domestic production during 1918, these figures being complete except for reports from some of the smaller producers:

| Sources | Number of producers | Total production short tons | Available potash short tons |
|---------------------------------|---------------------|-----------------------------|-----------------------------|
| Natural brines | 21 | 147,125 | 39,255 |
| Alunite | 4 | 6,073 | 2,619 |
| Dust from cement-mills | 9 | 11,739 | 1,429 |
| Kelp | 6 | 14,456 | 4,292 |
| Molasses distillery-waste | 4 | 9,505 | 3,322 |
| Steffens waste-water | 5 | 2,818 | 761 |
| Wood-ashes | 26 | 609 | 365 |
| Other sources | 3 | 262 | 92 |
| Total | 78 | 192,587 | 52,135 |

Incidentally, the term 'potash' as generally used, includes all potassium salts, of which the most important commercially are the chloride (muriate), the sulphate, the carbonate, and the nitrate. Since the potassium content in these compounds differs, the trade has adopted potassium oxide (K_2O), known as 'pure potash', as the standard unit of measurement, each compound therefore being valued according to the amount of K_2O contained. America's varied sources of potash salts include saline deposits, brines, natural and artificial bitterns, alunite and feldspar rocks of different kinds, residues, wastes from cement-plants, distilleries, and sugar-mills, and organic materials such as wood-ash, kelp, sugar-beet, and other plants. Potash salts are consumed mainly in the manufacture of fertilizer; they are used also in metallurgy, electroplating, photography, the match, soap, laundry, glass, tanning, and dyeing industries, and for certain medicinal and chemical purposes, and in the manufacture of potash alum, electro-chemicals, and

pyrotechnic mixtures. From statistics compiled by the U. S. Bureau of Mines it is shown that 90% of all the potash produced or imported is used for fertilizers and most of the remainder for explosives, high-grade glass, and the chemical industry.

NATURAL BRINES: It will be observed that three-quarters of our domestic potash supply was secured last year from natural brines, the Sand Hills lakes in western Nebraska notably contributing in excess of one-half of the grand total shown. Later reports indicate that production from this alkaline source was increased to nearly 140 tons per day, an amount which approximates the entire output of the United States during the year now under review. The more famous deposits of Searles Lake, in southern California, will be dealt with subsequently in this article.

ALUNITE: The best-known deposits of this mineral have been under development for some time past near Marysville, Utah, where about 10 tons per day has been produced. It has been demonstrated that as a medium for fertilizer it is possible to increase soil production by 40%. Many millions of tons of potash can undoubtedly be profitably secured from this source if the aluminum, as well as the potassium content, can be commercially utilized.

DUST FROM CEMENT-MILLS: It was stated in 1917 that the total potash escaping every year from all the cement-plants in this country amounted to about 100,000 tons, and that if cement-kiln practice were standardized so that 85% of the potash could be volatilized, the potash so produced would approach 200,000 tons annually.³ There is little doubt but that potash thus recovered as a by-product holds great promise for a production that may be maintained even in the face of future competition. The same holds true in the case of blast-furnace waste-dusts and gases.

KELP: Owing to prohibitive treatment charges this branch of the industry, which during the first half of 1918 furnished about 11% of our production during that period, failed to survive a reduction in the high war-prices and can probably not be depended upon as a future source of potash supply. It is equally unlikely that any action will be taken to carry out the proposal of transplanting areas of Californian kelp to the Atlantic seaboard, although the cost of production would thus be greatly reduced nearer the centres of demand on account of the elimination of high freight-charges.

MOLASSES DISTILLERY-WASTE: The potash residue derived as a by-product from molasses that has been fermented and distilled in the manufacture of industrial alcohol, provides a source of potash that can be expected to continue only as long as the returns cover the cost of concentrating and drying the waste-liquors.

MISCELLANEOUS: In connection with the less important sources of our domestic supply it should at least be men-

²'Our Natural Resources of Potash', by Frederick W. Brown. M. & S. P., Dec. 7, 1918.

³W. H. Ross, U. S. Bureau of Soils, p. 290, Vol. LVI, Trans. A. I. M. E.

tioned that the treatment of wool-waste, the leaching of wood-ash, and Steffens water of beet-sugar manufacture, have contributed an acceptable, though comparatively small, tonnage of fertilizer potash. Other potential resources awaiting further development are the potash-bearing silicates, particularly the leucite rock (silicate of alumina and potash) of Wyoming, the greensands of New Jersey and elsewhere, and the potash-rich slates of Georgia, such as are found also in other parts of the country. The utilization of our vast reserves of these raw materials necessarily depends on the operation of processes sufficiently economical to allow of production in competition with potash from other and foreign sources.

As to the production capacity of our potash plants, classified according to sources of raw materials, the U. S. Geological Survey roughly estimates the same as follows:

| Sources | Available potash (K ₂ O), short tons |
|---------------------------|---|
| Natural brines: | |
| Nebraska lakes | 50,000 |
| Other sources | 28,000 |
| Alunite | 4,000 |
| Dust from cement-mills | 3,500 |
| Kelp | 5,500 |
| Molasses distillery-waste | 4,000 |
| Steffens waste-water | 3,000 |
| Wood-ashes | 1,000 |
| Other sources | 1,000 |
| Total | 100,000 |

This grand total corresponds to more than 40% of our normal consumption and gives an indication of the future expansive possibilities.

So much comment has been circulated in the past about the potassium and borax deposits at Searles Lake, California, that at this juncture it may not be inopportune to present a review of activities of the pioneer company operating in that field, together with photographs to illustrate various phases of the operations. Searles basin, flanked by the Argus and Slate ranges, is situated at an altitude of over 1600 ft. in the north-western corner of San Bernardino county, scarcely 50 miles from the famous Death Valley. The productive possibilities of Searles Lake—or Borax Flat, as this branch of the Mojave desert has often been termed—were first recognized by the late John W. Searles, who, after discovering the deposit in 1862, finally located on 2080 acres in February 1873. This deposit was profitably worked for many years by Searles, but when the price of borax receded to \$60 or \$70 per ton, he was obliged to dispose of his holdings in 1895 to the Pacific Coast Borax Co. It was not until the year 1912, however, that the importance of the potassium in the deposit was appreciated. Following exhaustive experiments confirming the potentiality of Searles Lake as an inexhaustible source of potash, the American Trona Corporation was organized in New York and floated in 1913 with an authorized capital of \$12,500,000. The Trona Railway Co. was then formed, all the capital stock being owned by the parent company, and a standard-gauge railroad of 30.7 miles was constructed from Searles, on the Southern Pacific Mojave-Owens line, to Trona, the company's headquarters on the lake. The buildings of the old company formed the nucleus of the American

Trona Corporation's experimental plant, and after many trying months of pioneer research a sufficiently promising process was evolved for the extraction of potash and other salts to justify the construction of the initial unit of the permanent concentrating plant, the completion and successful operation of which unit marked the entry of the American Trona Corporation into the field of production in November 1916. The close of that year witnessed the final attempt on the part of the Lee interests to forcibly dispossess the California Trona Company of its rightful claim-holdings. In the following year the State Supreme Court handed down its decision ratifying the company's property rights at the lake, thus bringing to a close the bitter contention which had waged for several years and which had been the subject of so many sensational newspaper reports. During the experimental stage and during the period of early construction the company further developed its resources of fresh water, and at the present writing has an ample supply assured for its future plant and domestic requirements. Horizontal beaches and shore markings over the more rocky portions of the surrounding mountain slopes present unquestionable evidence that in prehistoric times the level of the lake stood no less than 600 ft. higher than today, which explains the highly concentrated state of the present formation as being due to the process of solar evaporation through a long period of time. The area of Searles lake at its greatest expansion during past ages was about 385 square miles, including the extensions into the adjacent Salt Wells and Indian Wells valleys. The magnificent deposit of white crystalline salts now remaining is nearly 12 square miles in area and has a depth of between 60 and 100 ft. through the salt body to the lake's muddy bottom, having been estimated to contain a minimum of 4,000,000 tons of potash as well as larger quantities of borax and other salts. From any point over the expansive area of the so-called crystal body a shallow well can tap an inexhaustible supply of the mother-liquor, which entirely permeates the deposit. A representative analysis of this brine, having a specific gravity of 1.3 at 23° C., will show the following:

| | Per 1000 cc. Grammes | In original sample % |
|---|-------------------------|----------------------------|
| Insoluble in water | 262 | 20.15 |
| Sodium sulphate, anhydrous (Na ₂ SO ₄) | 71 | 5.48 |
| Sodium carbonate, anhydrous (Na ₂ CO ₃) | 60 | 4.62 |
| Sodium bicarbonate | trace | ... |
| Sodium baborate, anhydrous (Na ₂ B ₄ O ₇) | 17.2 | 1.32 |
| Potassium chloride | (*) | 4.50 |
| Total | | 36.05 |

*Quoted by Hoyt S. Gale in U. S. Geological Survey Bulletin No. 580, 'Salines in South-eastern California', as 36.9 gm. K₂O in 1000 cc. of original solution, or 5.84% KCL.

During pumping operations at the lake extending over two years but slight variations have been observed in the successive analyses. By comparison it is interesting to note that the salts contained in the Great Salt lake, in Utah, carry less than 2% potash, while the salts of Owens lake, in California, contain approximately 2.25% potash, according to E. E. Free in his Bulletin No. 54, entitled 'The Topographic Features of the Desert Basins of the United States with Reference to the Possible Occurrence

of Potash', issued by the U. S. Department of Agriculture.

One of the several important problems without precedent successfully solved by the American Trona Corporation was the efficient delivery of brine from the centre of the lake to the plant on its western shore, a distance of nearly four miles. A road-bed of imported local material and a narrow-gauge track were first built across the crystal body to the site of the pump-house, which was made of reinforced concrete and equipped with electrically driven centrifugal pumps and relays, each capable of throwing the heavy brine, which weighs 10½ lb. per gal., at the rate of 500 gal. per minute. With the drilling of a series of manifold suction-wells on laterals east and west of the pump-house and the construction of a 10-in. line to the concentrating plant, which pipe-lines were thoroughly insulated with hair and wool-felt covering, it has been possible to deliver the brine with the variation of but a degree or two and without precipitating the salts, even though the thermometer shade-readings fluctuate 100° throughout the year.

Mention should here be made of the 'reef' of trona ($\text{Na}_2\text{CO}_3 \cdot \text{NaHCO}_3 \cdot 2\text{H}_2\text{O}$) lying along the eastern and north-eastern shores of the lake and constituting certainly one of the most massive deposits of its character ever discovered. This reef of natural carbonate of soda is in the nature of a saline efflorescence, being composed of salts brought up with rising ground-water and deposited at the surface by evaporation. A considerable tonnage of this crude material has already been shipped out for various uses, including the manufacture of explosives. In addition to the minerals before-mentioned, the following are also to be found in the Searles Lake deposits—a veritable treasure-house of minerals—being arranged approximately in order of abundance: halite, mirabilite, thenardite, natron, gypsum, anhydrite, glauberite, hanksite, northupite, pirssonite, gaylussite, sulphohalite, tychite, and searlesite. Several other minerals have been said to be present, including celestite, cerargyrite, colemanite, dolomite, embolite, gold, nitre, and sulphur.

Dr. H. W. Morse, the company's technical executive, in a recent address before the members of the American Chemical Society at the Engineers' Club in San Francisco, spoke optimistically of the future. He claims that by further simplification of the process at Trona and the introduction of solar evaporation, the American Trona Corporation can successfully operate on pre-war prices. Production was speeded up to 2000 tons of K_2O per month. Borax, also occurring with potassium and other salts in solution in the brine of Searles lake, offers a promising source of revenue which the company plans to develop.

The Solvay Process Co. has also been successfully producing potash for some months past from its reduction works at Borosolvay, on the lake shore, two miles from Trona and served by the Trona railway. Elsewhere on Searles lake a number of new plants have been planned to operate the Government grants made under the potash-leasing law enacted October 2, 1917, the latest

in the field being the West End Consolidated Mining Co. of which the famous F. M. 'Borax' Smith is president.

It is not within the scope of this article to enter into further discussion on the many sources of American potash supply, but judging from the results so far attained during the past five years and the future possibilities, it is reasonable to believe that the United States has within its borders potassium salts in sundry forms sufficient for all future requirements. Nevertheless, if the 1913 importation of 270,000 tons of potash can be accepted as a criterion of America's normal minimum consumption, it is evident that our present internal sources of supply will, for some time to come, be inadequate to furnish the expected growing demand. It should be noted, also, that owing to the high cost of producing American potash, prices have necessarily maintained a high level. Liberal stocks continue on hand throughout the United States, naturally, because the consumer is marking time pending governmental action.

President Wilson, in replying from Paris recently to a request that action be taken to limit the importation of German potash into this country, advised Senator Hitchcock of Nebraska of his doubt that any restrictive measures could be made effective without further action by Congress, adding that potash was one of the commodities the Allies had already seen fit to permit Germany to export in payment for food. All the more opportune is the bill, which will have the support of the Departments of War and Agriculture, now pending for decision by Congress. This measure by Mr. Franklin K. Lane, the Secretary of the Interior, failed to be considered at the last session of the 65th Congress; it proposes to restrain the importation of foreign potash with the proviso that it only be used in certain fixed proportion with our own domestic product. Preparatory to the campaign in Congress, it is interesting to note that headquarters have been established at Washington by the U. S. Potash Producers' Association, recently organized in Denver under the presidency of Mr. Boyer of Salt Lake City.

Now, with the advent of peace, keen competition should be expected not only from France, but also from Germany again, where vast quantities of potash are ready for shipment. The problem therefore facing Congress is the determination of the policy necessary to be pursued for the proper protection of this vital industry of ours, in order that America may be enabled to further develop her own resources and finally become completely independent of foreign supply.

NEVER have labor conditions in Alaska been more unsettled than at present, not that there is a scarcity of men numerically but that many of them are not disposed to work. All the large quartz-mine operators are short of men—practical underground miners—and the output is greatly curtailed in consequence. The same may be said of the placer districts of the interior, except that there are at present but few laborers in the interior camps. As a result the mineral output of Alaska for the present year will not be much in excess of that during either of the war period seasons.

Roasting by the Huntington-Heberlein Process at Cockle Creek, N. S. W.

By W. J. JACKSON

*All ores containing more than 3% sulphur, together with all sands and other fine residues, are delivered to the roasting department. Those that are in a coarse condition are first sent to the crushing plant, consisting of 15 by 9-in. jaw-crushers and two No. 5 Krupp mills. The ore is here crushed through a quarter-inch screen. Any pyritic concentrate high in sulphur is given a preliminary roasting, to bring the sulphur content down to about 12%, and the roasted material is delivered to the H. H. charge-making bins. Here the various ores, sands, residues, roasted pyrite, together with about 12% of limestone, are made up into one-ton charges in hopper-trucks with bottom-discharge. The trucks are elevated by hydraulic lifts to a tramway running over the roasting-furnaces, and the contents are dropped into hoppers over each furnace, from whence the mixture is fed into the centre of each furnace by means of a Challenge ore-feeder.

A typical charge would contain:

| | % |
|------------------------|-----|
| Pb | 50 |
| SiO ₂ | 7 |
| FeO | 7.5 |
| CaO | 6 |
| MnO | 2.3 |
| ZnO | 10 |
| S | 15 |

The mixture is now given a roasting in a modified Godfrey furnace, which brings the sulphur content down to about 9.5%. This furnace is gas-fired, and consists of a rotating circular hearth, 21 ft. in diameter, supported on a wheel-race, and covered by a low dome-shaped roof. The charge, as already stated, is fed into the centre of the furnace through a hopper with a Challenge feed, and worked outward by blades attached to a fixed radial arm. At each revolution it is turned over and outward, the amount of deflection of the blades, which are adjustable, and the rate of rotation of the hearth determining the output of the furnace.

There are ten of these furnaces in two rows of five, each with an output of 30 tons per 24 hours. They are driven by a duplicate steam-engine of 18 hp. (which allows of great variation of speed) off two main shafts by belt-drives, each furnace requiring about 2½ hp. One man looks after four furnaces. The object of the roasting in these furnaces is not only to reduce the sulphur content down to about 9.5%, but also to agglomerate the fine particles so that the roasted material will be in a

granular condition, which form is most suitable for the subsequent treatment in the H. H. pots.

The gas for firing the roasters comes direct from the Mond gas-plant, and is led into the brick combustion-chamber of the furnaces through a gas-burner, which consists of a cast-iron box through which a number of air-pipes pass. The gas and air thus become mixed as they pass into the combustion-chamber. Fitted to the front of the box is a wrought-iron sliding plate, perforated with a number of holes coinciding with the air-pipes leading through the box. As the sliding plate is worked backward or forward it opens or closes the air-holes, thus regulating the supply of air to the combustion-chamber. The supply of gas is controlled by a gate-valve on top of the cast-iron box or burner.

The hot roasted ore is discharged at the periphery of the hearth into brick-lined boxes, which keep the material hot while sufficient is accumulating to fill one of the trucks, by which the roasted ore is conveyed to the H. H. pot-house. When sufficient ore has accumulated in the various boxes to make up a train-load, it is allowed to drop out of the hoppers into special side-tipping trucks, run on a 2-ft. gauge tram-line. These trucks are pushed out onto the main line, where they couple together automatically, and are hauled by a 5-ton electric locomotive up a 4% incline into the H. H. pot-house. This plant consists of 24 pots, each capable of holding 5 tons. The charge-floor is built up level with the top of the pots, which facilitates charging.

The H. H. pots are of cast-iron and of elliptical form, hung on hollow trunnions. About six inches from the bottom a perforated plate fits horizontally. This is held in position by four studs, which are fixed into the sides of the pot, and project about an inch over the top of the plate. The space under the plate acts as a wind-box. The air-blast passes through the hollow trunnion, down a pipe outside of the pot, and enters the wind-box. There is, therefore, no necessity for detaching and re-attaching the air pipe after each tipping of the pot.

A hood rests on the flanged edge of the pot, making a fairly close joint, which is made air-tight by a lute consisting of flue-dust and clay. It is provided with two small doors or inspection-holes, through which the charge is barred when blow-holes make their appearance. They are also fitted with a telescopic arrangement, which allows the hoods to be easily swung up during charging or tipping operations. The hot roasted ore is tipped direct into the pots. The charge is levelled, and an air-blast of from 10 to 12-oz. pressure is turned on. Thermo-chemical action takes place: the ore being desulphurized to a low

*From the Transactions of the Australasian Institute of Mining Engineers.

point, and the heat generated by the reaction is sufficient to fuse or sinter the mass, with the exception of a little fine on the top of the pot; this is returned to the raw mixture, and worked off in small amounts to each charge. It takes from six to eight hours to finish the operation. The pot is then turned over, and the sintered mass falls onto the breaking-floor beneath, where it is cooled by spraying with water, and broken up to six-inch lumps. One essential difference in the process to the general practice is that the charge, after roasting, is not wetted and cooled, but arrives at the H. H. pots at a dull-red heat. No fire is built in the pot, the heat retained by the ore being sufficient to start the reaction when the blast is turned on; whereby there is a considerable saving in fuel and labor.

The gas-pipes from the hoods connect with four main overhead pipes, two of which convey the gas suitable for acid-making to the acid-chambers. The other two are used for by-passing the unsuitable gases to two iron stacks, which discharge into the atmosphere. As the operation develops, it is expected that the whole of the gases will be used for acid-making, about 80% of the gases being serviceable for this purpose.

To one trunnion of each pot is fitted a wheel about four feet in diameter, which has a heavy toothed boss. These teeth engage with a pawl, which holds the pot in position while working. When it is ready to tip, the pawl is knocked out, a chain is passed round the wheel, and the pot pulled over by means of a two-ton block-and-tackle. The sintered mass, weighing about four tons, falls onto the breaking-floor, 10 ft. below. This floor, which stands about four feet above the surrounding level, has been built up by running in molten slag to a depth of six feet. The block has been covered with concrete, reinforced with 60-lb. railway irons laid side by side. These overhang by about one foot, and project just over the top of the side-tipping trucks, which stands on a line running each side of the breaking-floor. This, together with the fact that the floor has a slight fall to each side, enables the sintered product to be easily pushed into the charge-trucks. When full they are drawn away to the smelters by the five-ton electric locomotive already mentioned.

The blast for the H. H. pots is supplied through a 20-in. main from a Root blower, driven by a 60-hp. variable-speed motor, the actual power required being about 30 horse-power.

THROUGHOUT the recent disturbances in Mexico the American Smelting & Refining Co. was able to maintain four of its furnaces in operation at Chihuahua. This was possible through the existence of about a month's supply of ore in the bins. Mining as well as smelting operations have been kept up to some degree, but are expected soon to show an increase. An option was recently given an oil-driller who had visions of a flow on part of the acreage which the company owns at its El Paso smelting plant. The drilling was not finished within the time named in the option and it was not renewed. There have

been no evidences of oil on any of the 8000 acres of the American Smelting & Refining Co. in Texas, although some of the more enthusiastic men in the oil-drilling business have considered it logical that oil would be found. Further drilling may be done for company account.

Asphalt in 1917 and 1918

According to statistics compiled by the U. S. Geological Survey, the quantity of asphalt and allied substances produced in the United States in 1918 was 1,237,853 short tons, valued at \$18,540,032. Although the demand for imported native asphalt is still large, the relative abundance and adaptability of petroleum has reduced considerably the production of native bitumens and bituminous rock from domestic quarries. However, the increased price received by producers of domestic native bitumens more than offsets the decline in output. The quantity of petroleum asphalt (including road oil and flux) produced in 1918 from oil of domestic origin was 527,575 short tons, valued at \$7,435,204. The native bitumens and allied substances, including gilsonite, grahamite, elaterite, bituminous rock, and ozokerite produced from mines and quarries in the United States in 1918 was 60,034 short tons, valued at \$780,808. Asphalt is widely known and has long been extensively used in road construction, but in recent years many producers of asphalt and allied substances have successfully marketed their products for other uses. Including both native asphalt and asphalt made from petroleum, as well as gilsonite, grahamite, and elaterite, the uses in buildings and other structures are manifold. As they are elastic, antiseptic, acid-resistant, and moisture proof, these materials are being widely employed for use in flooring and roofing, in waterproof coating, and in electric insulation, as well as in the manufacture of varnish, paint, and putty. Although they have been marketed for relatively few years they are in general demand among contractors and engineers and their use is rapidly increasing. Gilsonite, the purest known hydro-carbon, has found great favor in the rubber industry. As pure rubber is sensitive to heat and cold it cannot be used advantageously for making products that are exposed to extreme temperatures, but when it is mixed with gilsonite and the mixture is vulcanized the rubber undergoes changes in composition that enable it to resist variations in temperature as well as oxidation. The product of this mixture, which is called mineral rubber, is well adapted to outdoor use, and the demand for it is increasing. Ozokerite, a native paraffin, is utilized in the manufacture of leather polish, sealing wax, electrotypers' wax, candles, electric insulation, carbon paper, and ink. The outlook for the domestic asphalt industry is considered encouraging.

ALL HEARINGS on the tariff bills covering war minerals have been postponed until September. This is the announcement of Chairman Fordney of the Ways and Means Committee to the American Mining Congress.

REVIEW OF MINING

ARIZONA

WAGE INCREASES AT BISBEE AND DOUGLAS.—SACRAMENTO HILL.

DOUGLAS.—The wage increase which became effective on July 23 in the Warren district and Douglas for employees of the Phelps Dodge Corporation, Copper Queen branch, and the Calumet & Arizona Mining Co., placed the Arizona copper miner on top of the heap so far as wages were concerned. Bisbee miners now draw \$6.10 per day of 8 hours, an increase of one dollar from the previous scale, which became effective last December. Timbermen and skilled mechanics also received the one dollar increase. Muckers in the mines of the Warren district were increased 75c. to \$5.60 per day. Mexican and other unskilled labor was increased 60c. per day. The smelters at Douglas had a similar increase, all men who had received \$4.25 or more during the period previous to July 15 receiving 75c. per day increase, the men who had received less than that figure being given a 60c. increase. Skilled mechanics received one dollar increase. All employees receiving a monthly salary were raised 15%. In announcing the wage increase Grant H. Dowell, manager of the Copper Queen branch, made it plain that skill would be recognized by higher wages and the 50-cent difference between miners and muckers would be maintained, no matter to what level wages rose. He also called attention to the fact that the increase was based upon 24-cent copper, and that if the price rose further wages also would increase in conformity to the sliding scale agreement. The former sliding scale was still in effect, he stated, but on account of the increased cost of living the 24-cent base for the increase was adopted. He mentioned the Butte district, where miners received a wage increase to \$5.75 per day and had agreed to maintain that figure for a year, and contrasted this with the Arizona plan whereby the employees of the companies in the Warren district, as well as those at Jerome, in the Globe-Miami district, and other large companies operating in the State, will profit by the anticipated rise in copper.

Calumet & Arizona is getting back upon something like a normal basis once more, as indicated by the June production of 4,142,000 lb. This was the best showing of any month since last October, was but 90,000 lb. less than the same month last year, and exceeded the May output by 294,000 lb. The kindred interests of the Calumet & Arizona reported a proportionate increase. New Cornelia reached 3,440,000 lb., or almost twice as much as had been made in the previous month, although

it lacked 72,000 lb. of reaching the figure attained during the previous year in June.

In connection with the work of starting production from Sacramento hill, the publicity department of the Copper Queen branch announced the following facts: The ore in Sacramento hill is of a variety new to the Warren district, being disseminated and lying in the intrusion of the porphyry between the Pinal schist on the north and the limestone on the south. There are two orebodies, separated by a strip of barren ground which, although it contains some copper, is too low grade to be worked at a profit. The west orebody contains 7,660,000 tons of ore assaying 2.2% copper. The east orebody lies under the peak of the hill about 300 ft. beneath the summit, and extends downward about 400 ft. farther. It is estimated to contain 14,000,000 tons of ore and is somewhat better adapted to both underground and open-pit mining than the west body. The hill, which extends 300 ft. above the 5360-ft. level, will be taken down in four benches. The three lower ones will be 60 ft. high, but the top one, although averaging 60 ft., will attain a maximum height of 120 ft. The benches will be opened from the south working toward the north rim of the pit, thus breaking the ground away from the line of the El Paso & Southwestern railroad and the Naco road, the most traveled highway in the Warren district. They will be attacked separately, starting at the top bench, which will be kept well in advance of the lower ones to prevent undermining. In order to reach the top bench $2\frac{3}{4}$ miles of trackage must be laid, most of it on a $2\frac{1}{2}\%$ grade with two switchbacks and a circuit of the hill to climb to the top. For a short time ground will be removed from all four benches and for a considerable time three benches will be working. Traffic during such times will be difficult. Trains from the upper level will join those from the lower ones and pass over the switch at the west end of the 5360-ft. level before distribution to the dumps. From 20 to 25 trains per hour, full or empty, must pass this point when operating at capacity. Before grading and laying tracks it was necessary to break down the ragged cliffs on the south side and establish a slope. Track grading on the north and east slopes of the hill had to be done with great care to avoid serious damage to property or loss of life as the hill is in the centre of a thickly populated section. Blasting had to be done most carefully and the entire work took twice as long as had been estimated. Safeguards were provided also for the men working on the hill. 'Bomb-proofs' in the form of conical steel houses were prepared

and the men compelled to retire to these when blasting. The ore in the hill differs greatly in copper content and several hundred thousand tons will be sent direct to the smelter. The ore is of a type favorable to concentration and is expected to give a high recovery.

CALIFORNIA

GRASS VALLEY AND SIERRA COUNTY.

GRASS VALLEY. The excavation for the new 20 stamps to be added to the Empire mill is well advanced and material is arriving each day. Milling has ceased at the Pennsylvania, which is a part of the Empire company, and upon completion of the latter mill the Pennsylvania mill will be dismantled. The mine is about to reach normal production following the serious setback that it received during the strike last June. The water is being rapidly lowered and work will be resumed on the lower levels as soon as they are drained.

The miners' strike came to an end officially on July 26, when the Mine Workers' Protective League voted to ratify the amended agreement by which the miners returned to work on June 30. Less than 15 voted against ratification out of a membership of 750. The important feature of the new agreement is the 10% bonus at the end of each 3 months of service and the privilege of temporarily quitting for a substantial reason at any time without loss of pay. No move has yet been made by the mine owners to carry out the free market and store features of the agreement, which the League members are expected to insist upon. Meetings are to be held hereafter weekly, at which times the matters of sick benefits, mutual insurance, and co-operation will be disposed of. The agreement runs until July 1, 1920, and may be suspended by either side upon notice. The paid membership of the League is about 750, with dues fixed at \$1 per month. The damage to the mines and expenses of raising the accumulated water on account of calling out the pumpmen and engineers is estimated to have cost the operators between \$25,000 and \$50,000.

SIERRA COUNTY.—L. H. Holley, a merchant of Sierra City and James F. Hunt of Downieville, formerly District Attorney of Sierra county, located some soda springs at Parker Flat with the intention of marketing the waters and making a resort out of the place. While analyses were being made an investigation revealed a quartz vein 15 feet across from which the water flowed. Six feet of the vein assayed \$6 and nine feet \$4 and the locators are now in a quandary as to whether the mining of the vein and consequent destruction of the springs would be more profitable than bottling the water.

ONTARIO

COBALT, PORCUPINE, MATACHEWAN, GOWGANDA.

COBALT.—Every silver mine in the Cobalt district is closed owing to a strike of the miners who walked out on July 23 to the number of about 2000. The strike had been threatened for several weeks, but action was postponed from time to time in the hope that a settlement

could be arrived at by the mediation of the Labor Department of the Federal government. Hon. Gideon D. Robertson, Minister of Labor, submitted several propositions to the mine managers with this end in view. He asked them to go to Ottawa for a conference with the executive of the union, and offered to appoint a Board of Conciliation, or a Royal Commission of Investigation. None of these plans was acceptable to the mine managers, who finally adhered to the position they have maintained throughout, that they could not recognize or deal with a union affiliated with the Western Federation of Miners. The miners were willing to accept the finding of a Commission and on the refusal of the employers to accept this suggestion the strike was called. The only serious point in dispute is the question of the recognition of the union, as, although other demands have been formulated by the miners, the difference between the terms asked for and those prevailing at the time of the strike is slight. The employers base their stand on the unsatisfactory experiences of the past in dealing with the Western Federation while the view entertained by the Minister of Labor is that during recent years the policy of the Western Federation has materially changed, and that the mine managers are not justified in judging the organization by the policy and leadership of ten years ago. The pumps of many of the mines have been taken out and the mines allowed to be flooded.

PORCUPINE.—The strikes at Cobalt and Kirkland Lake have relieved the labor situation at Porcupine, where there has lately been a considerable influx of labor. All danger of a strike appears to have been averted by the decision arrived at by a conference between mine managers and representatives of the miners. The Hollinger and the McIntyre companies have agreed to open stores with a view to reducing the price of goods at least 15%; the Hollinger, McIntyre, Dome, and Porcupine Crown will institute a free sick insurance benefit plan for their employees, and hospital accommodation will be provided. At a meeting of the mine-workers these plans were endorsed by a large majority vote.

The Hollinger will increase its plant by 40 stamps, a portion of the machinery being already on the ground. The present plant consists of 160 stamps and one ball-mill. This will increase the capacity to 3500 tons daily. The McIntyre is treating about 600 tons daily, the ore running \$10 per ton. Its shaft is now down 1300 ft., making it the deepest mine in the district. A 5% dividend, payable August 30, has been declared. At the Davidson the new shaft has reached the 575-ft. level, its objective being 700 ft., where the diamond-drill indicates better results than those of the upper levels. Good progress in development has been made at the Clifton, where 25 ft. of driving has been done on the first level on a high-grade vein showing gold.

MATACHEWAN.—There is great activity in this gold area and many new properties are being developed. Important discoveries have been made on the Matachewan Rand, where an orebody, which is thought to be a continuation of that on the Matachewan (formerly the

Otisse), has been encountered. A contract for 15,000 ft. of diamond-drilling has been placed. The Matachewan has reached in the shaft at 160 ft. a vein indicated by diamond-drilling and will start lateral work at that level. The Miller-Gentles syndicate is operating nine claims and has found ore of the same type as that of the Matachewan. Several promising veins have been uncovered on the sutherland claim.

GOWGANDA.—The Ontario government is building a macadamized road from Elk Lake to Gowganda, a dis-

per Lord, Castle Rock, Helena, Royal, and Waterfall, which are situated on the south side of Beaver river, six miles from the terminus of the Portland Canal Short Line. Three mineralized belts have been explored on the property; these are known, respectively, as the Blue vein, the White vein, and the Green vein. The Blue vein is a 50-ft. belt comprising three veins aggregating 10 ft. of ore, which gives an average of \$4 in gold and 3% copper. The White vein measures from 4 to 6 ft., and has been traced for 2000 ft. It has been explored

MAP SHOWING THE LOCATION OF THE PRINCIPAL MINING CENTRES IN ONTARIO

tance of 27 miles, on which provision is made for an electric car line. This will stimulate development here, as one of the greatest drawbacks has been transportation troubles.

BRITISH COLUMBIA

GENERAL NEWS OF PORTLAND CANAL.

PORTLAND CANAL. The George copper mines in the Beaver River section of the Portland Canal Division have been bonded to the American Smelting & Refining Co. The George mines consist of ten claims: Mamie, Bessie, Gold Crown, Copper King, Copper Queen, Cop-

per Lord, Castle Rock, Helena, Royal, and Waterfall, which are situated on the south side of Beaver river, six miles from the terminus of the Portland Canal Short Line. Three mineralized belts have been explored on the property; these are known, respectively, as the Blue vein, the White vein, and the Green vein. The Blue vein is a 50-ft. belt comprising three veins aggregating 10 ft. of ore, which gives an average of \$4 in gold and 3% copper. The White vein measures from 4 to 6 ft., and has been traced for 2000 ft. It has been explored

The miners of the Portland Canal district will send to the Prince Rupert fair an exhibit of minerals, which,

after the close of the fair, will be turned into a permanent display in that city under the management of the Free Miners League. A strike of rich silver ore, carrying native metal and argentite, has been made at the Big Missouri, which is under option to Sir Donald Mann. The Hon. W. Sloan, Minister of Mines, who has recently returned from a visit to the mine, has announced that the provincial government will continue the road up to the Big Missouri, in order to facilitate ore shipments this winter. A survey has been completed recently for a railway from Steward, at the head of the Portland canal, up the Salmon River valley, and when the road is completed it will be a great boon to the many mines in this district. The railroad from Alice arm to the Dolly Varden mine has been finished. The loading-chutes at the Tallor Mining Co.'s wharf are finished, and it is expected that ore shipments will start at once. The Blue Bell mine, in the Ainsworth section, is being unwatered by a new 1000-gallon pump. A heavy flow of water caused a cessation of underground operations last year, but some 5000 tons of oxidized lead and zinc ore was shipped from surface operations.

MEXICO

MINE SUPERINTENDENT MURDERED.—NEWS OF THE LOUISE MINE.

ZACATECAS.—Theodore Patterson, a British subject and superintendent of the important group of mines owned and operated by the Mazapil Copper Co. at Aranzazú, State of Zacatecas, was murdered under circumstances of peculiar brutality by a mob of miners in the employ of the company. The crime, which was committed with cold-blooded ferocity, was undoubtedly premeditated and executed in accordance with pre-arranged plans. The facts are as follows: At about 8 o'clock on the morning of July 18, Patterson was on the mine *patio* attending to his usual duties; without any warning, he was set upon by a mob of about 200 men, who had as it seems been waiting for him to appear. Realizing the peril of his position, Patterson attempted for a time to stand them off, but seeing that they were entirely out of hand and that all arguments were useless he then tried to escape from them and ran for his life. He was then fired upon by the crowd, who were in full pursuit, and was struck by a rifle-bullet, which passed through his body. Although mortally wounded, Patterson managed to crawl into a hut that happened to be occupied by some women, who, instead of extending any assistance to the now dying man, immediately fled, abandoning him to the mercies of the rabble. Seeing Patterson helpless and in his death agony, they showed their respect for the elementary laws of humanity by throwing several dynamite bombs at him, and then, satisfied with their work and having no fear of consequences where a mere foreigner was concerned, they fell upon the body and literally hacked it to pieces with their knives. All this occurred in full view of several hundred people, including members of the police, none of whom attempted to inter-

fere in any way or to render the victim the slightest assistance.

The above is only another instance of the chaotic conditions prevailing in Mexico. This is principally due to the supine and often frankly hostile attitude assumed toward foreigners by the powers that be, and also in great measure to the unaccountable indifference manifested by foreign governments where the welfare of their nationals resident in Mexico is concerned. Hatred and contempt of, and outrages on, foreigners are of daily occurrence, the Mexicans being fully persuaded by this time that no account will be required of them, and that no effective steps will be taken to put an end to conditions which are a disgrace to this continent in particular and to civilization in general. It is noteworthy and extremely significant that not one word concerning the above outrage appeared in the local press, but this is the rule and not the exception where attacks on foreigners are concerned. On the other hand, a grotesque distortion of the facts appeared in one of the Mexico City dailies.

SONORA.—The Louise Mining company, at Buenavista, Sonora, now employs about 100 men and has developed a considerable body of lead-silver ore. The main shaft is down 300 ft. and driving operations on the 300-ft. level are under way. A 50-ton flotation mill has just been completed and will be put in operation about September 1. Several years' supply of ore has been blocked out underground. Headquarters of the company are, at Charleston, West Virginia. H. J. Wendler of Los Angeles is general manager.

QUEBEC

THE CHROME SITUATION.

An unexpected and sudden demand for chrome has come to the Quebec district, an important source of chrome during the War and a producer in small amounts for several years before. After the Armistice the demand ceased and the outlook for chrome mining was bad indeed. An effort was made to secure connections in Great Britain, but the uncertainty as to freight-rates deferred satisfactory contracts. Recently American buyers have been in evidence and contracts have been closed at good prices. One contract for 2000 tons is reported at 70c. per unit for 30% chrome oxide minimum and an offer of 85c. is reported. The buyers are the big steel companies of the United States. It is rumored that the United States Steel Corporation has taken an option on the holdings of the Black Lake Chrome & Asbestos Co. for \$1,000,000. These include more than 800 acres on Caribou lake, east of Black Lake station on the Quebec Central railroad. Recent developments on the adjoining property of the Mutual Chemical Co. of New York have shown an orebody with the best grade of chrome ore yet found at 200 ft. in depth. Another new chrome development is under way on the Ross lot about a mile west of Black Lake station. The Quebec chrome runs from 30% up to 50% for shipping grades. The minimum shipping grade is 30%. The lower grade ore is milled.

THE MINING SUMMARY

ALASKA

Valdez.—The stampede to the newly discovered platinum fields, eight miles out of town, continues unabated. Several new discoveries have been made in other localities some of which are reported to be richer than those first reported. Men have been dropping out of town by fives and tens, staking promising ground, and prospecting other localities for the precious metals. Assays received from the first shipment, from five pans of dirt, from the supposed platinum deposits, brought \$8 in gold and \$247 in platinum.

ARIZONA

Mayer.—The new wagon-road from the mine of the Franco-American Copper Co. is nearing completion. The re-timbering of the old shaft has been finished and sinking below the 300-ft. level is to be resumed. Preparations are being made to ship 1500 tons of 20% copper ore now on the dump.

Miami.—The 35-ton copper-leaching plant of the Inspiration Copper Co. has been completed and is operating. This plant is an experimental plant intended to work out a commercial method of treatment for the large tonnage available of carbonate and silica ores of copper.

Superior.—The 1800-ft. tunnel of the Magma Copper Co., which is now in 75 ft., is progressing at the rate of 5 ft. per day. This tunnel, which is to connect with the mine workings at the 500-ft. level, is 12 by 12 ft. It is to be concreted throughout and when completed will be the main haulage tunnel for ore and underground supplies.

Tucson.—The regular bi-monthly meeting of the Arizona Chapter of the American Mining Congress was held in Tucson last week, at which it was said the question of increase in wages was discussed in view of the increase in the price of copper. The meeting was an informal one, and was attended by all the large operators of the State.

Yavapai County.—The Arizona State Tax Commission has assessed the value of all mining property being operated in the State of Arizona for the year 1918 at \$416,080,482, which compares with the assessed valuation for 1919 of \$417,704,615, showing an increase for the year 1919 of \$1,624,133. The County Assessors of Arizona have placed upon other operative property of the mining companies \$57,593,276 as compared with \$51,861,191 in 1918. On non-productive property owned by mining companies, such as town-sites, buildings, stores, supply-houses, and other classes of property, owned by the mines but not actually productive, the assessment for the year is \$7,916,633. The grand total of the assessments of the producing mines, reached the enormous total of \$483,184,526, or more than one-half the assessed valuation of all the property in the State. Of this valuation the United Verde Copper Co., at Jerome, in the Verde district of Yavapai county, comes third with a valuation of \$50,273,788. By counties, the largest valuation of mining property goes to Gila; second, to Cochise; and third, to Yavapai.

CALIFORNIA

Downieville.—Development of the City of Six property is progressing vigorously under the management of A. E.

Hodgkinson, representing Los Angeles capital. Good ore has been opened in a new section of the ground, and the owners have arranged for a comprehensive campaign of development until winter sets in.

Dutch Flat.—The Bear Barite Co., under the management of B. C. Van Emon, on the Lowell Hill Ridge, is working several men and preparing for development on an extensive scale. Samples of the ore sent to San Francisco have assayed well. William Patrick of Dutch Flat has been given the contract for hauling the ore to the Southern Pacific railroad, a distance of seven miles.

Graniteville.—W. L. Baker has a force of men employed at his quartz property on the northern rim of this place. A drift is being driven from the bottom of the 100-ft. shaft to intersect the vein, which is expected to be reached soon. Baker has a number of railroad employees associated with him in exploring the mine. There is a five-stamp mill on the property, together with a new hoisting and pumping plant.

Knob.—The Victor Power & Mining Co. has taken over the bond given by E. P. Conner & Son on their Bull Moose mine, which closely adjoins the claims of the Victor. Two Gibson mills are kept running on ore from the Bull Moose and the Victor mines.

Oroville.—Preliminary work has started at the Indian Springs gravel mine, in the Magalia district. Los Angeles capitalists, represented by J. Woodruff, have acquired control of the old producer, which has yielded approximately \$4,000,000 in gold. The adjoining Hupp property has been taken under lease and option, and it is planned to operate both mines through the main working tunnel of the Indian Springs, which is 4000 ft. long.

Placerville.—The Ohio deep gravel mine, which has been worked in a crude manner intermittently for the past sixty years, is to be operated by modern methods. B. Soderhjelm has taken over the property under bond, and will install modern machinery operated by electric power. Heretofore the gravel from the mine was reduced by washing in sluice-boxes, and only part of the free gold was recovered. Much of the gold was washed away and lost in the tailing.

The mine covers an area of 60 acres in the White Rock district, 2½ miles north-east of Placerville.

Sierra City.—There is considerable of a revival in mining in this district, and indications for the future are promising. A. D. Walker of Portland, Oregon, has been visiting the One Thousand One gravel mine, and is well pleased with the conditions. A drift is being driven to tap the gravel channel, under the direction of H. G. Coffin, the superintendent.

Sierra County.—John Costa is re-timbering tunnel No. 4 on the White Bear gravel claim with a small crew where he expects gravel may be found in raising. It was at first thought that a new tunnel would be necessary to be run at a much lower point than present workings on account of a break in the channel and now tunnel No. 4 will be tried out before new work is attempted.

Yreka.—The Roxbury Mining Co. of Scott Bar, composed of Boston capital, has made application to the State Water Commission for a water right of 60 cu. ft. per second from

Canyon creek and 65 ft. per second from Kelsey creek for mining purposes. They now are getting water from the Tom Martin and Muck-a-Muck creeks, near Scott Bar, but these creeks furnish only enough water to run a two and three-inch giant for about four months each year.

COLORADO

Georgetown.—Incorporators for the Georgetown district of the Sixth State Exploration company, the Georgetown branch of the State Mines Development Association, include the following: J. H. Robeson, H. S. Bushnell, H. W. Kirby, George B. McFadden, J. A. Noone, G. L. Cole, John Tomay, J. J. White, J. B. Foley, and R. G. Hoffman. Meetings have been planned for Silver Plume, Empire, and Lawson to bring the local association to the highest possible membership. The committee last week was successful in securing many new members, every one who felt able readily subscribing for the shares.

Kokomo.—The Queen of the West group of patented claims, located on Jacque mountain in the Ten Mile mining district of Summit county, near Kokomo, has recently been examined for Chicago and New York investors holding an option on the property, and the purchase of the group is now understood to be under favorable consideration.

Montezuma.—Articles of incorporation of the Montezuma Consolidated Silver Mines Co. have been filed for record with the county clerk and recorder. The directors for the fiscal year are Joseph Giediartz, Fred C. Ewing, Clarence A. Brandenburg, John F. Haggerty, W. F. Galbraith, V. C. Miller, and M. Winter. The main office of the company will be maintained at Montezuma, Summit county, Colorado.

Rico.—The Silver Gulch Mining & Milling Co. has a force of men at work excavating for foundations for the milling plant to be constructed to treat ores from the Rosebud mine and dump. A saw-mill to cut lumber for mill construction will be removed from Dunton and erected at the mine. The company is mining high-grade silver ore at the Rosebud and a small consignment of the high grade was loaded out during the past week.—The Marmatite Mining company resumed work last week on the Pro Patria, driving on the Enterprise vein and carrying a raise to the contact where a rich ore-shoot is expected. The company has also a lease on the tram and mill, and both will shortly be in operation.

IDAHO

Coeur d'Alene.—Operations are expected to be in full blast at the Consolidated Interstate-Callahan mine soon. Miners are being put to work as fast as they apply for employment, and word has been sent out to former employees to report as soon as possible and that their old positions will be held for them. The property has been closed for several months owing to the adverse metal market and the shortage of miners. The Consolidated Interstate-Callahan Mining Co. in the last four years has become one of the largest producers of zinc in this country. In this period it has shipped 215,680,459 lb. of zinc, 52,673,430 lb. of lead, and 949,980 oz. of silver, with a combined value of \$11,461,364.—The first demonstration of union miners in the Coeur d'Alene in 20 years took place at Wallace on July 27, when 800 mine employees from Wardner-Kellogg, Mullan, Burke, Mace, Gem, and Nine-Mile district paraded the streets and gathered in the city park, where they were addressed by E. W. Muir, State organizer for the American Federation of Labor, and J. O'Neill, said to have formerly published a radical labor paper in Denver, Colorado.—With the completion of the Nabob mill on Pine creek, and a report that the management expects to find the lost Stewart vein in the old Stewart workings, considerable interest is manifest in Kellogg in the operations of the Stewart company, which controls the Nabob. One of the directors who has just returned to New York after an inspection of the

properties, reports the 150-ton mill at the Nabob ready for its first performance, and that it probably will turn out its first tonnage before August 1. This director estimates a profit of \$1000 per day from the lead and silver contents of the Denver-Nabob ore.

MONTANA

Anaconda.—The Cottrell process for fume precipitation at the Washoe smelter has been in operation several days and is proving effective. It is the opinion of the company chemists that no injurious matter is now escaping from the big stack. The dust recovered is of high value.

Butte.—All of the local unions with the exception of the Metal Trades and allied unions have voted to accept the wage-scale recently presented by the companies, and all men employed at this time and belonging to the unions which accepted the wage-scale will receive the increased wages. The Metal Trades and allied unions will not receive the increase at this time. The new wage-scale is as follows: Boiler cleaners, \$6; boiler-cleaner helpers, \$5.50; cable repairers, \$6; cable repairer boss, \$6.50; carpenters, \$6.50; carpenter boss, \$7; sawyers, \$6; sawyer helpers, \$5.50; compressor men, \$6.50; diamond-drill runners, \$6.25; diamond-drill runners' helpers, \$5.75; engineers, first motion, \$7; engineers, geared, \$6.50; firemen, \$6; ash wheelers, \$5.50; laborers, \$5; laborer boss, \$5.50; change-house men, \$4.50; masons, \$8; mason helpers, \$5.50; miners, all underground men engaged in mining, \$5.75; miners, in shafts, station cutting, and winzes, \$6.25; drivers, locomotive surface, \$5.50; oilers, regular, \$5; oilers, second-class license, \$5.50; pumpmen, \$6.50; pipemen, underground, \$6.25; painters, \$6.50; painter boss, \$7; station tenders, \$6.25; teamsters and stablemen, \$5.25; tool men, \$5.75; watchmen, \$4.50; structural iron workers, \$6.50; structural iron worker, boss, \$7; shift-bosses, \$7.25; time-keepers, per month, \$165; foreman's clerks, per month, \$165; electrician helpers (not apprentice), \$5.50.—Options to purchase the Mary Louise and the Otisco claims, situated just south of the Davis-Daly Copper Co.'s holdings, have been secured by the Hayden-Stone interests. In addition to the Mary Louise and the Otisco options on the Syndicate fraction, amounting to four acres, the Railroad lode of 8½ acres has been secured. Negotiations are also in progress to secure an option or to control the stock of the Consolidated Central Copper Co. and the Alliance Copper Co. All told the Hayden-Stone interests have succeeded in securing options or controlling interests on nearly 200 acres in this district. Work has already been started.

NEVADA

Austin.—Ore has been opened in the main working tunnel of the Austin Nevada Consolidated mine. The product runs high in silver with the vein over 20 ft. wide. H. G. Richardson, the president, states that 75 distinct orebodies have been proved to extend into the property, including extensions of many of the great orebodies that produced upward of \$50,000,000 in the adjoining Manhattan group over thirty years ago.—High-grade ore is under development in the property recently acquired by Emmet D. Boyle and his associates. The mine adjoins the Austin Nevada Consolidated on the north, and the sinking of a working shaft is making good progress. The discovery opens to mining a new part of the famous Reese River field.

Divide.—The shaft of the Victory Divide has reached a depth of 200 ft. The last 70 ft. was sunk in two weeks with two shifts and the management claims a record for the district for Bob Wilson, superintendent. A sump will now be made, a station cut, and cross-cutting started toward the junction of the main Tonopah Divide vein and the east-dipping north vein.—Reports from the Rosetta Divide are to the effect that there is a splendid showing on that

property. The main shaft now has a depth of approximately 300 ft., and for the last 20 ft. a favorable body of ore has been followed on the foot-wall side of the workings, assays averaging \$22 per ton in gold and silver being reported. As soon as a station has been cut driving will be started to prove the vein. The company has been plodding along for a long period, having been one of the first corporations to enter the district during the early part of this year, and the fact that the property gives promise of soon becoming a shipper will prove good news to all interested in the district.

Ely.—All mechanical departments and operating employees of the Consolidated Copper Co. and Nevada Northern Railway Co., with few exceptions, are on strike, following the companies refusal of a demand by the men for restoration of the pre-armistice wage scale. This would mean an increase of \$1 per day, while the companies posted a wage increase of 75c. per day. The situation, although serious, is not hopeless and there has been no attempt on the part of interested parties toward aggressive tactics. The trainmen have submitted a revised scale of wages and are not now on strike. The main line passenger train between Ely and Cobre is moving and the camp is quiet and orderly.

Eureka.—Officials of the Eureka-Croesus Mining company report that at a depth of about 900 ft. the company has opened a body of high-grade ore 27 by 22 ft. Samples of the ore have assayed \$150 per ton, and the entire ore mass runs from \$65 to \$80. Several 50-ton shipments to the smelter of the mine run of this ore brought an average of \$62 per ton. The orebody is rapidly increasing in size as depth is gained.

Kimberly.—Kimberly has been selected as the site for the projected smelting plant of the Consolidated Copper-mines company. The plant will have a concentrating department capable of treating 2000 tons of porphyritic ore and 150 tons of sulphide ore daily, and reverberatory furnaces capable of treating all concentrates and 150 tons of oxidized ore per day. The crushing plant is to have a capacity of 3000 tons per eight hours. To operate the various plants and mine equipment an electric power unit capable of generating 3000 kilowatts is to be installed.

Tule Canyon.—A. L. Borcharding, manager for the association of Goldfield men who have taken over the Benton-Radford-Smith placer claims at the upper end of Tule canyon, states that he has opened \$6 gravel seven feet from bedrock in the inclined shaft that was started from the side of the canyon a short time ago. The 'pay dirt' was found at a vertical depth of 20 ft.—The cross-cut of the Goldfield-Tule Canyon Placer Mining Co. has been driven 75 ft. from the shaft.

BRITISH COLUMBIA

Trail.—The following statement gives the ore received at the Trail smelter during the week ending July 21:

| Mine and location | Gross tons |
|--------------------------------|------------|
| Center Star, Rossland | 1,120 |
| Cork-Provine, Zwicky | 36 |
| Emma, Coltern | 167 |
| Iron Mask, Kamloops | 44 |
| Josie, Rossland | 78 |
| Mandy, The Pas | 284 |
| Molly Gibson, Kettle Landing | 89 |
| North Star, Kimberley | 289 |
| North Star, Greenwood | 2 |
| Rambler, Three Forks | 66 |
| Silver Bell, Adamant | 35 |
| San Poil, Republic, Washington | 183 |
| Sullivan (zinc), Kimberley | 3,942 |
| Sullivan (lead), Kimberley | 284 |
| Total | 6,619 |

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Albert Burch is at Butte.

Richard A. Parker is in New York.

Charles W. Merrill is at Lake Tahoe.

W. de L. Benedict is here from New York.

E. Cushing Moore has opened an office at Spokane.

R. S. Webber, of Haze, Nevada, is in San Francisco.

Forbes Rickard has returned from Chicago to Denver.

Jackson A. Pearce has changed his residence from Berkeley to Los Angeles.

L. D. Ricketts is in Montana, on his way to the National Park, where he will do a little fishing.

William A. Shinkins, Lieutenant in the A. E. F., has returned from France to San Francisco.

Myron A. Folsom, who has been engaged in oil mining in Texas, is in San Francisco this week.

James Underhill has been appointed Associate Professor of Mining in the Colorado School of Mines.

S. J. Truscott succeeds William Frecheville as Professor of Mining in the Royal School of Mines, London.

S. F. Shaw has returned to Charcas from an inspection of the Bonanza property at Mazapil, in Zacatecas, Mexico.

John T. Reid has returned to Lovelock, Nevada, from north-eastern Oregon; he will leave for New York in October.

George W. Evans, having resigned as District Mining Engineer for the U. S. Bureau of Mines, has resumed consulting practice as coal engineer at Seattle.

M. Q. Moffitt, formerly mill-superintendent for the Mexican Candelaria Mines, is now in the sales department of the Taylor Wharton Iron & Steel Co., Chicago.

R. R. Shafter, after two years as general superintendent of the shipyard of the Traylor Shipbuilding Corporation, has returned to the Traylor Engineering & Manufacturing Co. as district manager of its New York office.

Engineering and mining men throughout the country will be interested in the reorganization plans of the Bureau of Mines just announced. Dr. F. G. Cottrell, chief metallurgist of the Bureau, who became a national figure through the invention of the Cottrell process for utilizing smelter fume by extraction of arsenic and various other commercial chemicals from the escaping noxious gases, has been named Assistant Director in charge of all investigative and scientific work. F. J. Bailey, for years Chief Clerk of the Bureau, becomes assistant to Director Manning in charge of executive work. J. E. Spurr, who at the outbreak of war became Director of War Minerals Investigations, and after passage of the War Minerals Relief Bill was appointed chief of investigative work in connection with relief claims, has resigned to become editor of the 'Engineering & Mining Journal' of New York. No successor to Mr. Spurr has been appointed. H. E. Meyer, Chief Clerk of the War Minerals Relief Commission, has been appointed Chief Clerk of the Bureau of Mines, and C. P. Robertson succeeds Mr. Meyer.

F. H. Evans, manager of the Sulphide Corporation's smelter at Cockle Creek, New South Wales, died of pneumonia, following influenza, on June 22.

Book Reviews

Mineral Deposits. Second edition, revised, enlarged, and entirely re-set. By Waldemar Lindgren. Pp. 957 + xviii. McGraw-Hill Book Co., Inc., New York. For sale by 'Mining and Scientific Press'. Price, \$5.

This second edition of Professor Lindgren's well-known book is a worthy attempt to bring his readers up to date on some of the new facts and theories that have accumulated so rapidly during the last six years on the subject of minerals and mineral deposits. Among the most important of these are the investigations on magmatic and contact-metamorphic ore deposits; problems of oxidation and supergene sulphides; and the application of metallographic methods to ores, by which their study has been facilitated and valuable light thrown on the complexity of metallic replacements. All the chapters of the book have been revised, and those on deposition of minerals, contact-metamorphism, oxidation, and sulphide enrichment have been largely rewritten. A discussion of metallogenetic epochs has been added, as well as an index by elements, which will enable the student to co-ordinate rapidly the deposits of any given metal. The genetic arrangement of the first edition has been followed. For the benefit of those unfamiliar with the first edition, it may be stated that the general plan has been to select a few suitable examples to illustrate each genetic group, the examples being chosen regardless of their geographic distribution. As can be seen from the appended chapter-headings the book covers the field thoroughly. In the introduction are given, where they are convenient for reference, certain elementary definitions and facts, together with a brief statement of the discoveries of early investigators. Having thus started square with his reader, the author takes up the various laws that influence the formation of minerals, the flow and composition of underground waters in different rocks and soils, and their effects on metamorphism and replacement. We are glad to see that structural geology is treated adequately and clearly, aided by numerous excellent diagrams. Many books on ore-genesis neglect this branch of geology, assuming that the reader will be sufficiently well acquainted with it; and yet it is precisely details of this kind that interest the mining engineer and enable him to grasp the otherwise academic conclusions of the professor and apply them to the solution of his mining problems. For similar reasons we would have liked a little more space devoted to the persistence of ore in depth. On page 147 the author starts the study of mineral deposits proper, and carries the reader through a thorough exposition of the principal types. The bibliography is exceptionally complete, but instead of being segregated at the end of the volume or after each chapter, the references are in the form of foot-notes scattered through the book where most relevant, thus facilitating reference. We commend this book to students, geologists, and mining engineers; in fact, to all who are interested in a skillful and thorough presentation of the subject. The chapter-headings follow: I, Introduction; II, The Formation of Minerals; III, The Flow of Underground Water; IV, The Composition of Underground Waters; V, The Chemical Work of Underground Water; VI, The Origin of Underground Water and Its Dissolved Substances; VII, The Spring Deposits at the Surface; VIII, Relations of Mineral Deposits to Mineral Springs; IX, Folding and Faulting; X, Openings in Rocks; XI, The Form and Structure of Mineral Deposits; XII, The Texture of Mineral Deposits; XIII, Ore-Shoots; XIV, The Classification of Mineral Deposits; XV, Deposits Formed by Mechanical Processes of Transportation and Concentration; Detrital Deposits; XVI, Deposits Produced by Chemical Processes of Concentration in Bodies of Surface Water by Reactions Between Solutions; XVII, Deposits Formed by

Evaporation of Bodies of Surface Waters; XVIII, Mineral Deposits Resulting From Processes of Rock Decay and Weathering; XIX, The Hematite Deposits of the Lake Superior Region; XX, Deposits Formed by Concentration of Substances, Contained in the Surrounding Rocks, by Means of Circulating Waters; XXI, Deposits Resulting from Regional Metamorphism; XXII, Deposits of Native Copper with Zeolites in Basic Lavas; XXIII, Lead and Zinc Deposits in Sedimentary Rocks; Origin Independent of Igneous Activity; XXIV, Metalliferous Deposits Formed Near the Surface by Ascending Thermal Waters and in Genetic Connection with Igneous Rocks; XXV, Metalliferous Deposits Formed at Intermediate Depths by Ascending Thermal Waters and in Genetic Connection with Intrusive Rocks; XXVI, Veins and Replacement Deposits Formed at High Temperature and Pressure and in Genetic Connection with Intrusive Rocks; XXVII, Deposits Formed by Processes of Igneous Metamorphism; XXVIII, Mineral Deposits of the Pegmatite Dikes; XXIX, Mineral Deposits Formed by Concentration in Molten Magmas; XXX, Metamorphosed Deposits; XXXI, Oxidation of Metallic Ores; XXXII, Metallogenetic Epochs. It remains to add that the book is written with all the lucidity and attractiveness of style that we are accustomed to expect from Professor Lindgren.

Metal Worker's Handy Book of Receipts and Processes. By William T. Brannet. Pp. 550. Ill., index. Henry Carey Baird & Co., Inc., New York. For sale by 'Mining and Scientific Press'. Price, \$3.

The wide scope of this remarkable collection of data can best be judged from the chapter-headings, which are as follows: Chemical Relations of the Metals; Metallic Preparations and Chemicals Used in the Metal Industry; Determination of the Constituents of Metallic Alloys; Alloys and Amalgams; Annealing, Hardening, and Tempering; Bronzing and Coloring; Casting and Founding; Cements; Cleansing, Grinding, Pickling, and Polishing; Decorating, Enameling, Etching, and Engraving; Electro-Plating; Brassing; Coppering; Galvanizing, Gilding, Etc.; Fluxes and Lutes; Lacquers, Paints, and Varnishes; Soldering and Solders; Welding and Welding Compounds; Wire; Flame Welding and Cutting; Thermit Welding; Electric Welding; Galvanizing and Sherardizing; Die Castings. The chapter on Alloys and Amalgams, for instance, contains receipts for more than one hundred distinct alloys, and the chapters discussing processes are equally exhaustive. As is important in a book of this kind, the index is ample, comprising more than thirty pages, and is well arranged. With such a wide field and such a comparatively small book, discussion of theory is wisely omitted as well as any other matter of text-book rather than reference-book character. Furthermore, there is no one with such wide interests as to find all of the book of direct value to him. Nevertheless, the book will be worth while to almost anyone engaged in practical work in one or more of the fields of activity indicated by the chapter-headings.

Abrasives and Abrasive Wheels. By Fred B. Jacobs. Pp. 321, ill., index. Norman W. Henley Publishing Co., New York. For sale by 'Mining and Scientific Press'. Price, \$3.

The growing importance of grinding and grinding-wheels alone warrants the publication of an up-to-date book dealing with the subject of abrasives and their uses. The present volume opens with a discussion of natural and artificial abrasives, and then considers the manufacture, testing, and operation of grinding-wheels and grindstones, including a discussion of dust-collecting systems and safeguards. Chapters are also devoted to surface grinding, cylindrical grinding, internal grinding, and special grinding operations, as well as cutter sharpening and saw sharpening. The book is well illustrated.

THE METAL MARKET

METAL PRICES

San Francisco, August 3

| | |
|--|-------------|
| Aluminum-dust, cents per pound..... | 50-60 |
| Antimony, cents per pound..... | 9.50 |

| Spelter, cents per pound..... | 9.50 |
| Zinc-dust, cents per pound..... | 11.00-13.50 |

EASTERN METAL MARKET

(By wire from New York)

Aug. 5.—Copper is quiet and easier. Lead is slightly weaker under outside offerings. Zinc advances abruptly and is strong.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 16, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 48.66 pence per ounce (925 fine), calculated at the normal rate of exchange.

In stating in advices emanating from Washington that "there is considerable quiet interest in Congressional and business circles as to the future price of silver," the "Wall Street Journal" of July 22 had the following to say:

Western interests are favoring additional legislation which will raise the limit below which the price of silver may not go. Director of the Mint Baker has just returned from an extended visit through the West. He finds this sentiment growing. As a rule it does not find favor in Administration circles, but Director Baker himself is non-committal on the subject. On the other hand, Senator Pittman (Nevada), who has taken an active interest in all silver legislation since he came to the Senate, is very frank in his position. "I believe in letting well enough alone," said Senator Pittman, when asked about prospective silver legislation. "The situation with regard to silver is very satisfactory since the passage of the Pittman Act, fixing the price at not less than \$1 an ounce. Of course, there is a great demand, and some of my friends in the West have been enthusiastically talking about the possibility of \$1.50 an ounce. I have advised them, however, that I did not think it would go beyond \$1.15. England is not buying silver above \$1.10, and any higher price than that would probably have a disturbing influence on the rupee. It should be remembered that prior to the War 30,000,000 oz. of silver went into the arts every year. The limitation on such use of the metal created a shortage in the arts of an easy 75,000,000 oz., and it is my opinion that the increasing demand for silver in the market now is due to a desire to meet that shortage."

FOREIGN EXCHANGE

Sterling has been steadier without much change for the week; francs are somewhat better; lire still decline. Banking attention still continues focused on our trade and financial relations with Europe, of which one of the vital factors is foreign exchange. With exports for June totaling \$918,000,000 it is evident that the problem is of proportions to warrant concerted action. Practically all European nations have been sounding the American money market as to what credits they can obtain. Bankers are accommodating them as rapidly as possible, the total for a recent week being estimated at \$300,000,000. The latest reports concern a \$12,000,000 bond issue for the city of Copenhagen being negotiated, and rumor also has it that the Omsk or Kolchak government wants to borrow at least \$25,000,000 here. Although Germany unquestionably will also want to borrow here, no tangible evidence is forthcoming to substantiate the cable story of a \$100,000,000 loan practically placed. Apparently no single American bank will care to stand sole sponsor for such a loan. The one definite German item is the fact that the \$18,000,000 in gold recently received from England by way of Canada was originally paid Belgium by Germany and in turn sent across the Channel.

Quotations on August 5 are as follows:

| | | |
|-----------|--------|----------|
| Sterling: | Cable | 4.37 1/2 |
| | Demand | 4.36 1/2 |
| Francs: | Cable | 7.15 |
| | Demand | 7.20 |
| Lire: | Demand | 8.75 |

Eastern Metal Market

New York, July 30.

All the markets are less active but prices are in most cases firm.

Lessened activity has characterized the copper market the past week, but prices are unchanged and firm.

The tin market has been rather quiet but a small business has been done. The tone is strong.

Lead has enjoyed another advance although the market is quiet but firm.

The zinc market has experienced a reaction, demand has subsided, and prices are lower.

Antimony is quiet but strong.

IRON AND STEEL

Operations at steel plants and blast-furnaces are increasing, especially in the Pittsburgh district, but of its 59 blast-furnaces the Carnegie Steel Co. is operating 46 and its steel ingot capacity is now operating 75 to 80%. A notable feature is that unfilled orders are piling up in a mid-summer month that is usually very dull. There are higher prices in a few lines such as wire products for export, for black sheets and galvanized sheets. Bar mills are pretty well sold up. Some steel companies have sold about 150% of their July capacity and bookings are unbalanced because less than capacity in plates, large bars, and railroad material. It appears that the actual return flow of common labor to Europe has been exaggerated, but there is a scarcity of skilled labor. French steel works engineers are negotiating here for equipment to rebuild two plants, involving \$8,000,000, and it is stated that electric furnaces are to be an important item.

COPPER

After several weeks of brisk demand and an active business at constantly rising prices, the last week has witnessed a marked slackening in the pace—a really healthy condition. But a fair business has been done and the market is very strong with prices firm and unchanged. While electrolytic copper for early delivery is scarce in some quarters it can be obtained in substantial amounts at 23.50c., New York, for August delivery, which we quote as the market. For spot delivery, 24c. rules with 24.25c. at least asked for October where obtainable. Most sellers are refusing to quote beyond October, although demand is excellent for the last quarter, and some will not sell for October. Lake copper is rather scarce but is quoted at 23.75 to 24c., New York, for August delivery, with futures at a premium.

TIN

The fact that exchange rates on England have tended recently to become stronger as against the low point reached a week or 10 days ago has had a firming effect on tin prices here, and the market is stronger. It is still, however, rather quiet. Prices have been erratic due to the fact that some sellers still fear the possibility of lower prices for the pound and refrain from selling while others are conservative and have been doing some business which has resulted in the higher prices. In the last week a little business has been done but not much—perhaps 300 to 500 tons, mostly for future delivery. Prices on Monday for future shipment from the Straits were: July, 53.50c.; August, 53c.; September, 52.87½c.; October, 52.50c. American pure tin is selling at about 68c. with the 99% grade at about 66c., New York. Spot Straits tin, from the allocated metal in consumers hands, is nominal at 70 to 70.50c., New York, with very little moving.

LEAD

Another advance in the price of lead was made July 24, when the American Smelting & Refining Co. raised its quotations from 5.75 to 6c., New York. The independents at once met this and are offering the metal at 6c., New York. The market is quiet and firm at present with quotations for August delivery held at 5.75c., St. Louis, or 6c., New York. It appears that lead from second hands or dealers is now coming into the market at 6c., New York, and intimations are to the effect that this price may be shaded slightly in order for dealers to make sure of their paper profits.

ZINC

The market has turned very quiet and demand has tapered off decidedly. In fact a slight reaction has been experienced and prices have receded until today prime Western for early delivery is quoted at 7.70c., St. Louis, or 8.05c., New York. Although the metal is obtainable at this level it is understood no sales have been made at less than 7.85c., St. Louis, or 8.20c., New York. Without doubt most of the recent business has been taken by dealers and it is thought by some that these stocks have been pretty well exhausted. It seems certain that producers in general are not sellers at present prices but are confidently waiting an upward trend in the near future.

ANTIMONY

The market is strong but quiet with Asiatic grades quoted at 9.25 to 9.37½c., New York, duty paid, for wholesale lots for early delivery.

ALUMINUM

Quotations are unchanged at 32 to 33c., New York, for wholesale lots of No. 1 virgin metal, 98 to 99% pure, for early delivery.

ORES

Tungsten: The week has been a quiet one. Prospective sellers are not anxious to part with their material, hoping that future demand from German-Austrian sources will strengthen the market. Quotations are nominal at \$7 to \$15 per unit in 60% concentrate, depending on the grade and the delivery. There is still no test of the ferro-tungsten market reported and it is probable that the alloy can be bought at about \$1.15 per pound of contained tungsten.

Molybdenum: A small business is reported at 85c. per lb. of MoS₂ in 90% material. The market is lifeless.

Manganese-Iron Alloys: Domestic ferro-manganese, 78 to 82%, is still quoted at \$115, delivered, with business confined to carload and 100-ton lots for early or spot delivery. The British price is \$105, seaboard, but it is probable this would be met on desirable business at \$110, delivered, from American makers. Spiegeleisen is quiet but strong at \$35, furnace.

A field for possible use of steel products is opened up as the result of a movement to require substitution of metal or some other product for wood in making railroad ties. The question was presented to Congress in a resolution introduced by L. C. Dyer, Representative from Missouri, and is now being considered by the House committee on interstate and foreign commerce. Investigation by the Interstate Commerce Commission is urged with a view to recommending legislation by Congress. The substitution of steel for wood for railroad ties, even in part, would require a vast steel tonnage and greatly add to the demands on the steel industry.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

INTERNATIONAL MINING MACHINERY EXPOSITION

Some weeks ago an announcement that the Merchants and Manufacturers Exchange was to take over Grand Central Palace, New York, for the purpose of turning it into a big trade clearing house, caused considerable comment in many lines of industry, especially the mining world. This announcement has now been followed by another, that one of the big permanent expositions will be the International Exposition of Mining Industries. This branch of the exposition is expected to fill a long-felt want

Trading Corporation, of which Alfred I. du Pont is president, owns and controls the Merchants and Manufacturers Exchange. It has, in the leading cities of the world, 19 branch offices and 3000 foreign selling agencies. Through representatives of the Nemours Trading Corporation inquiries from many parts of the world where machinery and other commodities are desired will be referred to the Merchants and Manufacturers Exchange, and those pertaining to mining will be referred to the Mining Exchange. Exhibitors of the specified lines of goods will be notified.

COMMERCIAL PARAGRAPHS

The Ivanpah Copper Co., of Cima, California, is installing a large surface tram which was sold to it by Collins & Webb, machinery dealers, of Los Angeles.

Camden Forge Co., Camden, New Jersey, has established a New York district sales office at No. 2 Rector St., with Samuel W. Hilt as manager.

The Westinghouse Elec. & Mfg. Co. has issued a publication covering electric arc welding and accessory apparatus. Different processes of welding, such as autogenous, forge, oxy-acetylene, and thermit are compared with the electric arc.

The Mine & Smelter Supply Co. has issued a catalogue describing the Ruth laboratory testing flotation machine. Sizes, types, and principles, are fully illustrated and described. Copies may be obtained from any of the company's offices.

John D. Hoff of the Hoff Magnesite Co., Inc., of San Francisco, has been granted patent No. 1307974 for a magnesite kiln which is constructed for the special burning of magnesite when the calcined magnesite which they manufacture is to be used for plastic flooring and stucco work.

United Filters Corporation has established a sales office at 35 Montgomery St., San Francisco, under the direction of the Western Steel & Engineering Corporation. In addition to this office, the company's activities on the west coast are also taken care of by Kennard & Bierce of Los Angeles and the United Iron Works of Spokane, Washington.

Announcement is made of the removal of the Minneapolis office of the Chicago Pneumatic Tool Co. from the Metropolitan Bank Bldg. to Fifth avenue and Fifth street South, Minneapolis, Minnesota, where a complete stock of pneumatic and electric tools, air-compressors, oil-engines, and rock-drills and parts therefor will be maintained.

Phillips J. Jarvis has resigned his position as sales manager for the St. Louis office of the Sullivan Machinery Co. The following appointments are announced: Marion C. Mitchell has been appointed sales manager for the territory in Indiana and Illinois previously controlled from the St. Louis office, with temporary headquarters at Room No. 2006, Railway Exchange, St. Louis. Don M. Sutor, formerly manager of the El Paso office, has been appointed sales manager for the territory of western Kentucky, western Tennessee, Missouri, Arkansas, Oklahoma, and Kansas (except the

Grand Central Palace, New York

in its field, particularly in the development of foreign and domestic trade. It will include all that is latest and best in machinery used in the development and exploitation of metal mines, non-metal mines, and oil wells, as well as machinery used in the subsequent extraction, reduction, or refining of the raw products by concentration, leaching, cyanidation, flotation, smelting, distillation, coking, and similar processes. The manager will be Howard R. Ward, a mining engineer who has practised in the West for the last 15 years. Prior to entering war work he was for three years consulting mining engineer with the American International Corporation, and in addition to his mining work was associated with the organization of its machinery export companies both home and abroad. Inquiries should be addressed to Suite 421, 405 Lexington Ave., New York City.

The new enterprise has sound backing. The Nemours

oil territory), with headquarters at Room No. 2096, Railway Exchange, St. Louis. Daniel H. Hunter has been appointed sales manager for Louisiana, Texas (except the south-western section), and the oilfields of Oklahoma and Kansas, with headquarters at Dallas, Texas.

'Concentration' is the title of a new catalogue which has just been compiled and published by Allis-Chalmers Mfg. Co. This catalogue, in addition to containing detailed descriptions of the various classes of concentrating equipment, also contains a large amount of valuable data on the crushing and concentrating of ores. It is profusely illustrated, showing not only various types of machinery entering into ore-milling practice but also flow-sheets of numerous representative milling plants. This present catalogue presents a very complete digest of modern milling practice and will be sent to those interested upon application to the Allis-Chalmers Mfg. Co., Milwaukee, Wisconsin.

Among recent shipments made by the Overstrom Manufacturing Co., of San Francisco, were 17 Universal concentrating tables to the Seoul Mining Co., Chinnampo, Korea, and the entire table equipment for the Salina Mining Co., of Zinc, Arkansas, including roughers, coarse-sand tables, fine-sand tables, and slimmers. Other shipments of Universals have recently been made to the following: Blair Mines Co., Blair, Nevada; Chief Cons. Mines Co., Eureka, Utah; Smugler Leasing Co., Aspen, Colorado; Chocaya Cia. Oploca de Bolivia; Crescent Lead & Zinc Corp., Waco, Missouri; Golden Age Junior M. Co., Centerville, Idaho; Original M. & M. Co., Clearinghouse, California.

The aerial tramway being installed by the A. Leschen & Sons Rope Co. of St. Louis for the Cia. Beneficiadora de Pachuca, S. A., is nearing completion. This is one of the most notable aerial tramway installations in Mexico, the line being about $4\frac{1}{2}$ miles in length and built in two sections with an angle station about midway. This station also serves later as an intermediate loading station. The initial capacity of this tramway is 60 tons of ore per hour with an ultimate capacity of 100 tons per hour. Locked-coil track-ropes are used and the Leschen patent flattened strand traction rope. The carriers are of 16 cu. ft. capacity. Good progress has been made in the erection of the aerial tramway for connecting the Walker mine with the Western Pacific railroad at Spring Garden. This tramway has the following principle features: length, approximately 9 miles; elevation loading terminal, 6000 ft.; elevation discharge terminal, 4000 ft.; elevation high point, 7000 ft.; initial capacity, 6 tons concentrate per hour; ultimate capacity, 12 tons concentrate per hour. The tramway is of the Leschen heavy-duty friction-grip type. There will be 8 tension stations and 104 towers. The track ropes are to be of $1\frac{1}{2}$ and 1 in. diameter of locked-coil construction and the traction rope $\frac{3}{4}$ in. Hercules red strand. The carriers for handling the concentrate will be 6 cu. ft. capacity and there will be special carriers for handling merchandise and supplies from the railroad to the mine.

The Llewellyn Iron Works of Los Angeles has issued a handsomely illustrated booklet descriptive of its plant equipment, manufacturing facilities, and the variety of products turned out by its organization. Views of both the Los Angeles plant and the Torrance, California, plant are shown. The booklet features the construction of marine equipment, in the manufacture of which the Llewellyn company made an especially fine record during the War. Practically everything that goes into the construction of marine engines is manufactured within its own plant. The Torrance works includes the Llewellyn open-hearth steel furnaces and rolling mills, steel foundries and gray-iron foundries, having a maximum capacity of 50 tons per day. The main offices of the company, together with the machine-shops, forge-shops, boiler, tank, and structural shops, are

situated at the Los Angeles plant, where the castings and fabricated shapes from the Torrance plant go through the successive manufacturing processes whereby the finished articles are turned out. The company manufactures marine engines and boilers, stationary boilers, tanks, cranes, hoisting machinery, elevators, mining and sugar machinery, foundry and rolling-mill equipment, water towers and pipe, machinery for gas works, oil refineries, towers for wireless stations, and structural steel for viaducts, bridges, and buildings. The Llewellyn company has specialized for many years on mining and milling machinery, and has manufactured and erected some of the largest plants in the South-West.

The illustration herewith is an interesting example of the development of the gear cutting industry in San Francisco. The view, taken in the plant of the Johnson Gear Works Co., of San Francisco, shows a spur gear in process of cut-

Cutting a Large Spur Gear

ting in one of the larger machines with which this plant is equipped. The gear is 58-in. pitch-diameter, 87 teeth, 10-in. face, and $1\frac{1}{2}$ diametral pitch. The blank is made of cast steel. The company has specialized on the manufacture of machine-cut gears only, and has made an exceptionally fine record in small work where the greatest precision is required, as, for example, in the case of the heat-treated gearing for air-craft internal-combustion engines. Gearing for mining and milling machinery is another specialty to which this company has given particular attention, and by reason of its facilities for turning out a large variety of skew, herringbone, spur, bevel, worm, mitre, and rawhide noiseless gearing, it is able to effect quick and accurate replacements of gearing for emergency work on short notice. The plant is open to inspection by interested visitors, and mining men are invited to take advantage of this opportunity and thereby inform themselves as to the facilities offered by this company for the accurate execution of orders within their line of manufacture.

General Office Company
Schenectady, N.Y.

ON August 7 the Senate passed the House joint resolution, Number 76, by which annual assessment work on mining claims during 1919 is suspended. The suspension of this regulation under the mining law was requested by Senators Poindexter and Phipps on account of the scarcity of labor. This exemption from assessment, however, is limited to five locations of any single claimant.

PROSPECTORS may be reminded that by Congressional enactment of the Indian Appropriation Bill, all unallotted lands within the Indian reservations in Arizona, California, Idaho, Montana, Nevada, New Mexico, Oregon, Washington, and Wyoming are now open to lease by citizens or corporations of the United States for the purpose of mining. Claims are to be located in the usual manner, but the locator must file application for a lease within a year and pay rental ranging from 25 cents to one dollar per acre per annum, this rental to be credited against the royalty as it accrues for each year. The leases are for a term of 20 years, with the right of renewal, and a royalty of not less than 5% on the net value of the mineral output must be made to the Government for account of the Indians.

BLUE SKY LAWS are being evaded, says the Commissioner of Corporations in California, Mr. C. E. Bellows. "The corporations that find it necessary to evade the provisions of the Corporate Securities Act," says he, "are not organized for the benefit of the investing public," meaning the legitimate speculator. He is referring chiefly to the oil stocks, representing wild-cats, that are trying to entice the simple and unwary in California. It is not necessary for us to quote the list appearing in his recent circular, because our readers are too intelligent to be victimized by such schemes. However, we would advise anybody buying stock in oil or other mining enterprises to address themselves to the Commissioner of Corporations at 815 Flood building, San Francisco, for the sake of being well advised beforehand.

FOLLOWING the interesting article by Mr. J. J. O'Neill on 'Deposits of Native Copper in Arctic America', appearing in our issue of June 14, and Dr. Willet G. Miller's remarks, in the preceding issue, on the prospects of finding ore in the pre-Cambrian shield of Northern Canada, we are glad this week to publish

an article, by Mr. Ellsworth Y. Dougherty, on the relation of regional deformation to the distribution of ore in this pre-Cambrian terrain. Mr. Dougherty reviews structural conditions in the principal mining districts, namely, Sudbury, Cobalt, and Porcupine; he does it in such a way as to afford guidance to the prospector, a man who deserves all the help that the geologist can give him. The localization of ore deposits is, of course, the subject appealing most directly to the mining engineer. To this also Mr. Dougherty contributes sundry useful hints. Theories may not lead directly to the finding of ore, but they stimulate intelligent observation.

STANDARDIZATION of the symbols used for mine maps has received but scant attention in this country, and as a result maps made in one district are imperfectly understood in another until considerable time has been spent in the study of the various symbols used. Although many of the individual companies have established their own symbols—we recall one set, devised by the International Nickel Company, that was distributed rather widely—nevertheless there has been no general acceptance of symbols throughout the country. Mr. L. C. Uren, Associate Professor of Mining in the University of California, appreciates this fact, and, as the result of a good deal of earnest and thoughtful work, has compiled a set of standards containing the symbols in most general use, which we take pleasure in publishing in this issue under the title 'Conventional Symbols for Mine Maps'. Professor Uren has had the opportunity of comparing the advantages and disadvantages of a large number of symbols collected from many districts, and has selected those that seemed to him the best. We know how greatly, even at a single mine, the mapping can be improved by having the draftsmen conform to the same practice, and we appreciate that it would be much more advantageous if, as is done on the Rand, a uniform style could be accepted. Professor Uren's compilation is the best that we have seen, and we commend it to the attention of all engineers interested in the improvement of this branch of technique.

IN a statement of stock recently admitted to the list of the New York Stock Exchange we note that the issues of two companies are "without nominal or par value." Thus is again acknowledged the fact that the par value of a stock bears no relation to its actual value.

We hope this obvious principle will some day be more clearly recognized, or, rather, more frequently acted upon by mining companies, particularly those in an embryonic stage of their development. The idea has been adopted in one or two instances; the ore assured being represented by debentures, bonds, or preferred stock, whereas the future prospects were represented by stock of no fixed valuation. It is especially desirable that new flotations of dubious worth should not be coupled with the suggestion of their having definite value, thereby stimulating the imaginations of the unsophisticated, who becoming confused over an issue of "1,000,000 shares of a par value of \$10, for sale for the next three days only at 10c.," wander from the wayside and become entangled to their sorrow in the quagmire of low finance.

DEPRESSION in Rand gold-mining affairs has reached the point where a writer in the 'South African Mining & Engineering Journal' asserts that unless matters change for the better Johannesburg within thirty years will be "a modern Zimbabwe," the reference being to the ruined cities of Mashonaland described by Mr. Theodore Bent. The trouble is with the low-grade mines, which are threatened alike by impoverishment in depth and by the increasing cost of exploitation, particularly taxation and labor. Of the 38 mines in operation, 16 are working at a loss; and these employ 5545 Europeans. The total working profit of the Rand, excluding the eight rich mines of the Far East Rand, was only £365,000 in the three months ending February 28, 1919. So says Sir Evelyn Wallers, the president of the Transvaal Chamber of Mines. In reply to his protests, the Secretary of Mines suggests the appointment of a commission of inquiry—which is the customary device of perplexed governments.

HIGH cost of living for professional men is aggravated by the cost of high living, as we have suggested more than once. This is due in part to the extravagant ways of living induced by the easy money made by a small minority of our citizens who buy things with the irresponsibility of a drunken sailor. This line of thought is revived by seeing a list of Stock Exchange quotations, showing the range of prices during the last five years. During this interval many stocks have risen in value so greatly as to have afforded numerous chances of making 'easy money'. For example, International Mercantile preferred has risen from \$3 to \$118.50; Atlantic & Gulf from \$6 to \$167; American Hide & Leather preferred from \$17 to \$132.50; U. S. Industrial Alcohol from \$16 to \$141; and General Motors from \$58.75 to \$227 per share. Twenty industrial stocks show an average rise of over 100%. This means that a considerable number of men have made fortunes without performing any useful service to the community; they have simply gambled luckily. Wall Street serves a useful function as a market; it promotes industry by facilitating corporate enterprise; but much of its hectic activity is no better than that of a casino; it is an in-

dustrial Monte Carlo, to which are attracted large numbers of clever men whose abilities are directed into an unproductive channel. Scores of citizens of first-rate ability, potential captains of industry, clever executives, and able administrators, spend their time with the ticker and the tape. The number of dynamic men drowned in the maelstrom of Wall Street represents an enormous economic loss to this country. Gambling is bad for all concerned—the winner, the loser, and the community. Speculation is inseparable from the hazards of industry; but gambling is not essential; it is demoralizing. One of the after-effects of the War has been the wild spending of money by a host of fortunate gamblers and profiteers, whose activities have been detrimental to the community both in their manner of winning wealth and in their way of using it. Wall Street is a necessary institution, but it needs discipline.

Gold, Prices, and Debts

On another page we publish a timely and incisive contribution on this subject from the pen of Mr. R. B. Brinsmade, who has enriched our pages more than once. Supplementing the figures quoted by him in regard to the rise in prices, we may state that, according to the Bureau of Labor Statistics, the average increase in the cost of food-stuffs has been 88% since 1913; of wearing apparel, 120%; of fuel and light, 45%; and of furniture and furnishings, 125%. The dreary science of economics has begun to interest all of us; on every side are heard angry protestations against the incidence of prices that undermine the happiness of the home. Mr. Brinsmade writes as a professional man, as the representative of a class that stands between the devil and the deep sea, between the entrenchments of capital and the advancing barrage of the labor-unions. We share his opinion of the orgy of profiteering associated with our participation in the War and the inadequacy of the small profit-tax to adjust the account established by price-fixing, which served largely to justify the arrogance of the labor-unions, themselves representing less than 10% of the workers in this country. After all, in discussing the current crisis in the cost of living, it cannot be insisted too often that it is a sequel of world-wide disturbance of values caused by the War. The destruction of life, which represents labor, and of material resources, which means capital, has been enormous. We may be amused at the adroit use made of this argument by the President, when he stated that the lowering of the cost of living is linked with the ratification of the Treaty of Paris and the Covenant of the League of Nations, but we must concede the fact that the world is waiting for the conclusion of international negotiations before it can turn with any sort of confidence to normal industrial activity. In this country we may 'forget' the War and proceed light-heartedly about our business, but in other countries, in which we buy and sell, the effects of the last five years have been incomparably more serious and the dislocated elements of enterprise have yet to be re-assembled, the

confidence of industry re-established, the channels of commerce re-opened. Our national life has been so little disturbed that we are forgetful of the plight of the countries whose manhood has been decimated, whose manufactures have been paralyzed, and whose credit has been crippled. We agree that one step—but by no means the only one—toward a restoration of normal costs is to expedite the ratification of the Treaty and the Covenant, so as to make way for policies of reconstruction. In his speech, which was much more to the point than most of his public utterances, the President laid stress on the vicious circle by which the raising of wages only leads to the increased cost of other things. Indeed, if the price of everything could be increased proportionately, we might be less likely to complain, although it would play havoc with the relations of debtor to creditor as established before the higher cost of living came into effect. The facts concerning the storage of foods and their market price speak eloquently for the absence of proper regulation in the distribution of the necessities of life. Our entire system of distribution, local as well as transcontinental, is glaringly inefficient, and it plays into the hands of manipulators and profiteers. It seems reasonable to suppose that some of these defects and wrongs can be corrected by means of legal enactments already available for that purpose, and it is fortunate that some of the measures for price-control placed in the hands of the Government during the War are still at its service at this time. During the War, we saw, as was to have been expected, much extravagance and a good deal of blundering, but some things were done well, among which the work of the Food Administrator was honorably conspicuous. If the markets could be controlled reasonably and if the distribution of food-stuffs could be regulated effectively during the War by the Food Administration, it should be possible to do something of the kind in time of peace.

The War Minerals Relief Scandal

We return to this subject because it is vital to a large number of miners in the West and concerns a matter of public policy that ought to interest every citizen. We regret to observe several signs of an effort on the part of Government officials to over-zealousness, verging on cheap smartness, in the interpretation and administration of the Act passed by Congress for the purpose of compensating those who, in response to a patriotic call, engaged in the production of chrome, manganese, pyrite, and tungsten, and who, in their attempt to fulfil a national duty, suffered financial loss, chiefly through the bungling of the Ferro-Alloys Section of the War Industries Board last year. In our issue of July 19 we criticized the way in which the Secretary of the Interior, in whose hands the administering of the Relief Act was placed, 'passed the buck' to the Attorney-General, and the latter's technical interpretation of the Act in such a way as to exclude from relief a large number of miners who were importuned to produce the needed minerals by

the press propaganda of Secretary Lane himself. We note that the Relief Commission, now in session at Medford, Oregon, has received a letter from Mr. Henry M. Parks, the Director of the Oregon Bureau of Mines, in which he testifies to having ordered the field staff of his bureau "to do everything possible to encourage new development, and speed up the production of manganese and chrome." According to the Attorney-General's ruling, the fact of engaging in the mining of these minerals at the instance of the Oregon Bureau of Mines will not suffice to justify the award of compensation, because the claimant cannot prove that he had been "asked specifically by one of the five Government agencies named in the Bill." Yet Mr. Parks testifies that in October 1917 he received a letter from Mr. George Otis Smith, Director of the U. S. Geological Survey, requesting him "to exert every effort to increase the domestic production of chrome ore" and "to this end," Mr. Smith added, "the hearty co-operation of your organization is earnestly invoked." Is the Government to go back on Mr. Parks and the members of his staff, stultifying and dishonoring them in the eyes of the men who trusted in them and believed them to be authorized in their efforts to stimulate the production of chrome and manganese in Oregon? Legal gentlemen say that 'good conscience' should determine the validity of claims; we ask what kind of conscience has an official who distinguishes between a request made by "one of the five Government agencies named in the Bill" and a request made known by persons to whom the said agencies appealed for help in advertising their urgent demands, whether it be the director of a State bureau in Oregon or the editor of a respectable paper in San Francisco. In our issue of August 2 we criticized the nature of the cross-examination to which claimants are being subjected by the Relief Commission. There is this further point to be made, that the claimants for larger amounts are able to present briefs prepared by a competent lawyer and they go before the Commission accompanied by a lawyer, so that the amiable attempt to subject them to a crude and misleading psychological test does not succeed, although it does succeed in raising an entirely false issue when applied to the less sophisticated claimants.

Now we come to another unpleasant phase of this affair. We are informed that Mr. J. E. Spurr, Chief Engineer for investigative work under the Act, insists upon having all reports sent to him direct at Washington. When the Relief Bill was passed, a corps of examiners was organized for the purpose of scrutinizing the correctness of the claims presented to the Commission. The reports of these examiners are essential to the adjudication by the Commission, yet the Chief Engineer has refused to allow this necessary information to be given promptly to the Commission, insisting upon the reports being sent to Washington, to be abstracted by him, thereby further delaying the awards, which in any event are going to be unconscionably belated. What is worse, he has seen fit to dismiss an engineer for telling the truth. We regret to make this strong criticism, be-

cause the Chief Engineer has just arranged to become the editor of our competitor at New York, but this is a matter too important to be set aside on personal grounds; it concerns the profession deeply, as will be shown. Among the engineers retained by Mr. Albert Burch, acting for the U. S. Bureau of Mines in its campaign to promote the production of war minerals, was Mr. R. H. Toll, whom we have known for 20 years as an intelligent, trustworthy, and honorable mining engineer. In the performance of his duty he told Mr. L. R. Payne, of Fresno, of the need for intensifying the production of chromite and of the Government's intention to protect the producer by market control. At Mr. Payne's request, he confirmed his verbal statement by a written one to the same effect. This letter was submitted by Mr. Payne as part of his evidence when he presented his claim for compensation to the Commission. Meanwhile Mr. Toll had been again engaged by the Government, this time as an examiner under the Relief Act, and he was doing his work when he received the following telegram from the Chief Engineer: "With reference to claim 480 L. R. Payne & Co., Fresno, California, on March 12, 1919, you wrote the manager a letter in which you state 'In addition to patriotic motives in doing this you had the assurance of the Government through me that you would be protected at least a year on the prevailing market price.' You must be aware that no branch of the Government ever gave such assurance or had the authority for so doing and that you have no authority to make this statement; under the circumstances it would evidently be better if your present temporary appointment, which expires July 31, should not be renewed; will you turn over the claims and data which you have on hand to Mr. Hyder who will leave for San Francisco within a few days." Whereupon Mr. Toll replied by quoting from two statements made by the Chief Engineer himself and now to be found in the records of the Relief Commission. The first was a telegram of August 8, 1918, to Mr. Burch, as follows: "War Board in Washington are all agreed that California chrome production shall be maintained and are ready to take whatever steps are necessary. Just what these steps [are to be] will be determined promptly." The second was a letter of September 30, 1918, to Mr. Charles H. Holbrook, as follows: "Reply to your letter of September 12th has been delayed pending a survey of the chromite situation by various Government departments. The War Industries Board telegraphed to Mr. Burch of San Francisco as follows: 'It may be announced that it is the present intention of the War Industries Board to arrange for continued production in the United States for the first half of 1919 at the rate proportionate to the rate of 1918 production, and the trade will be asked to purchase chromite produced in the United States during the first half of next year at this rate.' No doubt machinery for carrying this program into effect will be devised by the War Industries Board." On September 27, 1918, Mr. H. W. Sanford, chief of the Ferro-Alloys Section of the War Industries Board, telegraphed a little more explicitly:

"It is the present intention of the War Industries Board to arrange for continued chromite production in the United States for the first half of 1919 at a rate proportionate to the rate of 1918 production, and the trade will be asked to purchase chromite of suitable grade produced in the United States during the first half of next year at this rate. No announcement can be made regarding prices. Believe tonnage of domestic chromite produced during the balance of this year can be sold at the average prices paid this summer by the California Chrome Company. If unable to find ready market for ore, wire this office, giving tonnages ready for immediate delivery and guaranteed analysis and prices wanted and to whom already offered and refused. Chemical refractories and steel trades likely buyers." This telegram was addressed to the President of the San Francisco Chamber of Commerce. The references to 'market' and 'rate' made in the statements of Government agents have no meaning, of course, unless they signify a price at which the products mentioned could be sold remuneratively. It seems to us that Mr. Toll was justified in the statement he made to Mr. Payne in June 1918, and confirmed by letter subsequently. Mr. J. S. Diller and other representatives of the Geological Survey told the Californian miner to start the mining of chrome before the War Minerals Bill was passed; the miner in the hills was told that it was "as good as passed"; in the Bill it was stated: "The Secretary of the Interior, with the approval of the President, is authorized from time to time to enter into contracts for necessities for periods not exceeding two years," which was an implicit guarantee of a profitable market for at least two years. One of the oldest games in the world is for a superior to tell a subordinate to do something and then fail in moral courage to back him up later. Mr. Toll's statement to Mr. Payne was based on what he had been told by those in charge of the chrome propaganda; it was made in good faith both to the Government and to the chrome miner. Is a professional man expected to say one thing to the buyer and another to the seller? Is he a mere hireling?

These people at Washington do Uncle Sam small honor if they suppose that so frank, big-hearted, and honorable a gentleman could desire his servitors and assistants to employ such pawky tactics. It appears that the new editor of the 'Engineering and Mining Journal' is to follow in the tradition of his predecessor, who opposed both the War Minerals Bill and the Relief Bill, which was its logical sequel, and, not content with such opposition, has seen fit to sneer at the miner of the West as a 'profiteer' and 'patrioteer'. One word more, to summarize the whole affair: what would be the attitude of the miner, not to the Government, but to the representatives of the Bureau of Mines, Geological Survey, and Department of the Interior, if the United States became involved in another war, calling again for an intensive production of sundry minerals? What would the miner say to these gentlemen? His language, like that of Bret Harte's hero, would be, we venture to guess, "painful and free".

Gold, Prices, and War Debts

The Editor:

Sir—I have been much interested in the extended discussion upon the status of gold. Messrs. Van Dyck, McPherson, Robbins, and Benedict have so thoroughly covered the subject that I would not venture to enter the controversy at this stage did I not believe some points have been overlooked whose elucidation may tend to harmonize the present discord.

First, as to 'value' and 'price'. The statement of Mr. McPherson is ambiguous when he says¹ "Any metal, gold included, derives this [social and intrinsic] value from the amount of social human energy and time expended in its production." If by 'value' he means its market price as a commodity, as measured by the quantity of other commodities for which a pound of metal will exchange, he is evidently mistaken, for this 'value' of any metal is fixed by its cost of production at the marginal class of mines. The 'marginal' class of mines may be defined as the leanest one that has to be worked to supply the current market demand. It is therefore not a fixed class, but will comprise leaner or richer mines according as the market demands more or less of the metal. In the case of the monetary standard, gold, its exchangeable value has been arbitrarily fixed in legal tender by government fiat, and this creates an unlimited demand for it and places within the marginal class of mines all those whose cost of production is around \$20.67 an ounce. The price in money of their product being thus fixed by law, the class of marginal gold mines changes much slower in its personnel than those of the other metals whose output is exposed to all the fluctuations in price of a competitive market.

It is a curious fact that this marginal theory of prices is ignored by many so-called economists. It is simply a corollary of Ricardo's well-proved 'Law of Rent',² whose disregard by Karl Marx in his first two volumes of 'Capital' explains the founding of the Socialist party of Europe, in the early 'seventies, on a quite false economic base. Marx's rectification of his early mistake was only published, posthumously about 1893, in his third volume of 'Capital' and it was then too late to change the economic program of political Socialism, whose recent practice on a large scale has wrecked the industries of Russia.

To date, there have really been broached three distinct problems in this gold discussion, namely: (1) Is it de-

sirable that the price of labor and commodities be indefinitely maintained at the extraordinary high level reached in later 1918? (2) What is the future prospect of the formerly productive gold mines that are now thrown into the sub-marginal class by war costs of production? (3) How can the huge national war debts be equitably settled?

Messrs. Van Dyck and Robbins answer the first question in the affirmative and thereby favor the debtor class in general and the war-debtor nations in particular. But to rescue the gold mines that have been knocked out by these desirable high prices, they propose nothing less than the increase of the mint price for gold, which plan is truly characterized by Messrs. McPherson and Benedict as a debasement of the coinage anciently known as coin-clipping. The chief defence of Mr. Robbins³ for his startling proposal is that in 1812, when the present mint value of gold was fixed in England, a British consol of £100 could buy 100 gold sovereigns, while now it will only buy 59. If a consol sells for £80 in gold, Mr. Robbins claims that the value of labor has risen 25% since 1812, but to prove this it must first be shown that the rate of wages varies with the rate of interest, on which the market-value of consols depends. It seems to me that the recent great fall in consols indicates nothing as to wages, but simply shows a rise in the rate of interest, as would naturally be expected as a result of the destruction of a large fraction of the world's capital by the War.

For many reasons the high price-scale of 1918 seems to be most undesirable. Few appreciate the rapidity of the rise in the cost of living that took place mostly just before and after the United States entered the War. From Dun's index numbers,⁴ based on the price of 300 commodities of which foods count 50%, textiles 18%, minerals 16%, and miscellaneous the balance of 100%, we find that the index for the total cost of living was 100.3 in 1905, 124.5 in January 1914, 124.2 in January 1915, and only 137.7 as late as January 1916. Toward the end of 1916 began the skyrocket rise that carried the index to 169.6 on January 1, to 190.0 on April 1, to 204.8 on May 1, and to 220.7 on November 1 of 1917. In 1918 the rise was less rapid, as it only went from 222.2 on January 1 to 233.2 on October 1 as the maximum. From the standpoint of social adjustment this increase in the cost of living of 60% between January 1916 and November 1917, was a catastrophe. While most war manufacturers and labor-unions profited by the change, or at least

¹M. & S. P., March 22, 1919, p. 332.

broke even, the great middle class of teachers, clerks, and professional workers, along with those living on fixed incomes, found their means of livelihood nearly cut in two through no fault of their own. The whole creditor class was badly wronged also by the decreased purchasing power of their capital. Although Mr. Robbins seems to have little sympathy for such 'holders of securities',⁵ it should be clear to any unbiased student that the ideal condition is a constant index of prices favoring neither debtor nor creditor in the settlement of long-time obligations. Even when after years of suffering and struggle the wage-scales of society may have become adjusted to the 1918 scale of prices, there would yet remain the stigma of general defrauding of creditors to be palliated by those advocating the maintenance of this scale by artificial means, like debasing the coinage.

But however desirable a return to the former price-index may be, our hope is vain because "we are on a permanently higher price-level," according to Professor Irving Fisher,⁶ who attempts to prove his bold assertion by his favorite theory regarding the abject dependence of prices upon the quantity and rapidity of circulation of money;⁷ although no serious student can doubt that the quantity of money in circulation has an important effect on prices, there are other factors which, at times, may be even more weighty, and chief among these recently have been scarcity and price-fixing.

Cheerfully granting that the rise in Dun's index from 100.3 in 1905 to 124.2 in January 1914 was mainly due to a world increase in money circulation, I refuse to follow Professor Fisher beyond this point. How minor a factor was the expansion of credits and circulation on the war-index is shown by the fact that in January 1915, after five months of conflict accompanied by the first huge public loans and the virtual suspension of specie payments by both sides, the index was at the same level as a year previously. A year later, although the same loan and paper-money policy was ever being extended, the index had advanced only to 137.7 and a growing scarcity of commodities—owing to the steadily increasing destruction and the diversion of productive labor to the armies—can easily account for this 10% rise. Even more does scarcity explain the 16% rise of the index to 169.6 at the end of 1916, for this year was marked by the expansion of the army of the most productive of the Allies—Great Britain—to 5,000,000 men.

The 10% advance of the index to 190 in the first three months of 1917 is easily explained by the introduction of the new factor of lawless submarine warfare on February first. The submarine then hindered ocean traffic as much by its menace as by its actual destructiveness, however appalling. After the United States declared war on April 6, the index jumped another 10% to 208.4 within a month, and this was caused by a new stimulant to scarcity, namely, the diversion of a large part of the productive power of the United States, hitherto engaged

in supplying civilization, to the equipping of a huge new army and navy.

For the advance of the index by another 5% to 220.9 in November 1917, an important new factor was added to the previously dominant one of scarcity, namely, the inauguration of price-fixing by the American government. It is true that price-fixing had been practised more or less by our European allies since 1914, but the fact that a large part of their extra supplies had to be bought abroad, in markets unaffected by their price-fixing, rendered its influence on the index of prices of mainly a local nature. There were two plans under which our Government could fix prices with the object of a maximum stimulation of production. The first proposed to fix the price at the cost of production of the marginal producer, and this involved an abnormally high figure, for the maximum production meant the extension of the margin of production sufficiently to include the worst and most inefficient plants. The second plan involved the fixing of a price covering the costs of the efficient plants, which would produce the bulk of the requirements, enabling the smaller and poorer plants also to operate by granting them a bonus on their output, from public funds, to cover their higher cost of production.

The second plan would have implied a lower price for both civilian consumers and the Government, and would have meant a much less expense for the latter, for the bonus to inefficient producers paid on only a fraction of the purchases. On the excuse that the second plan was "impracticable to administer," an objection that had force only for a widely extended industry like wheat-raising, the first plan was adopted, and its evident unfairness, both to taxpayers and consumers, was to be obviated by recovering most of the consequent huge profits of the producers by an excess-profits tax. Another excuse was that the war demand from Europe had already placed munition prices at a high level, and that to attempt to fix prices on the basis of actual costs for the bulk of production was something quite too Utopian to contemplate.

As might have been foreseen by any experienced politician, the taxpayers and consumers were mulcted without even having the consolation of seeing their departed funds recovered by taxation to prosecute the War. During the first fiscal year under price-fixing (July 1917-July 1918) the tax-rate on excess-profits was placed by Congress at less than half the 80% figure then enforced by England. As an example of the pap provided at public expense for scores of pampered producers by a wrong policy of price-fixing, I may instance the United States Steel Corporation, whose net profits during this same year were 250 millions, or double the banner year preceding the Great War and only 50 millions less than for 1916, when profiteering was unhampered and there were no taxes at all to pay.

The unwise policy of price-fixing also reacted badly on labor. Trained to seize the main chance by a lifetime of struggle, our trade-union leaders had seen the

⁷"Money and Its Circulation", by Irving Fisher.

bonanza afforded by the frenzy for labor of the factories supplying the European belligerents, and during 1915 and 1916 had passed from one victory to another. At the end of 1916 they had become so arrogant, by continual success, as openly to menace our national Congress if it dared to reject the Adamson bill, which proposed to increase the wages of train-crews by 25% at the expense of either shareholders or the traveling public.

In 1917 the new policy of price-fixing, with its liberal grants of largess to certain lucky producers, opened up a new series of bonanzas to be exploited by militant trade-unionism, and to ensure continuity of its war operations the Government was forced to establish a War Labor Board with power to arbitrate between capital and labor, and enforce its decrees. Dominated by labor's representative, the radical lawyer F. P. Walsh, this Board adjusted controversies by granting almost anything the unions demanded. In the case of the war profiteer, this simply meant a division of the rich melons between masters and men, but for the public utilities it spelled ruin because their charges for service were fixed by law. The greatest public utilities, the railroads, were leased by the Government soon after the War began in 1917, so their owners were spared the huge losses consequent upon an increase of the average yearly wage of all employees from \$890 at the end of 1916 to \$1450 at present. This increase of 68% totals over \$900,000,000 annually, or as much as the liberal rental paid by the Government to the railroad owners. In spite of the general increase in freight-rates of 25% and the leveling up of passenger fares to three cents per mile, this greater cost of labor and supplies caused a deficit in 1918 of 802 millions, which will fall on the helpless Federal taxpayer.

After this brief review, anyone may see that the causes of the skyrocketing of prices since 1915 have been few and easily dominated under peace conditions, and that we have only ourselves to blame for the consequences if we follow Professor Fisher and submit supinely to a permanent price revolution. As the scarcity of commodities and high wages have caused dearness, therefore to get cheapness again we must simply resume a plentiful production of useful goods and set wages at their former level. This last proposal, I know, will arouse a storm of protests from many humane but superficial economists who form the unwitting claque of professional labor-monopolists like Mr. Gompers and natural-resource monopolists like Judge Gary. The latter recently submitted a list of 'reduced' prices for steel which were 80% above the 10-year pre-war average,⁸ extenuating their dearness by the plea of high wages. Yet if we take the actual increase of wages, it represents only 60% of the \$22 per ton that Judge Gary expects to absorb from the steel consumer above the 1914 price—one far from unprofitable to his corporation.

But, says Mr. Van Dyck,⁹ "Labor will not submit to material reduction in wages . . . and the man who

engages to readjust these conditions by decreasing the scale of living is a fool." And Mr. Robbins remarks,¹⁰ "reduction in costs could only be brought about by increased output of workmen or reduction of wages. There is small possibility that organized labor, backed by a newly created public sentiment, will permit conditions to revert to pre-war standards." It is only the uninformed who fancy that "organized labor" speaks with preponderant authority; actually it comprises some three millions, not 10% of the 35,000,000 of our gainful workers. As only a few Americans have studied much political economy, the voters are prone to be misled by any plausible economic fallacy. Yet even the dullest is beginning to wonder how he is benefited by the 30% (average) increase in his weekly pay-envelope¹¹ when everything he has to eat and wear costs him nearly double what it did in 1915.¹² No! It was not a low-wage scale that made "pre-war standards" unjust for Mr. Robbins' laborers; it was rather the plundering they underwent by various classes of cunning monopolists, who, under legal forms, carried off to their private coffers the lion's share of the social wealth produced by the modern improvements in government and the means of production.

It is clear that war conditions producing scarcity must be completely reversed before the natural interplay of economic forces can be expected to cause much of a drop in the price-index. Yet it was only last month that the formal peace permitted the disbanding of millions of soldiers and their transformation from mere consumers into active producers. Till then, too, ocean commerce was largely occupied with military needs, and the embargo on trade with Central Europe cut from the world's markets a vast population of highly skilled workers. Even now the former immense stream of Russian exports, which long ago ceased to flow, is still stagnant and will remain so until some cure is found for the existing anarchy of that unhappy country. In the United States no relief can be expected from double prices for our chief food-grain until the Government guarantee expires next spring, while a general readjustment of the wage-scale cannot take place until the partnership between our Federal Department of Labor and a selfish trade-unionism is dissolved by the return of the railroads to their private owners at the end of this year. If Professor Fisher had not been so blinded by his pet monetary theory, it is unlikely that, in the face of these facts, he would have been so thoughtless as to assert, as early as April: "Readjustment waits because we keep on waiting for it. We have waited in vain for over three months . . . To talk reverently of 1913-14 prices is to speak a dead language today. The buyers of the country, since the Armistice, have made an unexampled attack upon prices through their waiting attitude and yet price recessions have been insignificant."

⁸'The Public', April 26, 1919, p. 424.

⁹M. & S. P., February 1, 1919, p. 143.

Considering now the practical monetary proposals of the coin-clipping school, we find Mr. Van Dyck quoting as a favorable argument that the ratio of gold supply to the total national indebtedness of the belligerents has decreased from 1:3 in 1914 to 1:15 at present. Yet the veriest tyro should know that public debts have no necessary relation to the gold supply unless they happen to be in the form of redeemable currency or demand-notes; but both before and during the War the bulk of public debts has existed as bonds, payable only at fixed dates in the future.

When Mr. Van Dyck states, "All these conditions seem to imply that the monetary value of gold must be increased, or gold must take a partner, or both of these things must be brought about. If it is at all possible to make a change in our monetary standards now is the accepted time," he admits the possibility of bimetallism being alone a sufficient remedy for a scarcity of money-metal. This is an important concession, even though he afterward repudiates it in his practical program by inextricably blending the restoration of free silver with coin-clipping. International bimetallism has always been feasible theoretically¹³ and now that a decline in the gold supply, relative to currency needs, has rendered it desirable we have luckily also ready to hand the new League of Nations with ample power to put it into successful practice.

As a final irresistible bribe in behalf of their proposals, the coin-clippers offer us a speedy release from our burden of war debt, estimated by Mr. Van Dyck at the end of 1918 for all the belligerent nations as totaling the huge sum of 160 billion dollars, of which some 12% is the share of the United States. It is true that much of the money invested in these war bonds was gained with less work than in normal times, and if the policy of permanent price-inflation had merely to do with the repayment of war-bondholders much could be said for its justice and expediency. Unfortunately, however, a permanent inflation of prices means a general defrauding of creditors by their debtors and such a general social disturbance that no thoughtful economist would advocate it except as a last resort to avoid national repudiation. In the case of the United States, at least, the great war debt can be met readily, in a way to benefit rather than distress society, simply by applying more science to Federal taxation. True it is that in peace-time we must abandon the yield of a war-profits tax, and the income tax is already of sky-scraper height; yet the land-value tax¹⁴ of immense potential yield has never been tried at all by Congress, while the inheritance tax has only been trifled with.

A popular American tradition says "three generations from shirt-sleeves to shirt-sleeves"; and while this has been absurdly discordant with facts for the past half-century, it is still fervently believed by the millions of dupes of a reactionary press. Yet even such may begin

to sit up and take notice when they read the recent statement of Professor Fisher, a mouthpiece of conservative Yale, that "of the 150 or more fortunes yielding incomes of \$1,000,000 per year or over, four-fifths have been accumulating for two or more generations." Whatever may be said in defence of an economic policy permitting the concentration of social wealth in the hands of a few private citizens to use as they please, the law that allows the free bequest of millions is a ridiculous anachronism in any nation with pretensions to democracy, as Andrew Carnegie opined a decade ago. Our hereditary plutocracy is ever a danger to free institutions¹⁵ and, as it has no obligations for public service like the European aristocracies, it is rapidly becoming effete through the vices inseparable from luxurious idleness. The national health would therefore be vitally stimulated by abolishing our aristocracy, along with our war debt, by a graduated inheritance tax.

In my recent book for Mexican reconstruction,¹⁶ I have suggested an inheritance tax varying from 20% for estates of a million to 80% on the surplus above five millions. As 2% of our population owns 60% of the total wealth¹⁷ and a large share of this 60% is possessed by a few hundred multi-millionaires¹⁸, a sincere application of these graduated rates to American estates would soon make both hereditary plutocracy and war bonds a matter of ancient history.

Formulas for Mine Valuation

The Editor:

Sir—There is an optical experiment—Du Maurier wrote a novel round it—proving that we have a blind spot in our eye. And the quite elaborate discussion of valuation formulas which various writers contributed to your columns last year demonstrated the possibility of a callosity in the pineal gland of a mathematician.

There is really no room for any doubt about the correctness of a formula, because they can all be subjected to a simple test that requires hardly any mathematics at all. This is the test:

Given the universal acceptance of this formula in the discount market, can I sell my investment by it at any time during its currency on terms fair to both buyer and seller?

And the only formula that stands up to this test is the one called Morkill's by H. D. Pallister, but which we all know better as Inwood's. The present value of the investment given by the formula proposed by D. B. Morkill in your issue of August 31, 1918, is equally given by the tables of present values of annuities given in pocket-

books. Kemp's 'Engineer's Year-Book' for 1918 gives them on pages 6 and 7, and there is no question at all involved as to the investment of part of the return at any particular sinking-fund rate. On page 1913 of the same year-book the relative merits of various current formulas are discussed by Henry Louis, who concludes, "It may be said that the only really correct method of calculating annuities, which answers all tests applied to it, is the first one," namely, Inwood's.

I have not Hoover's 'Principles' handy, but am surprised by Mr. Pallister's statement that the tables given by that authority are based on Hoskold. My recollection, perhaps at fault, is that they are the ordinary annuity-values derivable from Inwood. If not, then Jove has nodded, just as he has nodded when in comparing the cost of development by a vertical or inclined opening he charged the latter with the cost of a long cross-cut "at surface."

The original purchaser under Whitton's formula cannot pass it on so that the next buyer will come in on a 10%-and-your-money-back basis unless he is prepared to sell on worse terms to himself than these, and the purchaser under Hoskold's formula is always looking round for a chance to sell by Inwood, when he can give a perfectly fair deal and be money in pocket by it.

R. T. HANCOCK.

Jos, Northern Nigeria, July 10.

The Status of Silver

The Editor:

Sir—A recent issue of 'The Magazine of Wall Street' contains a most excellent article by Senator Pittman of Nevada on the 'Status of Silver'. The author shows an unusual knowledge of a vital subject little understood by the average man of affairs. In this article, however, he states:

"Our Government by promising to buy silver whenever it dropped to one dollar per ounce prevented London from fixing the price below that amount. In other words, it took the control of the silver market away from London."

I must beg leave to differ with the Senator in regard to the control of the silver market being taken away from London. Since the passage of the bill referred to, the U. S. Government restriction has been the only thing that held silver down as low as a dollar per ounce. When buyers in China were bidding \$1.30 per ounce for silver, we were forced to sell to the British government at \$1.01½ per ounce. I am fully cognizant of the facts and circumstances which render it absolutely necessary that we should come to England's rescue and assist her out of her serious difficulties in India by supplying her with silver, but so far as winning the War was concerned it made no difference whether England paid \$1 per ounce, \$1.25, or \$2 per ounce.

As evidence that the control of the silver market has not been taken away from London you will note that since U. S. export restrictions have been removed, the

price of silver follows the price of sterling exchange either upward or downward, and even during the strenuous and unprecedented slump in sterling exchange during the past few weeks the price of silver has dropped accordingly, and the silver market is as sensitive to the sterling exchange market as is a barometer to weather conditions.

Permitting London to dictate to us the price of silver not only operates to the serious disadvantage of the silver producers of this country, but is also a very important factor in Oriental trade and world finance.

The whole question is too far-reaching and too complicated to admit of discussion in this brief communication, but the War has changed world financial conditions, and the United States of America, which before the War was always a debtor nation, now being the greatest creditor nation in the world and possessing the greatest resources of any nation in the world, is in position to, and logically should, determine and control the money policies of the world.

There is a world shortage of silver, and the United States and Mexico produce the bulk of the world's supply.

If silver continues to be bought and sold as a commodity, the law of supply and demand will place the price of silver on a very high level as soon as various countries throughout the world now in urgent need of silver commence buying in earnest after peace treaties are settled and ratified.

If the price of silver should be based upon a ratio to gold in proportion to the present and probable future world supply of both metals, that ratio would probably be found to be about ten ounces of silver to one of gold, or in other words, if gold is worth \$20 per ounce, silver would be worth \$2 per ounce. Based upon the present world supply and present world production of both gold and silver, the ratio would make the value of silver considerably more than \$2 per ounce, but Mexico is not now, and for a number of years has not been, producing her normal or potential output.

Concerning the large purchase of silver which the British government desires to make, the following are the minimum prices which in my judgment the U. S. government should receive for any sale of silver which it makes to them:

| | |
|--------|---|
| \$1.25 | per ounce for the 1st 25 million ounces |
| 1.50 | " " " " 2nd " " " |
| 1.75 | " " " " 3rd " " " |
| 2.00 | " " " " 4th " " " |

and 2.00 per ounce for any additional amount.

The facts and existing conditions of the gold and silver situation, world financial conditions, the balance of trade conditions are conclusive evidence that the above prices are fully justified.

The military war emergency having passed, it is now purely a commercial proposition.

Although during the War circumstances and conditions made it necessary for the United States, as a war emergency, to furnish England with vast quantities of

silver, the effect of turning over this large amount of silver to England will operate in a commercial way after the War, in much the same way as the selling of arms and ammunition by a country to a country with whom they expected to soon be at war would operate in a military way. When India, through the British government, has accumulated large reserves of silver, they can stop buying for a time, and as the production of silver comes along in a steady stream and the majority of silver producers must market their silver at once, notwithstanding the universal shortage of the metal, it could for a time be made to appear that there is a production beyond requirements and with its consequent effect upon depression of price.

The effects of the control of the world's silver market is much more far-reaching than merely the difference in price which American silver producers receive for their silver (although that is an item which should not be overlooked). The London control of the world silver market is interwoven with dominance in Oriental trade, and also interwoven with the question of whether the pound sterling shall continue as in the past to be recognized as the unit of exchange of international commerce throughout the world, or whether it shall be transferred to the U. S. A. dollar, and also with the question of world financial supremacy being permanently transferred to the United States of America.

EDWIN D. WOLFE.

San Francisco, August 5.

Smelting Flue-Dust and Fine Ore

The Editor:

Sir—In 1910 at the Erith works of Fraser & Chalmers, near London, I witnessed some experiments in burning the poorest grade of coal-waste in the form of dust in a Bennington vertical boiler arranged for the purpose. The combustion chamber was surrounded by banks of tubes connecting the top and bottom drums. The vertical burner was placed in the middle of the chamber at the bottom and pointed to the top drum, which was about eight feet above it, so that the flame impinged on the bottom head of the top drum, with the result that the whole of the waste matter in the coal-dust was fused into globules, and fell down in a continuous shower into the receiving hopper at the bottom. No waste-dust or ash passed into the outlet-flue or stack.

Thinking of this matter lately, it occurred to me that it would be worth while for the big smelter companies using the coal-dust method of firing reverberatory furnaces to experiment along similar lines in smelting their flue-dust and fine ore, instead of continuing the present practice of recovering the dust from the dust-chambers and then charging it in mass into the furnace only to be carried back again by the draft into the dust-chambers or out through the stack. I would suggest that one way this could be done would be to feed the flue-dust or fine from a bin through a mechanical feeder, in suitable proportion to the coal, into the coal-pulverizer so that it

would be ground with and intimately mixed with the coal-dust and be discharged with it through the ordinary burners into the reverberatory furnace in the usual way. From what I saw at Erith I should expect the flue-dust or fine ore so mixed with the stream of coal-dust to be immediately fused into globules as it left the burners and in the first few feet of its travel through the flames in the furnace. Surely there would be no chance for it to be carried out of the furnace in the form of dust.

Another way would be to place the flue-dust bin and feeder over the furnace and make a new style of burner on the injector principle, so arranged that the inrush of the coal-dust through the nozzle would carry the right proportion of flue-dust or fine ore with it. But I should not expect this plan to work as well as the first one proposed.

W. M. BARKER.

McGill, Nevada, July 31.

MINES IN NEW MEXICO during 1918 produced \$681,000 in gold, 782,000 oz. of silver, 8,235,000 lb. of lead, 98,300,000 lb. of copper, and 24,100,000 lb. of zinc, according to the U. S. Geological Survey. The statistics for 1919 will show a considerable decrease in the output of all metals except gold. The Chino Copper Co., which in 1918 produced 79,340,372 lb. of copper and \$39,732 in gold and silver, produced only 11,512,133 lb. of copper during the first quarter of 1919, owing to curtailment of operations. This company hopes to be able to continue operations at 50% capacity. The Burro Mountain Branch of the Phelps Dodge Co., which in 1918 produced 53,146 tons of concentrate averaging 14.9% copper, was so seriously affected by the drop in the price of copper that it has suspended operations. The Santa Fe Gold & Copper Co. has also ceased operations at San Pedro. During the first five months of 1919 the 85 Mining Co., at Lordsburg, shipped a quantity of silicious copper-silver-gold ore almost equal to that shipped by it during the entire year 1918. Development at Mogollon may maintain an output of silver equal to that of 1918, when the Fanny mill was operated only 5 months. The combined gold districts of Nogal, Whiteoaks, and Baldy have so far produced ore at an increased rate. The decreased shipments of lead and lead-zinc ores from Magdalena and the discontinuance of the shipments of lead from the Organ Mountains district will greatly reduce the output of lead from the State. The suspension of operations at Pinos Altos and the curtailment of operations at Hanover and Kelly will naturally result in a greatly decreased output of zinc.

MINES IN WYOMING produced 7 ounces of gold, 253 oz. of silver, and 754,324 lb. of copper in 1918. The shipments of silver-copper ore from the Sunrise mine, near Hartville, the principal producing mine in Wyoming for several years, have not been continuous in 1919. A mill has been built to treat the dump ores of the old Ferris-Haggerty mines (long idle) at Encampment. The Rambler copper-platinum mine at Holmes has been idle in 1919.

Relation of Regional Deformations to the Distribution of Ore in the Pre-Cambrian

By ELLSWORTH Y. DOUGHERTY

INTRODUCTION. The unusual promise afforded by the pre-Cambrian shield of North America to the seeker of valuable minerals is appreciated by all who have studied this remarkable area of ancient rocks. Formations similar to those that furnish the iron and copper of the Lake Superior region, the nickel-copper of Sudbury, the silver of Cobalt, and the gold of Porcupine occur over a vast expanse of still imperfectly explored country. The efforts of geologists in various districts of the pre-Cambrian area are resulting in important correlations of igneous activity with ore deposition. It is being shown, for instance, that gold deposits like those of Porcupine and Kirkland Lake and other parts of Ontario, and in Manitoba, are genetically connected with the wide-spread so-called Algoman granites. Silver, cobalt, nickel, and arsenic in Cobalt and outlying areas, nickel-copper at Sudbury, native copper in Michigan and in the Coppermine River country are all considered as genetic relatives of basic intrusives and extrusives of Keweenawan age.¹

The hypothesis that ore deposits of the hydrothermal and igneous types can be referred to igneous activity of well-marked epochs is perhaps the most useful generalization yet contributed by students of metalliferous deposits. Since igneous activity and regional dynamic disturbances are so commonly related, and since the history of ore deposition is frequently linked with igneous activity, it follows that the deposition of ore should favor areas of regional dynamic disturbance. The interpretation and application of this general principle to some districts of the pre-Cambrian shield, is the purpose of this article.

STRUCTURAL FEATURES. In many districts, geological maps show the pre-Cambrian terrains dominantly developed in elongated series, due to pressure and folding followed by erosion.² A striking structural feature is the wide-spread general parallelism of the axes of folds. Younger folding is frequently superimposed parallel to folding of a vastly older period. The greater number of the axes of folds strike in two general directions—east-northeast octant or north-northwest. These conditions point to compressive forces of wide regional effect, recurrently active in the same general directions.

SUDBURY. In the Sudbury area the nickel-copper deposits are adjacent to the basic periphery of an elongated

micropegmatite-norite intrusive. The norite intrusive has a major axis trending east-northeast, parallel to the general elongation of the intruded underlying rocks. This elongation of the older rocks was originally developed by regional deformation far antedating the time of norite intrusion. The form of the norite itself seems due in part to its major development parallel to the principal directions of weakness of the intruded rocks and in part to later deformation affecting norite and intruded rocks together and accentuating the old directions of elongation and of weakness. As Coleman writes: "One must think of the underlying country-rock as having been broken and shattered in many places by collapse during the removal of the molten rock from beneath, and also by the mechanical action of the laccolithic sheet spreading out above."³ Such a collapse must have produced lateral pressure upon the borders of the sagging mass, with attendant deformation. The cooling magma itself was under great pressure, as pointed out by Dresser⁴ and others. Gravitative or other modes of segregation were greatly modified by the action of stresses upon the norite and intruded rocks. For instance, 'offset deposits' were formed along deep-seated zones of weakness. The occurrence of the deposits along lines of crushing, brecciation, and shearing has been emphasized especially by Knight.⁵ A noteworthy fact is that such zones of disturbance were mainly developed in the principal directions of weakness of the pre-Cambrian shield as a whole (east-northeast and north-northwest) conceivably linking the Sudbury dynamic phenomena with the major and repeatedly active deformations of pre-Cambrian time. Just as the Sudbury norite is probably the correlative of other large basic intrusives, widely distributed over the pre-Cambrian area, so it is possible that the dynamic effects accompanying and succeeding the norite intrusion are intensified and localized manifestations of Keweenawan deformations of far wider extent.

COBALT, PORCUPINE, AND KIRKLAND LAKE. These districts furnish some interesting and instructive examples of the interrelation of the distribution and localization of hydrothermal ores with stresses of regional development and significance. In these areas it appears that:

1. The loci of ore deposition are sheared surfaces,

joints, folds, and other structures produced by compressive earth forces.

2. The zones of maximum deformation, and therefore of maximum ore deposition, are distributed along certain belts determined by the larger structural zones of weakness.

3. The distribution and configuration of intrusive igneous rocks, conceivably related genetically with the hydrothermal ores, may also be controlled, particularly in regions of pronounced dynamically metamorphosed rocks, by major zones of regional disturbance.

In a former article⁶ I sought to show that the lode-fissures of Porcupine could be explained as due to shearing stresses developed by tangential earth-thrust. In this district, two undoubted results of this movement are seen in the development of schistosity and thrust-faulting, respectively of pre-mineral and post-mineral ages. The inference is strong that the shear-zones, along which the ore was deposited, are manifestations of an intermediate type of deformation, also produced by compressive forces. The wide-spread occurrence of the lodes, cutting numerous types of rocks, and the frequent agreement of the attitudes of the lodes and their component parts, with probable horizontal axes of compression, indicate some widely acting influence such as a compressive earth-movement would provide. The foliated rocks are sometimes contorted, as if by a buckling compressive force; this locus of contortion is not infrequently the place of ore deposition.

In the Kirkland Lake area, the orebodies occur along well-developed smooth planes of dislocation, of dominant east-northeast strike. This is also the principal direction in which the rocks are elongated. Pronounced compression is indicated by the decided squeezing and shearing of the country-rocks along the orebodies. These features and the widespread general parallelism in strike of the lode-fissures to one another and to the main direction of weakness in the district, suggest the origin of the lode-fissures by compressive forces.

The results of geological investigation of the Cobalt district, by A. R. Whitman, indicate that the distribution of the veins has been controlled in part by the folding of the rocks. As shown by a formational contour map, the joints and fractures, along which the ores lie, bear a consistent relation to minor anticlines and synclines developed in conjunction with the major folding of the rocks of the district.⁷

The more productive mines of the Porcupine area lie along parallel belts of east-northeast trends. The schistose rock terrains are characteristically elongated in the same direction. This direction of elongation marks the trend of the axes of major folds, in which strikes of east to north-east predominate. The axes of these folds are now difficult to trace, on account of the extreme constriction of the rocks. However, mapping suggests strongly that the Dome lode-system lies along a major

syncline.⁸ Similarly, some general relation undoubtedly exists between the distribution of the Hollinger-McIntyre lode-system and major synclinal or anticlinal axes. As would be expected, from the interplay of compressive forces, the lodes follow zones of shearing and fracturing with variable strikes and dips, but a large number of the lodes strike in the east-northeast octant. In other words, in agreement with conditions at Kirkland Lake, the horizontal component of dominant differential movement had a wide-spread development parallel to the major direction of weakness in the district (east-northeast in both instances), which is a wide-spread direction of weakness for the pre-Cambrian shield as a whole. In general, the more highly sheared rocks at Porcupine are also zones of maximum ore deposition, as is illustrated by the unusually productive zones of the Hollinger, McIntyre, and Dome mines.

The Kirkland Lake area is an unusually clear example of the occurrence of maximum fissuring and ore deposition along a larger structural locus of weakness. The principal structural feature of the district is a fissured zone of metamorphosed sedimentaries and intruding dikes and stocks; this belt trends mainly east-northeast, and is flanked north and south by older Keewatin greenstones.⁹ The relations suggest strongly a major syncline. The more productive mines lie along this synclinal belt.

The maps and sections of the Cobalt district¹⁰ show plainly that proximity to the folded sill of diabase, with which the silver ores are presumed to be genetically connected, does not alone control the distribution of the ores. The most productive area is in the vicinity of the Cobalt Lake syncline and fault. These structures mark a major zone of disturbance; it would appear that this feature, as well as the occurrence in large volume of the favorably fracturable conglomerate and other fragmental rocks, are dominant factors in promoting maximum ore deposition.

In the Porcupine and Kirkland Lake areas, dikes and stocks of hypabyssal¹¹ intrusives are commonly closely related spacially to the ore-zones. At Porcupine, a schistose quartz-porphyry occurs in considerable volume in the more productive Hollinger, McIntyre, and Dome mines; at Kirkland Lake, feldspar-porphyry and lamprophyre are aggregated to an unusual degree along the synclinal belt already mentioned. In the latter instance it is evident that a major zone of regional disturbance has provided an avenue for dominant hypabyssal injection. At Porcupine, the schistose quartz-porphyry masses tend to occur in belts and are typically elongated parallel to the general elongation of the rocks they intrude. From this relation and the not infrequent parallel disposition of small apophyses of quartz-porphyry along planes of foliation of the intruded rocks, it appears that the

⁷Personal communication to the writer.

elongation of the quartz-porphyry bodies was due, at least in part, to their tendency toward major development in the direction of weakness of the intruded rocks, and hence of the district as a whole.

At both Porcupine and Kirkland Lake, therefore, it is probable that the association of intrusives and ore deposits along recognized belts are expressions of related phenomena, structurally and genetically. In both cases the intrusives are themselves cut by the ore-lodes. It seems clear that major zones of weakness had been established at the time of igneous intrusion and that regional structures determined in large part both the distribution and configuration of the intrusives. Intrusion itself might, under certain conditions, accentuate this weak-

first instance were in the nature of rock material and in the second of volatile metalliferous products, tending to follow the old established paths. Such reasoning would apply, even in the event of a decided interval of time between the solidification of the intrusive rock and the ore deposition; as at Porcupine, where the quartz-porphyry was rendered schistose before ore was deposited within it.

PRACTICAL APPLICATIONS. The realization of the control of rock-structures developed by earth-stresses upon the distribution and localization of hydrothermal ore deposits of the pre-Cambrian shield admits of wide application. The prospector in Northern Ontario knows from experience that gold deposits occur in belts and that it is wise to trace continuations of ore-zones in the direction

PRE-CAMBRIAN REGIONS OF NORTH AMERICA

ness, and through the introduction of a rock of a character different from that of the intruded rocks, an increase in the capacity for differential yielding under pressure would be imparted to that particular locus of the earth's crust. It is logical to suppose that these cumulative intrusive and dynamic effects would afford the most favorable avenues for metalliferous circulation. The recurrence of igneous activity along certain well-marked segments of the earth's crust is one of the truisms of geology. It may be justifiably assumed, therefore, that the very presence of the intrusives is significant of the manifestation of particularly favorable zones for the ascending products of igneous mechanism; these in the

of the longer axes of the rocks. In the pre-Cambrian shield of North America dominant directions of weakness are persistently shown by axes of folds, faults, and elongated rock-masses, and by the streams and lakes that commonly delineate these weaknesses.¹² In large part, these directions of weakness fall within the north-north-

¹²Most investigators of the pre-Cambrian shield, fully appreciate these points. For instance, W. G. Miller described and figured northwest-southeast and northeast-southwest lines of regional disturbance in eastern Ontario, and early suggested some connection of the latter system with the distribution of silver-cobalt ores. Report Ontario Bureau of Mines, pp. 116-119, 1913; also earlier editions.

west and east-northeast octants; the latter is commonly the better developed and more wide-spread; the former may sometimes be the more pronounced, is usually more localized, and probably always traceable. A main structural direction of weakness along belts of disturbed rocks associated with intrusives merits careful prospecting.

Mine operators are usually more concerned with the localization of ore than with its general distribution. The lessons shown by the general dynamic history of the pre-Cambrian shield are important; just as the larger results of regional stress control the general distribution of the deposits, so the minor deformations control their localization. In general, the following suggestions may frequently be applied:

(1) As a working hypothesis, it may be supposed that the orebodies are localized in zones of maximum differential movement, such as the more schistose, sheared, fractured, folded, or jointed rocks. When it is found that one or more of these structures dominantly control the localization of the ore, indications of similar conditions will invite exploration.

(2) Usually one or more types of rocks will show a superior development of fissuring, folding, or other deformative effects, resulting in maximum ore-concentration in the favorably disturbed rocks.

(3) Contact-zones between physically heterogeneous rocks may be favorable loci for differential yielding and hence for ore deposition.

(4) Strikes of the orebodies are likely to bear a consistent relation to the structures of the rocks; this should prove a decided aid in planning cross-cuts.

(5) For any particular locality, one may suspect a certain consistency in the direction of principal axes of stress; recurrent compressive effects, in the same general directions, are likely to occur; their variable superimposed results may be suspected and sought.

These conceptions have been found useful by me in helping to understand something of the causes of ore-localization and the nature of thrust-faulting in the Porcupine district.

THE State of Kentucky is the happy hunting ground of the oil prospector of small means, yet the outcome of his endeavors does not always make him happy. The percentage of unsuccessful tests in the State is somewhat high—about 19%—compared with the average for the country as a whole, which is about 16%, but the oil is found at relatively shallow depths, commonly 300 to 1000 ft., and the cost of drilling wells is low. The rock outcrops in the State are plentiful, and the areas where the geologic conditions are most favorable to the occurrence of oil can be found easily. The most productive group of oilfields in Kentucky is in the vicinity of Irvine, Estill county, and is described in Bulletin 661-D of the U. S. Geological Survey, published in 1916. The second richest group lies in and around Allen county, more than a hundred miles south-west of Irvine. The fields in Allen county are the subject of a report by E. W. Shaw and K. F. Mather just issued by the Geological Survey as

Bulletin 688, and available on request from the Director. A barrel of oil obtained in Allen county was sold in Bowling Green in 1850, but oil in Kentucky has only recently become a product of great commercial value, the production of 1918 having been ten times as great as in 1915. The oil in Allen county is irregularly scattered through the productive area, and a great many of the wells have therefore been failures, but on the whole the county appears to be about as rich in oil as any other county in the State except Estill and Lee.

Tungsten in Portugal

Tungsten generally is called wolfram in Portugal, and is sold by the mines as tungsten tri-oxide, WO_3 , on the basis of its richness in tungstic acid. The production has been from 900 to 1500 tons per year, as nearly as can be ascertained. The ore is usually found in small veins embedded in quartz. There is considerable placer ore, which, during the wartime high prices, was the source of a good revenue to the hands of thieves that operated through the mining district despite special watchmen and Government police. The usual wolfram averages from 55 to 65% tungstic acid, and in some mines, by careful washing, from 70 to 72% has been obtained. Tungsten is found in the central and northern Provinces of Minho, Douro, Traz-os-Montes, Beira Alta, and Beira Baixa, as wolframites, including ferberite iron tungstate, hübnerite, manganese tungstate, wolframite iron manganese tungstate, and scheelite (in very small quantities). Before the War, the cost of production was approximately 300 to 450 escudos (\$300 to \$450) per ton. Increased demand, higher salaries and wages, taxes, and transport charges resulted in an immediate advance in cost to 800 and 1500 escudos per ton. The value of the ascudo dropped to 70c., and even lower. The selling price was established by the Government during the War on the following basis: Mineral with 60% WO_3 , 100 francs at the export station; over 60%, 3 francs more per each unit up to 65%, which means that ore with 65% WO_3 was paid 115 francs; over 65%, 2 francs more per each unit up to 70%, which means that ore with 70% was paid 125 francs; over 70%, 3 francs more per unit. There is no use for tungsten in the country and no importation of ferro-tungsten. It is stated that some local concerns are planning to use the metal, but as yet there have been no actual developments along this line. The end of the War paralyzed the industry and the Government thus far has taken no action. Mine owners have protested against the law of 1917, which imposes a tax of about 180 escudos (nearly \$150) per ton in addition to a similar sum as an export duty. It is stated that during the War German agents paid as high as 115 shillings for a unit of 60% ore. A new law which will be presented to the Government will remove many obstacles that impede the development of this industry, which at one time was a valuable assistant to the Allies. The mines are owned by an American company.

Conventional Symbols for Mine Maps

By LESTER C. UREN

There has been a strong tendency in recent years to standardize everything from mine accounts to the phraseology used in technical writing, but there seems to be a singular lack of interest in every effort to standardize the symbols used on mine maps. On several occasions the topic has been discussed in the technical press and elsewhere, but we have, as yet, no conventional symbols for use on mine maps that might be fairly regarded as having received the stamp of general approval. Only a few of the many symbols that are in use have approached standardization through common usage; and yet there seems to be a real need for agreement on at least the more frequently used symbols. Just as one must be familiar with the phraseology of a technical article in order to gain a full understanding of it, so he must be familiar with the symbols used on a mine map if he is to interpret it properly.

It makes little difference, perhaps, whether we use a full or a half-shaded rectangle, or one with crossed diagonals, to indicate a passage extending upward from a level in order to distinguish it from one extending downward, but if engineers use such symbols indiscriminately and without mutual understanding, much confusion may result. Such symbols are seldom explained in the legend that accompanies the map, and it is generally necessary for the reader to decipher for himself the code that the draftsman makes use of, often at the expense of considerable time and study.

Map draftsmen accustomed to the usage of a group of symbols at some particular property, or among a certain coterie of engineers, have the idea that such symbols have become standard, only to find when transferred to a new organization or locality that their use of these symbols is questioned or misunderstood. An inspection of mine maps, representing the best practice in many widely scattered Western metal-mining districts, shows conclusively that there are no accepted conventions and that no real standards can be said to have been developed.

Much more has been accomplished in other fields of drafting practice than in mine-mapping, in the development of standard conventions. Mechanical draftsmen have a commonly accepted code of symbols that has come into such general use that it is truly a 'sign language'. Architectural and structural draftsmen, too, have developed a fairly well recognized set of conventional symbols.

The accompanying four plates present a series of conventional symbols that are used by engineering students in mine-mapping at the University of California. They have been gathered from various sources,* and they rep-

resent, as nearly as I am able to determine, the nearest approach to a group of standards afforded by a close study of current mine-mapping practice. There are a few repetitions of symbols, since each plate is intended to apply to particular classes of work and be complete in itself. Thus, Plates 1 and 2 contain symbols for use on surface or topographic maps, while those on Plate 3 are useful particularly on maps of underground workings. The symbols suggested on Plate 4 may be used on topographic maps to show areal geology, or they may be applied to geologic maps and sections.

Since these pages are printed in black, it is not possible to reproduce the symbols in the variety of colors in which they would be applied to the map. However, it will be noted that the descriptive lettering on the plates specifies the colors to be used, either for each symbol or for each group of symbols. When no color is mentioned, it is intended that black will be the color used.

Some instructions other than those it has been found possible to give on the plates will assist in the application of these symbols to the best advantage. These will be suggested briefly under the following headings, which coincide with the plate numbers on which the particular symbols discussed are to be found.

PLATE 1. In drawing contours, the heavy contours should come at 100-ft. intervals. If the contour interval is small, however, the accented 100-ft. contours may be too far apart for ready reference, in which case any convenient multiple of five may be used as the interval between heavy contours. The numbers indicating elevations of contours should be lettered in the contour—not above or below it—in a space left for the purpose, and they should always read up-hill. While brown is the color suggested for contours, if tracing cloth and India ink are the media used, it is preferable to use a mixture of equal parts of yellow and brown ink.

PLATE 3

Colors used to accent property lines are preferably applied as a wash, and the tints used should be delicate in tone. The width of this band of color, to give the best appearance, will vary with the scale of the map and the size of the area to be enclosed. For a group of full-sized mining claims plotted on a scale of 500 ft. to the inch, a 1/10-inch band of color looks well. If the same map is plotted on a scale of 100 ft. to the inch, however, a wider band—say, 1/2-inch—will be preferable.

Small triangles, circles, and squares used to indicate triangulation stations, survey stations, monuments, reference points, etc., should be small, ranging between 1/20 and 1/10 inch in their largest dimensions. The best size to use will again depend upon the scale of the map, the latter dimension suggested being appropriate only for maps constructed on a scale of 50 ft. per inch or larger.

Blue stream lines used to characterize watercourses and submerged areas, should be purposely waved, as smooth lines used for this purpose seldom appear well. They should be very fine lines to give the best appearance. The shore-lines should be quite heavy and the nearest adjacent stream-line placed as closely as possible to it, leaving only a narrow white space between. In the case of a watercourse, a small arrow may be added to indicate the direction of flow. This arrow may be placed in the centre of the stream if space between banks permits; if not, it may be placed near either bank.

PLATE 2. Parallel lines representing railroads are spaced at gauge-width, according to scale, on large-scale maps. On small-scale maps, one of the single-line symbols should be used. For temporary tracks, dotted symbols similar in form to those suggested for permanent installations, may be employed.

The symbols used to represent buildings on large-scale maps are improved somewhat in appearance by shading the lower and right-hand edges, as though the source of light were in the direction of the upper left-hand corner of the map and the buildings cast shadows represented by heavier lines. On more elaborate maps, the areas enclosed to represent buildings may be tinted, and a color scheme adopted to indicate the material of which the building is made. Thus, red may indicate a brick building; sepia, one made of wood; gray, iron or steel; blue, concrete; green, stone.

Co-ordinate lines should be made as fine as possible. To facilitate reference, numbers marking their distance from the origin of co-ordinates should be placed at each end of every co-ordinate line, just within the border-line. On tracings, the co-ordinate lines are sometimes placed on the back of the sheet so that they will appear in their proper relation as a convenient convention for reference purposes, rather than as an integral part of the map. This is also done so that erasures may be made on the map without marring the co-ordinate lines. The co-ordinate lines should not be spaced at less than 2-in. intervals; that is, 100 ft. apart on a scale of 50 ft. to the inch, or 200 ft. apart on a 100-ft. scale, etc. On maps plotted to a larger scale than 50 ft. to the inch, the co-

ordinate lines should not be spaced at smaller intervals than 100 feet.

The purpose of a scale-line is to provide a means of scaling distances on the map with the dividers. It also preserves the original scale for reference purposes in case the paper on which the map is made should expand or shrink. A scale-line is particularly necessary if the map is to be later reduced or enlarged by photographic methods.

The meridian arrow, used to indicate the North point on the map, should coincide with one of the co-ordinate lines. The length of the arrow should be proportioned to conform with the size of the map; thus, for a map 27 in. by 40 in., an arrow 6 in. long is suitable, while for an 8½ by 11-in. page, a 2½-in. or 3-in. arrow is long enough. The magnetic declination for the particular locality and for the time at which the survey was made, may be lettered along the stem of the arrow, or, perhaps, indicated graphically by means of a second arrow, marked 'magnetic meridian', through the centre of the arrow pointing the true North.

PLATE 3. Where one level crosses over another, in a composite plan showing several levels of a mine, the lower level will always be dotted. The tints to be applied to the various levels, on both plans and vertical projections, will be carefully selected to give as much contrast as possible between adjacent levels. Thus, blue will never be placed next to purple, nor orange next to red. Should two levels cross each other several times at acute angles in the plan view, there will then be no confusion in following either level beyond the intersections. For convenience in reference, a definite color-scheme may be adopted for coloring the levels, using five or ten colors that are repeated at regular intervals. Thus, if five colors are used, level No. 1 may be tinted red; level No. 2, blue; level No. 3, yellow; level No. 4, purple; level No. 5, green; level No. 6, red; and so on, repeating the same colors in the same sequence for levels 7, 8, 9, and lower levels. Then, as frequently happens, if levels are spaced apart, in elevation, at regular intervals, the space between levels of the same color will always be a constant quantity; a convention useful for many purposes.

Cross-cuts, levels, or adits not in vein-material, or within the orebody proper, are divided into uniform rectangular areas by means of lines cutting across the level at regular intervals. Alternate rectangles, thus formed, are tinted with the same colors as are used on the main drifts with which they connect.

Cross-hatching shown on stoped areas, either in plan or vertical projection, should be of the same color as the tint used on the level below. Another plan frequently practised is to cross-hatch stoped areas in black and also apply water-color or crayon to the entire stoped area to match that used on the level below.

In some cases, on mine maps, it is necessary to indicate progress of operations. In plans and vertical projections of mine openings, the boundaries of excavations are indicated either by solid or dotted lines, and the dates of such boundaries may be printed along them at

intervals. Different colors or conventional hachuring may also be used to indicate areas stoped or lengths of drifts driven during specified periods.

PLATE 4. Methods of indicating different formations and varieties of rocks on geologic maps and sections, involve either the use of symbols of characteristic pattern, or color-washes applied to the different areas according to some conventional color scheme. Plate 4 suggests a group of symbols for a one-color map, such as one made on tracing-cloth for blue-printing, brown or black-process printing, or for photographic reproduction. Freehand symbols are generally preferable to those mechanically formed, though careful spacing and alignment of symbols is usually necessary to produce a satisfactory result.

If colors are used, the pen symbols are, of course, unnecessary. Color conventions for geologic maps possess the great advantage that they do not mask other features of the map, such as topographic details, that are often as important as the geologic data. Color-washes should be applied as lightly as possible, since the effect is more pleasing than if harsh tones are used. If the tint is too light, a second coat may be applied when the first is thoroughly dry. Small areas generally require a somewhat heavier tint than do large areas. An effort should be made to select a color scheme that will contrast adjacent tinted areas, though this is not always possible on account of the vagaries of rock formations.

Maps intended for the use of people not continually in contact with them, or unfamiliar with the symbols used, should be accompanied by a suitable explanatory legend. An alternative plan, that indicated on Plate 1, consists in lettering the names of the rocks at intervals along all contacts. An abbreviation of the rock name is often sufficient, thus: gr. for granite, ss. for sandstone. The U. S. Geological Survey makes use of all three of the methods suggested for indicating different rocks on its geologic maps and adds a complete legend as well.

MANGANESE ALLOYS imported and made in the United States during 1918 derived 35% of their metallic manganese from ore mined in the United States. As the proportion of domestic manganese in such alloys was only 4% in 1913 and 16% in 1916, the domestic miners of manganese made a notable contribution to the nation's independence in mineral supplies in war-time. Had the War continued for another year, domestic ores would probably have supplied half the manganese in the manganese alloys needed by the country.

CHILE COPPER CO., for the quarter ended March 31, 1919, reports a deficit of \$660,769. In the preceding quarter, the surplus amounted to \$300,936, or eight cents per share (par value \$25) earned on \$95,000,000 capital stock. On account of the condition of the copper market operations were curtailed to approximately a 50% basis. Production of copper for the quarter averaged 5,169,641 lb. per month compared with 9,768,505 lb. per month during the last quarter of 1918.

Mining in Colorado in 1918 and 1919

During the year 1918, mines in Colorado produced \$12,705,000 in gold, 6,900,000 oz. of silver, 66,000,000 lb. of lead, 6,190,000 lb. of copper, and 86,550,000 lb. of zinc, according to statistics compiled by the U. S. Geological Survey. The statistics for 1919 will show a considerable decrease in the output of all metals in the State. The production of gold alone will decrease at least \$2,000,000. If production is continued at the rate maintained for the first five months of 1919 the mines of Cripple Creek, which produced \$8,125,000 in 1918, will produce \$1,500,000 less in 1919. The Telluride district, which for several years has been the most persistent producing district in Colorado, will probably not equal its output of 1918, for the prevalence of influenza and lack of electric power reduced the output considerably during the winter and spring. The recent resumption of work at the Humboldt mines will help to maintain the output of silver. The closing of the Smuggler mine and the idleness of the Wasatch mill, at Silver Plume, will mean a greatly reduced output of silver, lead, and zinc from Clear Creek county. Though development work and production in Gilpin county have been resumed, the closing of the Argo mill, at Idaho Springs, and of the associated Fremont mine will cause a decrease in the production of gold which can be offset only by increased production at several mines. The closing of the Iron Silver Mining Co.'s mines and the Greenback mine and the abandonment of the Western Mining Co.'s operations, all at Leadville, means a greatly reduced output of silver and zinc from the Leadville district. The cancellation of contracts for manganese to be supplied from this district has resulted in the suspension of the shipments of lead-silver ores from mines at which manganese was a product. The low price and the lack of market for lead and zinc resulted in the closing of the Wellington mine, at Breckenridge, and the Eagle mines, at Red Cliff. The snowslides and fire at the Sunnyside mine, at Silverton, have handicapped the operation of that mine. The removal of the pumps from the lower levels at Aspen naturally indicates a heavy decrease in the production of silver-lead ores in that district. The shipments of silver ore from Creede have not equaled those of 1918. The silver output of Boulder county may show a small increase and the Camp Bird mine, at Ouray, may resume milling during the year. Development is going ahead in several districts and mines that have stopped shipping, preparing for the time when metal conditions will justify the resumption of production. The closing of the Globe smelter, at Denver, will put an additional burden of freight charges on shippers from Boulder, Clear Creek, and Gilpin counties, who will now ship to Pueblo. Only four lead smelters are now operating in Colorado, none of them at full capacity, and some at less than half capacity. The recent rise in the prices of metals may, however, bring relief sooner than was anticipated, although gold mines continue to be hampered by the prevailing high costs and fixed price for their product.

Slag as a Structural Material

STAFF CORRESPONDENCE

Slag bricks for general building purposes, slag paving, and slag retaining-walls have been in general use about smelting works for a long time, but to Oscar Rohn, general manager for the East Butte Copper Mining Co.,

plate of the form to rest on the tier below. A gin-pole with a boom was erected in the centre of the tank, the method of pouring being for the boom to pick up the bowl from the slag-pot carriage and swing it around to any desired position for pouring the circumferential wall. The conical slag-pot bowls are easily detached from their mountings on the carriage. The pouring of the wall of a tank required about 34 days. After the tank was completed, the inside surface of the wall was given a coating of gunite.

At one point in the wall there is left a gap, or gate, 8 ft. wide, extending from top to bottom. This is closed by 3-in. plank on the inside, backed by 10-in. baulks of timber, arranged so as to be removable. As originally used for thickening, the flotation concentrate was allowed to run in and settle, the supernatant water being drained off and the gate opened to allow the contents to be shov-

eled into a car. This method has been improved, and the present system is to run the tank continuously, removing the thickened slime from the centre by an air-lift. Water is taken off at the top by a wooden launder fixed along the inside of the wall.

This method of construction is neat, serviceable, and cheap, and has also been applied to the main dust-

must be given credit for displaying considerable originality in the employment of blast-furnace slag for construction.

At this company's smelter at Butte, Montana, there are four large tanks built entirely of slag blocks cast in place. One of these tanks is used for thickening flotation concentrate, another for storing water, the remaining two being empty at present.

They are 130 ft. in diameter and 14 ft. deep, with walls 12 ft. thick, except for the upper three feet, which has a thickness of 8 ft. only. A level surface was selected on the slag-dump as a site for the tanks, so that their bottoms are also of slag. The forms were made up of half-inch cast-iron plates, 12 ft. by 3 ft., reinforced by light rails, and were used repeatedly, being moved and set up again as soon as the slag had hardened. The design of the plates for the forms could probably be improved, as the cast-iron cracks, requiring to be repaired by steel plates riveted on. The walls of the tanks were cast in tiers of continuous blocks, each block being 12 ft. long by 2 ft. 9 in. high, as shown in the illustration. Joints were broken in successive tiers, and clay was used to plug the corners or joints of the forms as required. The outside surface of the walls steps back a little at every tier of slag blocks to allow the outside

chamber, the walls of which are built of slag, the roof being of concrete carried on steel trusses resting on the side-walls. The dust-chamber is 224 ft. long by 70 ft. wide, outside dimensions. The walls are 10 ft. thick by 48 ft. high. A steel stack, 15 ft. in diameter by 150 ft. high, is anchored to a foundation (also of slag), which forms the end of the dust-chamber.

TANKS MADE OF BLAST-FURNACE SLAG

INTERIOR OF TANK, SHOWING GATE AND LAYERS OF SLAG-BLOCKS

A FEEDER FOR WET MATERIAL

Apron-Feeder for Wet Material

STAFF CORRESPONDENCE

The accompanying drawing shows the arrangement of a standard Link-Belt apron-feeder for handling slime, flotation concentrate, and other wet and sticky material, as used in the Anaconda reduction works. While it is particularly adapted to the feeding of material containing about 15% moisture, it is quite suitable for handling any other class of feed, especially coarse irregular lumps, or, in fact, anything that cannot be handled by the usual method of a belt-conveyor beneath the bottom of the bin. This arrangement is used at Anaconda for feeding the Wedge roasters (one feeder above each furnace), and for getting wet flotation concentrate out of a storage-bin and onto a belt-conveyor, in the preparation of the mixture forming the roaster charge. It is not necessary to mention the difficulties presented by a bin full of de-watered slime, as anyone whose work includes the feeding of such material will have a lively recollection of his experience. Suffice it to say that the arrangement here shown was installed in place of a belt-conveyor.

The faint lines on the drawing show the original outline of the bin. Suitable alterations were made in this bin to accommodate an end-door, A, of the usual sliding type moved by a pinion, and it is the raising and lowering of this door that determines the amount of feed. The bin has no bottom, the contents resting on the apron-feeder, which travels at the rate of six feet per minute. The widths of the apron and the door are 3 ft. 6 in. and 2 ft. 6 in. respectively.

As it would be impracticable to arrange a belt-drive for this feeder, a ratchet-and-pawl drive is adopted,

which works as follows: The ratchet-wheel, B, is of 3 ft. 4 in. diameter. It is on the same shaft as the driving-sprocket of the apron-feeder, and has motion imparted to it by the up-and-down movement of the rocker-arm, C, whose length is 6 ft. 1 in. between centres. This

CROSS-SECTION

rocker-arm is of cast-iron, and consists of a pair of limbs that straddle the ratchet-wheel as shown in the end view. It is loose on the ratchet-wheel shaft, and receives its motion from a crank, D, designed to give sufficient lift for the pawl, E, to engage in successive teeth on the

ratchet-wheel. When the rocker-arm is depressed, the ratchet-wheel revolves through a small arc and the apron-feeder advances with its load.

To stop the feeder temporarily, or when starting after a shut-down, the handle, *F*, is thrown over so that the pawl is loose on the rocker-arm, and the ratchet-wheel remains stationary. To prevent any backward movement of the ratchet-wheel, a flat spring, *G*, of $\frac{1}{4}$ -in. steel, 24 in. long by 2 in. wide, is bolted to any convenient part of the framing so that its point engages the teeth of the ratchet-wheel. There is a chain-drive at *H*.

While no novelty is claimed for this device, it is of interest at the present time when so many plants are treating flotation concentrate.

Coal in Europe

*It has usually been thought that with the coming of peace, despite the appalling destruction of French collieries, the difficulty of Europe supplying itself with coal would pass away. The destroyed mines of France produced 20 million metric tons (of 2205 lb.) in 1913; but even this enormous loss of coal producing capacity represented only 3% of the total production of Europe, which was, in 1913, 730 million metric tons, so it has a relatively small effect on European coal supplies as a whole; there are other greater factors in the deficiency of production. George S. Rice, Chief Mining Engineer of the Bureau of Mines, who has just returned from an extended mining investigation in France, Belgium, Great Britain, the Rhine Valley, and the Saar district, reports that the shortage of fuel that prevailed during the War continues, and that there is probability of a still more serious deficiency unless the United States can come to the rescue by an extensive program of exporting. He finds that, although there was virtually no destruction of the Belgian coal mines, of which the Germans evidently expected to retain possession, the Silesian, Polish, and the Bohemian mining districts have been, and still are, affected by the military fighting and undoubtedly their coal production will suffer; but the most important effect on production in Europe is the general labor unrest and changes in labor conditions which have brought about serious lessening of coal production. The cost of production is from 75 to 150% greater than in 1913, due to increase in cost of labor and material. In most countries the wages of miners have more than doubled. But the most serious changes, because of its position as the big coal-exporting nation of the world, are those taking place in Great Britain, which in 1913 produced 287,000,000 long tons (2240 lb.) and exported 77,000,000 long tons. The output in the year beginning July 16, when the miners' working day was shortened, will be about 70 million tons less than in 1913. The effect of this on Europe will be shown after indicating the coal situation in the principal countries affected.

In France the consumption before the War was 62,000,000 metric tons (of 2205 lb.), and the production

41,000,000 tons. The destroyed mines in the Nord-Pas de Calais field produced 20,000,000 tons, so that if the consumption of France within the pre-war boundaries were the same now as it was then, there would be a deficit of 41,000,000 tons. It is probable that the consumption within this territory will not be as large for some years, as so many factories in the North of France were destroyed. On the other hand, during the War it was necessary to erect new plants in Central and Southern France. Many of these plants will continue to operate and will require coal. The taking over by France of Alsace and Lorraine, and its occupation of the Saar district, will not relieve the situation materially for the present, as a large proportion of this coal is absorbed locally in the industries of Alsace and Southern Germany. Spain in 1913 imported from Great Britain 3,649,000 tons. Holland in the same year imported 12,000,000 tons, of which, however, only 2,018,000 tons came from Great Britain, the balance being imported chiefly from Germany. The former German Empire was a close second in coal output to Great Britain, producing in 1913, 190,109,000 tons of bituminous coal, and 87,233,000 tons of lignite. The largest part of the production was from the Westphalia or Ruhr field in 1913—114,487,000 metric tons—which Germany retains. Upper Silesia, which has been detached from Germany, produced 49,000,000 tons of bituminous coal, and the Saar basin about 17,000,000 tons. The new German Republic will have a yearly production, based on pre-war capacities, of about 124,000,000 tons of bituminous coal and about 90,000,000 tons of brown lignite.

To summarize: the deficiencies in the several countries were before the War supplied by Great Britain, and Great Britain now faces a loss of its export business through reduction in its coal production. On a pre-war basis of consumption the following tabular statement gives the deficiency in the various countries in Western and Northern Europe which must be met by imports:

| | Long tons (2240 lb.) |
|--|-------------------------|
| France | 20,000,000 |
| Spain | 3,650,000 |
| Italy | 9,650,000 |
| Holland (other than supplies from Germany)... | 2,010,000 |
| Sweden | 4,560,000 |
| Portugal | 1,360,000 |
| Norway | 2,300,000 |
| Mediterranean countries (other than Italy).... | 3,500,000 |
| Denmark | 3,030,000 |
| Total | 50,060,000 |

In 1913 Great Britain supplied 31,000,000 tons to North Europe and 32,000,000 tons to France and South Europe, a total of 63,000,000 tons. If the statements made before the Parliamentary Commission are correct, Great Britain will be able to supply only 23,000,000 tons of coal for export during the year, dating from July 16. There is thus a total deficit of approximately 40,000,000 tons, which, if it is to be supplied at all, can be supplied by America only.

*Abstracted from report by the U. S. Bureau of Mines.

REVIEW OF MINING

ARIZONA

DOUGLAS AND PARADISE.

DOUGLAS.—High-grade ore was recently intersected on the property of the Boras Leasing Co., near Don Luis in the Warren district. The face of a cross-cut from the 300-ft. level, about 200 ft. from the shaft, is said to have penetrated the ore, but the extent of the body has not yet been determined. This lease is on Copper Queen ground between the White Tail Deer and the Night Hawk lease. Six men are employed developing the new strike. Extensive development has been accomplished on the upper levels, considerable ore having been opened nearer the surface. The ore recently found in the Denn mine is developing favorably. On the number 11 cross-cut on the 1600-ft. level a deposit of chalcocite and chalcopyrite is being opened. On the number 6 cross-cut of the 1700-ft. level the entire face of the drift now is in high-grade ore, much of which is said to be native copper. In addition a new orebody was opened recently on the 200-ft. level, adding largely to the known ore-reserves of the property. Arthur Houle, the superintendent, in speaking of the Denn development, said the property now was making a better showing than ever had been expected. The Denn and Shattuck Arizona mines, which although separate corporations are controlled by practically the same interests and have joint management, have resumed shipment of ore to the Calumet & Arizona smelter in Douglas. The size of the shipments has not been announced, but they are said to be on an increasing scale. The Shattuck, an old producer, was practically out of the mining game for several months as a result of a fire on the 800-ft. level. This was extinguished several weeks ago by means of bulkheads and flooding. The Calumet & Arizona smelter at Douglas now is producing sulphuric acid in its auxiliary plant at the rate of 200 tons per day, or approximately 6000 tons per month. This is the capacity of the plant. The bulk of the acid is used by Cornelia, at Ajo, Arizona. Reports from Ajo are to the effect that Cornelia's operations have increased recently and soon will approach normal. Work was started August 4 by the Phelps Dodge Corporation, Copper Queen branch, upon the concentrator that will handle the low-grade ores from Sacramento hill, which will be mined by steam-shovel. About 400 workmen are cleaning up and preparing to resume excavation and foundation pouring, preliminary to erection of the steel framework. Work was begun last fall but stopped when the Government placed an embargo upon structural steel because of war necessities.

PARADISE.—The Hilltop mine, in the California mining district, is driving a third tunnel from the Paradise side of the Chiricahua mountains to develop the silver-lead orebodies cut in the two upper tunnels. A number of ore outcroppings found on the surface were cut by the first and second tunnels. In the upper tunnel fifteen different orebodies were traversed, showing that the surface croppings were conical with the base lying vertically below the surface. Some of the bodies were more than 60 ft. wide. The same orebodies were cut in the second tunnel, at a vertical depth of approximately 1400 ft. The third tunnel in the series is being driven several hundred

MAP OF PART OF ARIZONA

feet lower down the hill. Considerable water has been struck, but it is all handled by the tunnels. All the ore can be handled by gravity. Plans for reduction works are under consideration. L. B. Vickroy and J. O. Fife, the latter president and manager of the Tabotacachi mine in the district of the same name, 50 miles south of Douglas. Revolutionary disturbances caused the temporary abandonment of operations, but the period of enforced idleness has been utilized to develop plans for development of water to supply the needs of the mine and other property in the same district. Mr. Vickroy is satisfied that the mine is one of promise, and expects to open it again as soon as the disturbances in the district have quieted down.

CALIFORNIA

GRASS VALLEY, NEVADA COUNTY, PLACER COUNTY, SIERRA COUNTY.

GRASS VALLEY.—Below is given the full text of the amended agreement between the Mine Workers' Protective League and four of the large mines operating in the Grass Valley district and adopted on July 26. The agreement was signed by J. B. Bennett as president and F. C. Osborne as financial secretary of the Mine Workers' League; George W. Starr for the Empire Mines Co.; A. B. Foote for the North Star Mines Co.; J. A. Fulton for the Idaho-Maryland Gold Quartz Mining Co.; E. R. Abadie for the Golden Center Mining Co. An effort will be made to have the Sultana, Allison Ranch, and Norambagua mines also become parties to this agreement:

To aid our surface and underground men we believe that the following proposition, to remain in force for the period of one year from date, will help the living conditions of our employees and still make it possible for the gold-mining industry of the district to continue:

1. We will abolish the bonus system.
2. We will establish a free market at no cost to the purchaser or seller. This will eliminate the middleman and his profits. This free market will be able to supply goods to the consumer at the lowest cost, overcoming expensive bookkeeping, delivery, and service costs. The free market will handle boots, dry goods, meats, groceries, and in fact goods of every description.
3. We ask that hereafter should any grievances arise that these be taken up with the management and discussed freely and in a proper manner before any drastic action be taken. We welcome the appointment at each mine of a committee of three of our employees, to be chosen by you, to bring to our attention any grievances that may arise, such committee to hold office for six months.

4. Whenever an employee has worked for us continuously for three months he shall be paid 10% of the total wages earned by him during that period. Absence through leave or sickness will not cause the forfeit of this percentage wage increase.

5. As a proof of our sincere desire to aid you we will pay on next pay day one-half of the wages lost by our employees, provided that you return to your former work promptly after the settlement of this matter.

6. We will pay time and a half for overtime and time and a half for Sunday work, with the exception of routine Sunday work such as work in mills or cyanide plants, and pumpmen, engineers, watchmen, and shaft-sinking in mines confining their work entirely to development.

NEVADA COUNTY.—A mining transfer of importance was completed recently when the old Bullion group, comprising the Bullion Consolidated, North Bullion, North Bullion Extension, Leeman ranch, Bullion Lode, Smuggler, La Bruja, Union Jack, and several lesser claims, in all 130 acres, held by the Bullion Con. Gold Mining Co., was transferred to the newly-organized Grass Valley

Bullion Exploration Co. The properties named are a mile and a half south of Grass Valley and have a record of \$1,000,000 production. The largest development has been on the Bullion ground with an incline-shaft 1500 ft. deep with a production of about \$500,000. The Smuggler has a record of some \$300,000; the Union Jack, \$100,000; and the other claims in lesser proportion from operations much nearer the surface. The mines closed fifteen years ago, the Union yielding \$50 ore in a vein from one to four feet in width. The new organization was promoted by George E. Mainhart, C. A. Chapman, and W. D. Seymes, of Ludwig, Nevada, who, with E. J. De Sabla and J. Mulroy, constitute the board of directors. C. A. Chapman has been elected secretary-treasurer and George E. Mainhart, superintendent. The new company is incorporated for \$1,000,000. Plans are being considered to erect a modern electric hoisting plant and three pumps to unwater the Bullion shaft. All buildings are to be fire-proof. The preliminary outlay for the purchase of these properties is reported around \$300,000. Operations are to commence immediately, and will be under the direct supervision of George E. Mainhart.

PLACER COUNTY.—After a long search the channel of the Glenn Consolidated mine in the Last Chance district has been found with gravel running \$25 per car. The mine is owned by Auburn and San Francisco parties.

SIERRA COUNTY.—The gravel known to exist in the Brown Bear mine on St. Charles hill was recently encountered in a 40-ft. raise above the main tunnel, with the bedrock pitching west. The main tunnel is now being driven ahead, and when far enough advanced another raise will tap the centre of the channel. Gravel has been found in the Hawkeye tunnel on Rock creek in a 75-ft. raise.

NEVADA

GOLDFIELD AND PIONEER.

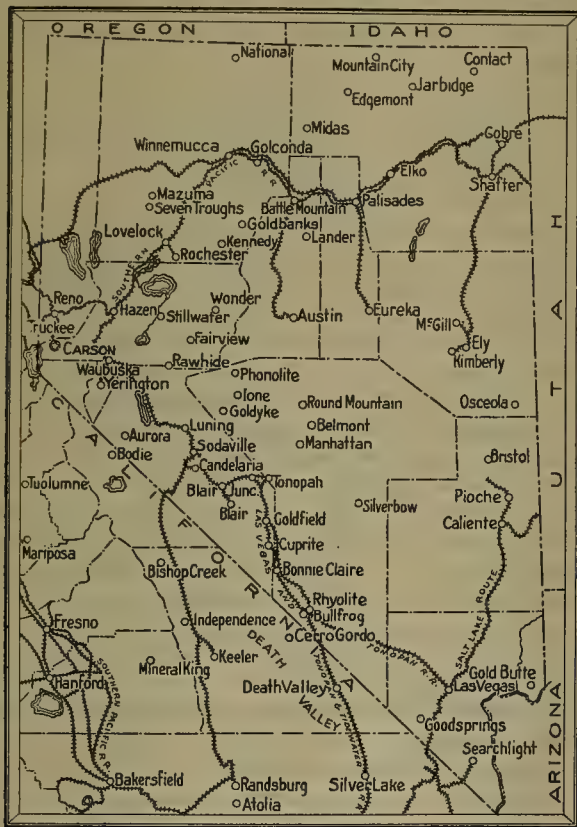

GOLDFIELD.—A. I. D'Arcy has resigned as manager for the Tonopah Divide and Brougner Divide companies to devote his entire attention to the Goldfield Development Co. This company is operating the Goldfield Consolidated group and the north half of the Florence Goldfield mine under a five-year lease. It is officially stated that 2,200,000 tons of ore is exposed. On the 380-ft. level of the Combination mine 1,500,000 tons is blocked out, and 200,000 tons on the 120-ft. level of the Red Top. Connections have been established between the 1,500,000-ton reserve on the 380-ft. level of the Combination and the January shaft, and mining the deposit by the caving system is to start soon. Beyond a porphyritic intrusion on the 120-ft. level of the Red top, formerly thought to constitute the hanging wall of the main orebody, large bodies of high-grade ore have been opened. Rich ore has also been exposed on the surface of the Red Top, Combination, and Mohawk mines by settlement of ground induced by caves in the deeper levels. Arrangements have been made to hoist the product of the Red Top through the Laguna shaft.

Sinking the main winze 40 ft. below the 400-ft. level of the Crackerjack is making good progress. From the 440-ft. point cross-cuts will be extended to the Crackerjack vein, which shows a width of 18 ft. at a depth of 380 ft. The ore contains small amounts of bismuth, copper, and zinc. The Crackerjack is the first vein of profitable ore ever found north of the Columbia Mountain fault, and its development is expected to influence favorably operations in other mines in this part of Goldfield. H. G. McMahon is manager. Under management of F. Sommer Schmidt preparations are being made for comprehensive company work on the Florence. Control of the property

Lone Star Consolidated, Kewanas, and other properties in the district.

PIONEER.—High-grade ore has been intersected on the 500-ft. level of the Consolidated Mayflower, and development is proceeding to determine the dimensions of the orebody. The directors have decided to improve the mill and to place five of the 15 stamps in immediate commission. An assessment of 1c. per share has been levied, payable before September 1. Sinking the shaft of the Reorganized Pioneer has advanced to a depth of 500 ft. Upon reaching the water-level, calculated to be near the 850-ft. point, cross-cuts will be driven to seek the Pioneer vein, which yielded more than \$1,000,000 above the 400-ft. level. All equipment is operated by steam power. W. J. Tobin is manager.

F. Sommer Schmidt, manager for the Florence Goldfield, has announced the first work to be done by the new management. A 1000-ft. cross-cut will be driven from the face of the main south-east drift on the seventh, or 358-ft. level. This will enter territory under a promising outcrop. A 365-ft. cross-cut will be driven west from the shaft on the same level. This will enter the Combination No. 2 claim of the Goldfield Development Co., which has been leased by the Florence, and will be used in prospecting the claim and Florence ground far into the foot-wall of the vein, where no work has been done above this level. The seventh level is considered to be at the most favorable depth, as the bonanza ore-shoots opened by early-day lessees were found in work from this level. These cross-cuts will be the first of 10,000 ft. of development work to be done at an estimated cost of \$100,000. This work will not alter the present leasing policy of the company, which will employ miners in the old workings to develop ore for lessees. Smelter returns from the Florence Divide shipment have not been received. Mr. Schmidt indicated that an extension would be granted the Florence Divide company as compensation for the time lost following the burning of the Florence transformer house. The Giles lease, on the ninth level, or far below the recognized bonanza depth, recently shipped a carload of ore assaying \$289 per ton. Mr. Schmidt said the "several hundred thousand" tons of ore in the territory leased by the Florence to the Development company should prove of higher grade than the ore to be mined by the latter company in the Combination and Red Top, as it had never been re-worked.

MAP OF NEVADA

recently passed to E. L. Whicher of New York, who is also a director of the Goldfield Development Co. The north half of the mine has been leased to the Goldfield Development Co., and leases are being operated on the southern half by the Florence Divide, Crackerjack, Red Hills Florence, and smaller companies. From the 400-ft. workings the Florence Divide recently shipped a carload of ore said to have been worth \$130,000. The Silver Pick Co. is operating a lease on the western end of the Combination and driving a cross-cut to seek the continuation of the Combination vein. The Goldfield Merger is extending a series of raises from the cross-cut on the 910-ft. level to reach the Spearhead vein. Work is carried on from the shaft of the Spearhead company. A small amount of work is proceeding in the Atlanta, Great Bend,

OREGON

WAR MINERALS RELIEF COMMISSION AT MEDFORD.—STATEMENT OF THE DIRECTOR OF THE OREGON BUREAU OF MINES AND GEOLOGY.

MEDFORD.—The War Minerals Relief Commission arrived in Medford from San Francisco on July 27 and began its session in the Federal building the next day. The session consumed the entire week in taking the testimony in the cases of the 174 applicants for relief in the Medford district, which includes the whole of southern Oregon and northern California. The commission con-

sists of three members: Philip N. Moore, of St. Louis, Past President of the A. I. M. & M. E., John F. Shafroth, ex-Governor, Congressman, and Senator from Colorado, and M. D. Foster, ex-Congressman from Illinois. The commission was accompanied by Paul S. Black of Washington, D. C., their counsellor, and H. E. Meyer of Washington, secretary, and several clerks and stenographers. The largest claim to come before the commission in Medford was that of J. F. Reddy, who filed his claim to recover \$80,000 losses in chrome mining in Siskiyou county, California. The next largest claim was that of the Manganese Metal company of Tacoma, Washington, for \$55,000.15, which it expended in its manganese deposits at Lake creek east of Medford. In his testimony, Herbert Brewitt, president of the company, alleges that the money was spent in erecting machinery, reduction works, building roads, ditches, and dams, and in purchasing property in which the ore was located. Two other large claimants heard were Malne & Reichman, chrome operators in the Fort Jones district in Siskiyou county, California, for \$29,435.66, and the Suffern company of Coos county, Oregon, for \$27,516.

The following communication was presented to the commission while in session here by Henry M. Parks, Director of the Oregon Bureau of Mines:

"As Director of the Oregon Bureau of Mines and Geology I am appearing before you to make clear the part taken by the Oregon Bureau of Mines and Geology and the members of its staff in encouraging and stimulating the developments of new properties and increase of production of war minerals during certain periods of the years 1917 and 1918.

"In October 1917 I received a letter from George Otis Smith, Director of the U. S. Geological Survey, a copy of which is enclosed, in which he requests me to exert every effort to increase the domestic production of chrome ore, as per following quotation from his letter, being the last paragraph on the first page:

"'With difficulties limiting the importation of chromite multiplying, it is necessary to exert every effort to increase domestic production of chrome ore and to this end the hearty co-operation of your organization with the U. S. Geological Survey is earnestly invoked.'

"During the month of May 1918 I had occasion to visit Washington, D. C., and called upon Dr. C. K. Leith of the War Import and Export Committee, who called my attention to the impending crisis in war minerals, due to the shortage of ships for importing such materials from foreign countries, and requested me to push with the greatest speed the development of all manganese and chrome properties in Oregon.

"On account of this critical situation in connection with the war minerals demand I ordered the field staff of the Oregon Bureau of Mines and Geology to do everything possible to encourage new development, and speed up the production of manganese and chrome.

"To this end the staff of the Oregon Bureau of Mines and Geology visited many manganese and chrome properties in Oregon and came in direct touch with the miners

and prospectors by correspondence and personal conferences. In all cases where in our judgment an extra effort was warranted, we requested on behalf of the Government the speeding up of the production of development. ●

"This activity on the part of the staff of the Oregon Bureau of Mines and Geology caused many prospectors and miners to engage in an effort to produce these war minerals, as is shown by the fact that Oregon's production of chromite in 1918 over 1917 increased from 7000 tons to 22,500 tons, and the number of producers increased from 26 to 59. Many others engaged in development work, but did not have sufficient time before November 11, 1918, to bring their properties to production."

WISCONSIN

REVIEW OF THE ZINC, LEAD, AND PYRITE INDUSTRIES FOR JULY.

The turning point in the zinc-mining industry from the protracted period of depression that followed the signing of the Armistice came during the month of July. High-grade blende obtained in the Wisconsin field through the process of electrostatic separation was in fair demand at \$47 per ton base; premium grades advanced this price so that top was reached at \$50. The acute scarcity of labor in all branches of industry found labor agents for large operating concerns combing the field and labor centres for men with meagre results. Wages continued high and sliding scales were adopted which ensured a large return for intense individual effort. Men shoveling 40 cans per shift were paid 9c. per can; over 40 and up to 50 cans per shift, 10c. per can; and over 50 cans per shift, 11c. per can; and to men working six successive shifts an additional bonus of 1c. per can for the entire period was paid. Good shovelers earned as high as \$45 per week, and one instance is on record where a human machine earned a little better than \$100 in two weeks. An improved tone in the slab zinc markets of the country stimulated ore buying mid-month, the price of high-grade going to \$50 per ton base; second grades \$47.50. In the third week of the month the price again advanced to \$53 per ton base for premium-grade zinc ore, with \$50 per ton for second grades. The last week of July brought slight advances, high-grade premium blende going to \$53.50 per ton base, and second grades to \$51. Although the Wisconsin zinc-ore sellers had for two months been favored on offerings over the quotations published for the Missouri, Kansas, and Oklahoma districts, when high prices struck the field it was found Wisconsin quotations were under those published for the southern field. This was due to the absence from the field all through July of the Grasselli Chemical Co. of Cleveland, Ohio, for years one of the most aggressive buying concerns in this field. The three big smelters operated by the Grasselli interests were closed down on account of strikes at the smelters, and the absence from the field of their buyers resulted in their quotas going to the American Metal Co., of Langeloth, Pennsylvania, at

about \$3 per ton less than obtained in the Joplin country.

There was no substantial increase in output in spite of higher prices and good demand. Current production was attuned to the immediate requirements of local zinc-ore refineries, and the reserve on hand at the beginning of July showed little alteration at the close of the month, a conservative tabulation of zinc ore, all grades, on hand showing less than 7500 short tons for the entire field. Substantial gains were recorded during the month on the price offerings for lead ore, flat offers of \$62.50 for 80% ore at the beginning of the month advancing \$2.50 per ton by mid-month and again advancing in the last week of July to \$67.50. Even with this gain in price sellers studiously avoided coming into the market with their product, and shipments for the month of July were comparatively small, the recovery being considered. Careful estimates show that there is in the field 1500 tons or more of high-grade lead concentrate. Sellers declare no lead ore will move in quantity until the price has advanced to \$75. Whether holding will bring this figure or not remains to be seen. Carbonate zinc ore production was confined to the mines of the New Jersey Zinc Co. in the northern districts of the field, but aside from the output usually shipped from old producers no especial showing was made. Four new producers were opened up, equipped, and made ready for heavy outputting, but the dull market that has prevailed over a long period for oxide zinc, together with large stocks of the manufactured product in storage, unsold, is keeping down the demand and the production of this class of zinc ore. Independent operators were discussing the feasibility of resuming operations when offerings reached \$32 per ton on an assay basis of 40% zinc content. Several hundred tons of choice concentrate was held in bin at the close of the month. Shippers of iron pyrite (marcasite) were few in number all month. Prices were far from satisfactory and the demand for commercial sulphuric acid was weak. Toward the close of the month, however, the price showed improvement and with it went the price for sulphur ores. The Grasselli Chemical Co. was out of the buying on this as well as zinc ores and such shipments as were made for the month went largely to the General Chemical Co. The improved tone in the zinc-ore markets gave new hope to many independent operating concerns that have been shut-down a long time, and several companies resumed production once more. Two new producers with full equipment came into existence in the Cuba district.

Deliveries of ores from mines to refineries in the field, and to smelters direct, were as follows for July:

| District | Zinc, lb. | Lead, lb. | Pyrite, lb. |
|-------------------|------------|-----------|-------------|
| Benton | 14,840,000 | 336,000 | 1,972,000 |
| Galena | 4,906,000 | 426,000 | |
| Cuba City | 2,226,000 | 64,000 | 774,000 |
| Mifflin | 2,130,000 | | |
| Shullsburg | 1,950,000 | 544,000 | |
| Hazel Green | 1,562,000 | | |
| Highland | 1,140,000 | | |
| Linden | 50,000 | | |
| Total | 28,804,000 | 1,370,000 | 2,746,000 |

Shipments of high-grade blende from refineries to smelters were reported as follows:

| | Lb. |
|-----------------------------------|------------|
| Wisconsin Zinc Co. | 4,254,000 |
| Mineral Point Zinc Co. | 3,550,000 |
| National Zinc Ore Separator. | 3,522,000 |
| Linden Zinc Co. | 426,000 |
| Oliver Mining Co. | 142,000 |
| Block-House Mining Co. | 110,000 |
| Total | 12,004,000 |

The total recovery of crude zinc ore from mills for the month of July amounted to 14,548 short tons; total net deliveries out of the field to smelters, all grades, 7067 tons. Sales and distribution was made to Mineral Point Zinc Co., 5171 tons; Wisconsin Zinc Co., 4433 tons; National Separators, 3717 tons; American Metal Co., 1667 tons; Matthiesen & Hegeler Zinc Co., 1119 tons; American Zinc Co., 922 tons; Linden Zinc Co., 606 tons; Illinois Zinc Co., 417 tons; United Zinc & Smelting Co., 380 tons; Lanyon Zinc Co., 146 tons.

BRITISH COLUMBIA

GENERAL NEWS OF THE PROVINCE.

The Consolidated Mining & Smelting Co. is contemplating the erection of a concentrating plant at Rossland. J. J. Warren, president, S. G. Blaylock, assistant manager, and other officers of the company recently held a conference with the mayor and aldermen of Rossland, with the view to obtaining water and other privileges from the city. The city engineer was instructed to make a survey of the city's water resources, and when he has completed this work another conference will be held between the officials of the company and the city. The company owns a suitable site, and, if water can be assured, it is pretty certain that the company will go ahead with the plant. The first unit will be capable of treating 1500 tons of ore per day, and when that is in working order it is proposed to raise the capacity to 2500 tons per day. Commencing August 1 the Consolidated company raised the pay of all men in the lead-zinc mines and in the smelter 25 cents per day, as the pay of these men had not increased at the same rate as that of the men in the copper mines, the rates fluctuating with the price of the metal. The ore and concentrate received at Trail for the week ended July 31 totaled 9684 tons.

R. F. Green, M. P. for West Kootenay, and Clive Pringle, of Ottawa, have bonded the Silver Bear and Broughton groups, which adjoin the Silver Bell on Kaslo creek. W. E. Newton, who is managing the Silver Bell for Mr. Green and his brother, will supervise the development work on the Silver Bear and Broughton groups. Seattle people are negotiating for the Perrier group, near Nelson. About 50 tons of ore that was shipped from this property recently is said to have realized \$4000. A new strike of silver-lead ore has been made on the claim. A body of rich ore has been struck 30 feet west of the new raise from the No. 10 drift on the No. 8 level at the Silversmith mine, at Sandon. The ore-body measures 12 ft., 4 ft. of which is clear galena,

while the balance is high-grade milling ore. A body of excellent ore has been uncovered at the Rambler-Cariboo, in the Slocan division. The ore was cut in No. 9 level, and measures 9 ft. Four feet on the hanging wall and two feet on the foot-wall is solid galena, and there are several stringers between. The No. 10 level in this mine has been driven along the side of the Jenny claim for 180 ft., and exposes a body of ore two to seven feet wide.

MAP OF PART OF BRITISH COLUMBIA

A raise has been put up to the No. 12 level, exposing the same orebody. Thus, the new body has been developed for 220 ft. on the strike and 150 ft. on the dip. A vein has been opened on the Iron Dollar, Fawn creek, Sheep creek, showing 20 ft. of milling ore, some of which can be culled for shipping. The tunnel at the Queen mine, Sheep creek, is in 1200 ft. The Yellowstone vein was cut at 700 ft., and it is expected that the Queen vein will be cut at 1500 feet.

A new plant, replacing the one destroyed by fire in the spring, has been erected at the Old Sport mine,

Quatsino sound. Two diamond-drills are in operation. Development at the Ecstall river property, in the Skeena division, which the Granby company has been doing for the last two years, is said to be proving an extensive body of low-grade copper ore. In accordance with its agreement with its employees, with the last rise of two cents in the price of copper the Granby company has raised all wages 25 cents. Miners are getting \$5.75, muckers \$5.25 per day of eight hours, and laborers 61½¢. per hour. The Wild Horse Creek Placer Mining Co., at Fort Steele, has erected machinery for working the bed of the creek. Operations have been resumed at La Rose mine, Kitsault river. Ore shipped from this property last year gave a return of about \$350 in silver. The United Metals Co. on the Illiance river has developed an orebody 18 ft. wide, carrying galena and gray copper, some of which runs high in silver. Some of the assays are said to have run up to \$1000 in silver. Eighty tons of ore has been taken out and 50 tons is sacked ready for shipping. The Crow's Nest Oil Co. has struck gas at 1825 ft. on its property at Sage creek. The gas ignited and burned the derrick.

The Hon. W. Sloan, Minister of Mines, accompanied by J. D. Galloway, district engineer, is making an examination of the placer and lode mines in the Cariboo district. W. Fleet Robertson, provincial mineralogist, and W. Brewer, district engineer, are watching in the interest of the Government the experimental tests of the Fleet process for the electrolytic smelting of iron ores that are being carried out by the Vancouver Magnetite Iron & Steel Co. The Government provided 46 tons of ore from Texada island and \$2000 toward the cost of the experiment. It is Mr. Fleet's duty to substantiate his claim that by his process he can produce pig-iron from British Columbian magnetite at a cost of \$13 per ton. In the event of his being successful the Government's money will have been well spent.

The Inland Mining Co. has bonded the Eureka Mines on Eagle creek from the Eureka Copper Mines. The amount involved is stated to be \$60,000, of which \$17,000 has been paid. The same company has the Granite-Poorman property at Granite under bond and proposes to operate the two properties. Already the Granite mill is operating on Eureka ore. Improvements to the Granite-Poorman plant are proposed, among which is the extension of the tram-line from the mill to the Eureka workings. The Inland Mining Co. is composed of mining men of the State of Washington, H. H. Vincent of Walla Walla being manager, and Alfred Bachtold of the same city, secretary. The mine superintendent is B. Crilly of Nelson, B. C.

Gold placer-mining operations are being carried on at Wild Horse creek near Fort Steele on a larger scale than for the last few years. The Gamble Mining Co., after a twelve days run, closed down operations owing to a break in the flume line on Boulder creek. To test the ground a clean-up was made while the repairs were in progress, with results that were stated to be more than satisfactory.

ASSESSMENT WORK SUSPENDED

A dispatch from Washington, D. C., dated August 7, states that House Joint Resolution No. 76 has been passed and sent to the President for his signature. Although the text of the bill is not at hand, it is understood that it provides for the suspension until December 31, 1920, of the annual assessment work to the value of \$100 required on mining claims. Chairman Poindexter and Senator Phipps, Republican, of Colorado, of the Senate Mine Committee, said they had asked for the legislation because of the scarcity of labor with which to do the required work. The exemption from assessments provided in the resolution, however, is limited to five claims of any single claimant.

ARIZONA

Kingman.—The Home Pastime mine at Mineral Park recently shipped a carload of high-grade ore to the smelter. A hoist is being installed at the main shaft and a large pump has been put in to unwater the mine. The old shaft is 300 ft. deep, but development for the present will be carried on at the 150-ft. level. Owing to the present market price of copper it is understood that the Emerald Isle Copper Co. will resume operations immediately. This company has a fair tonnage of oxidized copper ore developed, and recently installed a small leaching and electrolytic plant capable of turning out a ton of copper per day.

Miami.—The A shaft of the Old Dominion Copper Co. is being enlarged to its full size of five compartments between the 18th and 19th levels. This shaft is at present 70 ft. below the 19th level. Extensive development work is being carried on. It is expected that the smelter will be started up the first part of August. A water-softening plant is to be installed at the A shaft power-plant. The Miami Copper Co. has recently completed No. 5 shaft, which is now down 936 ft. The shaft is divided into four compartments by reinforced concrete. Reinforced concrete ore-pockets have also been put in at the main hoisting levels.

Oatman.—The United Eastern Mining Co. has declared a dividend of 7c. per share, payable on August 28 to stockholders of record at the close of business on August 8.

Prescott.—The properties of the Montezuma Mining & Milling Co. in the Bradshaw mountains have been sold to a group of Colorado and California capitalists. The mine is a gold-silver-lead producer and some exploration work was done on the Bear claim by the interests that took it over.

CALIFORNIA

Auburn.—Gravel sampling \$35 in gold per car has been encountered in the Glenn Consolidated, according to F. A. Tillotson, the superintendent. The property lies in the Last Chance district and is owned by George McAulay, A. K. Robinson, and other Auburn people. The channel is said to be 2500 ft. long.

Carrville.—Patrick Holland has sold his placer mine on Coffee creek to C. D. Goodman and J. G. Jackson of Oakland. The mine has been a great producer in years gone by, and was locally celebrated for its coarse gold.

Forest Hill.—The James Garvin gravel claims, adjoining

the old Mayflower group, have been acquired by a syndicate headed by Edward Dorman of San Francisco, M. S. Eldredge of Detroit, H. E. McCullough of Denver, and Major Hill, recently connected with the American Aviation Service. Equipment is to be installed and development actively pressed.

Igo.—Mrs. Mary V. Ballou has brought suit to eject C. C. McDonald, Charles E. Jameson, and V. V. Aperson from a group of claims at the head of South Fork creek, which, she alleges, was jumped on New Year's day. The Court has issued an injunction forbidding the three defendants to mine any more ore until after the case has been heard. These mines are coming into prominence since the revival of mining for silver in the vicinity of Igo.

Kennett.—The Mammoth Copper Co. has increased the wages of men engaged in development work 50c. per day all around. Miners will receive \$4.50 and muckers \$4. This is the scale established at the Bully Hill mine at Winthrop. The Mammoth employs 95 men on development work.

San Andreas.—J. E. King has started shaft-sinking on the Keystone mine, near Railroad Flat, and taken the Selkirk group under bond. Good ore is said to be showing in the Keystone, which has produced well.—The Garibaldi quartz mine, at Jesus Maria, is yielding rich ore after years of desultory development. New interests have secured control and development of new territory has begun.

Taylorville.—Cross-cutting from the 200 and 400-ft. levels of the Gruss mine is in progress, with copper ore of fair grade showing on the 400. The management reports the ore carries silver and gold, and that a 4-ft. vein of molybdenite has been found. It has been decided to install a tube-mill and flotation unit. W. J. Gruss is manager.—The Beardsley Copper Co. has completed a new wagon-road to the mine and arranged for installation of a complete mine plant. A spur is to be built from the Indian Valley railroad to the mine to facilitate shipments of ore. A. L. Beardsley is manager.

Winthrop.—Following the increase in wages granted by the Bully Hill Mines the company has been able to secure a full force of fifty men. Only development work is being done, the purpose being to uncover enough ore to justify an electrolytic plant to cost approximately \$750,000. The oil-flotation plant, completed last year, will be a feeder to the electrolytic. No more ore will be shipped to the smelter at Kennett, as the company can do better on its own ground and in its own plant.

COLORADO

Cripple Creek.—Development was commenced August 1 from the Blue Flag Gold Mining Co.'s main shaft, to connect with the Ophelia or Moffat tunnel, at a depth of 1150 ft. Thence the drift on the Happy Year vein will be carried north to a point directly under the Scott shaft of the War Eagle Consolidated Mines Co., and connection made therewith by raise. The Scott shaft is 550 ft. deep. This work will be done under a contract between the Blue Flag company and the War Eagle Consolidated company, which now controls the Moffat tunnel. With ventilation perfected,

through the two shaft connections, the Moffat tunnel will become a public utility and will be used for transportation and operating purposes by mining companies, mine owners, or their lessees, on properties along the line of the tunnel. The Moffat tunnel heading is now in the Sheriff claim on Raven hill, one of the War Eagle group, at a distance of $1\frac{1}{2}$ miles from the portal, which is on the western slope of Gold hill about a mile south of Cripple Creek. Production for the second quarter from properties of the Vindicator Consolidated company totaled 3215 tons on company account and 5725 tons by lessees. The net earnings of the company approximated \$34,000. The Carlton interests have announced their intention to better lease conditions by issuance of new leases on properties controlled, with a lower scale of royalties on ores marketed and better working conditions. Other companies and mine owners, it is expected, will follow suit and bring about greater activity and accompanying increase of production. The Patterson Bradley Leasing Co., which is operating the Specimen mine on Bull hill, is reported to have intersected a strong body of ore at a depth of 1200 ft. Shipments will soon be leaving the property.

IDAHO

Kellogg.—Agitators among the employees of the Bunker Hill & Sullivan Mining company have succeeded in forcing such a situation that a strike appears almost inevitable. It is stated by reliable investigators that most of the men are contented and do not want trouble, but that the organizers and strong union men are using methods of intimidation and packing meetings with strike voters, which it is feared may result in calling a strike against the wishes of the majority. A committee of employees has attempted to see General McWade, the Federal Mediator, in order to advise him that most of the men are satisfied with their wages and living conditions, and to ask him to use his influence to prevent coercion by the organized and aggressive minority. The Bunker Hill has an enviable record for length of service of many of its men, and it is stated that most of the disturbance is caused by malcontents who are new to the district.

MICHIGAN

Calumet & Hecla's new flotation plant will be in operation in September, according to present plans. The steel work is now all up. When this plant starts all conglomerate sands will be treated by flotation. The sand pile is showing a richer return of copper than ever, the betterment running three pounds per ton. Quincy is changing the mill over in order to utilize the added ball-mills and slime-tables. These are now in operation and it is expected that they will result in an increased production of copper for August.

MISSOURI

Webb City.—The recent increase in ore prices has put new life into the Webb City district, and the first drilling for new ore discoveries to start in this once productive field is being done on the Fremont lease north of Webb City.

UTAH

Alta.—Development at the South Hecla mine is reported to be having encouraging results. Good ore was recently intersected by a winze below the Dwyer tunnel, at a vertical depth of more than 500 ft. The company is shipping 75 tons per day, and employs 90 men. Col. George H. Watson, the manager of the mine, considers conditions in the camp exceptionally promising.

Park City.—Mining conditions are improving here daily. New names are being added to the pay-rolls and new work is being planned for some of the companies. The East Carbonate is driving to cut the contact. Streaks of ore are being encountered.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

D. C. Jackling has returned from Alaska.

M. O. Carlson has returned from Burma to Denver.

George A. Packard, of Boston, is in San Francisco.

William Bayly, of Los Angeles, is at the Palace hotel.

W. E. Simpson of Cobalt is on his way to Glasgow, Scotland.

Kirby Thomas has been examining asbestos mines in Quebec.

A. R. Whitman has returned to New York from Northern Ontario.

William Macdonald has returned from Mason, Nevada, to Berkeley.

F. G. Cottrell is expected at Washington on his return from France.

L. V. Cummins returned to Japan on August 2 after a trip to New York.

Alfred C. Lane has returned from France and is now at Cambridge, Massachusetts.

Robert A. Kinzie has been appointed consulting engineer to the Engels Copper Company.

F. A. Beauchamp has left for Lark, Utah, and expects to be away from San Francisco about ten days.

H. S. Denny has joined with **J. H. Freeman** in organizing the Denny Chemical Engineering Co., in London.

Blamey Stevens, manager of the Lane-Rincon mines, at Temascaltepec, Mexico, is now at El Paso, Texas.

A. F. Keene, of New York, has been inspecting the Trona Corporation's operations at Searles lake, California.

Bancroft Gore has been appointed an Associate Editor of the 'Mining and Scientific Press'. He is now at Boston.

Fred Hellmann and **E. S. Berry** visited the Nevada Consolidated Copper mines at McGill, Nevada, during last week.

Mark Walker has removed his office and laboratory to 512 Wesley Roberts building, Third and Main streets, Los Angeles.

Welton J. Crook left August 6 for British Columbia to install a concentrating plant for the Iron Mountain Limited at Salmo.

B. L. Thane and **Howland Bancroft** announce a consolidation of their engineering offices in the Crocker building, San Francisco.

Henry P. Smith, general manager for the Guanajuato Reduction & Mines Co., has returned from Los Angeles to Guanajuato.

Arthur Lakes, Jr., Major in the U. S. Army, has returned to Denver from service in France, where he was attached to the construction service.

James F. Kemp, **Horace V. Winchell**, **Charles K. Leith**, **Walter H. Wiley**, **Albert Burch**, and **W. H. Emmons** are at Butte as geological experts in the Elm Orlu case.

L. W. Trumbull, for the past six years State Geologist of Wyoming, and formerly Professor of Geology in the State University, has resigned to devote his time to private practice. After September first his address will be 1835 Gaylord street, Denver.

Charles E. Prior, formerly with the Hedley Gold Mining Co., in British Columbia, and recently returned from military service in France, will be married to the daughter of **Gomer P. Jones**, resident manager for the Hedley company, on August 21, at Chatham, New Jersey.

THE METAL MARKET

METAL PRICES

San Francisco, August 12

| | |
|--|-------------|
| Aluminum-dust, cents per pound..... | 50-60 |
| Antimony, cents per pound..... | 9.50 |
| Copper, electrolytic, cents per pound..... | 24.00 |
| Lead, pig, cents per pound..... | 6.25-7.25 |
| Platinum, pure, per ounce..... | \$105 |
| Platinum, 10% iridium, per ounce..... | \$121 |
| Quicksilver, per flask of 75 lb..... | \$105 |
| Spelter, cents per pound..... | 9.50 |
| Zinc-dust, cents per pound..... | 11.00-13.50 |

EASTERN METAL MARKET

(By wire from New York)

Aug. 12.—Copper in London is weak and market is slumping here. Lead market is suffering from outside offerings. Zinc is quiet but fairly firm.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

ORES

Tungsten: The market has seen but little change. It will be some time before it is clear what will be done in the matter of tariff to protect the industry, which is regarded as much needed. A little more inquiry is coming from Europe, but transactions for export are few and comparatively small. Chinese ore has sold around \$7.25 per unit. Quotations range from \$7 to \$15 per unit in 60% concentrate. Some business in ferro-tungsten has been done at \$1.15 per pound of contained tungsten.

Molybdenum: The market is inactive. The last price at which sales were made was 85c. per pound of MoS₃ spot delivery.

Manganese-Iron Alloys: Domestic ferro-manganese is generally held at \$115 delivered east of the Mississippi and north of the Ohio river, but as low as \$110 has been done to meet the quotation of English makers, which is \$105, c.i.f. seaboard. It is to be noted that the British material is 76 to 80%, while the domestic is 78 to 82%. Spiegeleisen is stronger at \$35 for 18 to 22%, but not a great deal is being done.

FOREIGN EXCHANGE

Foreign exchange declined badly again during the week. Sterling demand went to 4.29½ on August 6, which came within 3¼c. of the extreme low established several weeks ago. August 7 showed a slight recovery. France receded to another new low at 7.74 to the dollar, and lire touched 8.90. With an unusually large volume of commercial bills appearing and heavy offerings of the various remittances, the market again approached a demoralized condition. Some of these drafts had apparently been held back in hope of a recovery that did not materialize. Reports from Russia tell of a rate of 75 roubles to the dollar, or 1-1/3 cents per rouble, against normal quotation of 51¼ cents. The same fundamental causes that have been operative for some time are still adversely affecting the exchanges—the heavy trade balance against Europe and the delay in formulating remedial measures on this side. The committee of the Foreign Exchange Bankers' Association gave further consideration and accumulated more data on the subject at a meeting on August 6. The discount on Canadian currency in terms of our dollar still persists near the maximum, with the present margin about 5c., against a record of 5¼ recently. The same story of unrelieved trade balances applies here also.

Gold. It was announced in London on July 24 that an agreement between the Bank of England and representatives of the gold mining companies of the Transvaal had been signed, whereby the free market in the gold produced by these companies is re-established, thus removing the restrictions on export which prevailed during the War.

Quotations on August 12 are as follows:

| | |
|-----------------|-------|
| Sterling: Cable | 4.33½ |
| Demand | 4.35 |
| Francs: Cable | 7.57 |
| Demand | 7.59 |
| Lire: Demand | 8.84 |

Eastern Metal Market

New York, August 6.

The entire situation in metals is adversely affected by the menace to transportation embodied in the threat of railroad employees to start a country-wide strike, while the heavy declines in Wall Street from the same cause have a damaging sentimental effect in the same direction. Most of the metals either show declines or have an easier tendency.

Copper is lower than a week ago.

The interest in tin is largely of a speculative character, based on predictions that the rate for pounds Sterling will go lower.

Outsiders have what business there is in lead and are underselling the leading interest. Consumers are well supplied for the present.

A slight flurry of buying zinc in the latter part of last week ended abruptly and the market is now softer.

Antimony is inactive, with the quotation unchanged.

IRON AND STEEL

In the Cleveland and Chicago districts actual stoppage of blast-furnace and steel-mill operations by strikes of railroad employees has brought home what a general strike of railmen would mean, and the situation is extremely disturbing. Iron and steel plants at Cleveland, Gary, and South Chicago are affected, the Illinois Steel Co. banking 7 out of 12 blast-furnaces at South Chicago. At Gary 14 out of 44 open-hearth furnaces are idle. The production of pig-iron gained in July, the total for the month being 2,428,541 tons or 78,340 tons per day, against 2,114,738 tons in June or 70,495 tons per day. On August 1, 239 furnaces were in blast against 200 July 1. Pig-iron is strong, Southern makers in particular showing a tendency to advance their quotations. Nevertheless, on large lots concessions are reported. Plates continue to be the most inactive of finished steel products, with structural shapes coming next. For bars there is an active demand. The big demand continues in wire products, sheets, and tubular goods, the last named being required by oil-well and line developments. Here and there advances in prices are reported, as in rail carbon bars, which Chicago makers have put up \$2 per ton, and large structural rivets and bolts and nuts. An interesting export inquiry is for 20,000 tons of structural steel required by the Tata Iron & Steel Co., India. The steel is wanted for plant extensions, and could be rolled by the company itself were it not that the British government has requested it to concentrate on the production of steel rails. Belgium has already exported small quantities of pig-iron, bars, and sheets. Belgian bars, prior to the War, and sheets also, were laid down in United States ports both on the Atlantic and Pacific Coast at prices then disturbing to American makers. It may be said that there is but little danger of competition from that source at this time.

COPPER

The quiet market referred to a week ago is now a little more accentuated, as might be expected under existing circumstances. In July a large tonnage of copper was taken by consumers and they are now resting. As already mentioned, the threatened country-wide railroad strike is having a quieting effect on the situation, lessening what buying there might be under the circumstances. Should a strike materialize it is expected that the price of stocks at consuming points will advance sharply, as the metal in hand will be a sure thing. Prompt deliveries also will be strengthened in all likelihood, but a damper may be placed on futures. An interesting item which came to light in Boston

is that the Copper Export Association has sold 1000 tons of copper (electrolytic) for delivery to Germany, the first to be sold to that country in some time. Just how the sale was negotiated, and the financial arrangements made, have not been divulged, but the sale is confirmed. The association has sold approximately 100,000,000 lb. of copper. Prices have declined in the week, and a weak tendency is shown generally, second-hands taking what business there has been. Electrolytic today is around 22.50 to 22.75c. for prompt delivery. For futures a premium is asked, the quotations running up to 25.50 to 24c., for September and October. Most of the producers are unwilling to sell far ahead, which is natural in view of the uncertainties of the situation. Lake copper is scarce and averages about 4c. over the price for electrolytic.

TIN

Tin for shipments from the East in the last quarter of the year is quoted around 53 to 53.25c. For earlier delivery, including September, 54c. is the quotation. Early shipment Straits tin from England is about 55c., and Lamb & Flagg for prompt shipment is 54.40c. American high-grade metal is held at 66.50c., and American 99% pure at 65.50c. Spot Straits is unchanged at 70c., New York. The market is quiet with speculation, based on the probable course of the exchange rate for pounds Sterling, still a factor. Some sellers are willing to sell 1 to 2c. lower than conservative houses because they believe the value of the pound will drop lower; while some consumers are slow to buy for the same reason. Spot stocks are scarce. Some new has arrived in the past few days, but it had no effect on the market as it went directly into consumption. An authority states that no Chinese tin is obtainable, all being shipped from Hongkong to Shanghai where it is being used in the manufacture of tinfoil and household utensils. Only re-sale Banca is available. On the whole the market is quiet.

LEAD

The quotation of the leading producer is unchanged at 6c., New York, and 5.75c., St. Louis, but small producers quote 5.87½c., New York, and other outsiders ask 5.75c., New York. The market has turned quiet, the recent demand having been satisfied. In fact consumers are no longer satisfied even at the lower prices quoted. Producers are making but little effort to sell, for the good reason that they know how their customers are supplied.

ZINC

Prompt delivery metal is held at about 7.95c., New York. Consumers are not interested in the market, but late last week there was some speculative interest shown. With the news of the threatened strike even this subsided, and there are indications of weakness. Most of the producers are said to have but little metal to offer this side of October, a situation partly due to the shutting down of some large plants because of labor trouble. The electrolytic refinery of the Anaconda company is down, as previously reported in print. It can produce 4000 to 5000 tons per month. On Saturday last zinc-ore prices broke about \$5 per ton to \$47.50.

ANTIMONY

In a market almost dead, the quotation is unchanged at 9.37½c., New York, duty paid, for early delivery.

ALUMINUM

Early delivery, 98 to 99% pure, No. 1 virgin aluminum is unchanged at 32 to 33c., New York.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

AN IMPROVED FLOTATION MACHINE

A flotation machine known as the Jones-Belmont cell has recently been perfected by Mr. A. H. Jones, of the Belmont group of mines, who has now become associated with Chas. Butters & Co., Ltd. The cell is constructed of cast-iron, sheet steel, or concrete as conditions may require. It combines the advantages of both mechanical and pneumatic agitation and is so constructed that uniform circulation of pulp is assured at all points. The advantages of mechanical agitation are secured through introducing pulp between two cones of 60° slope, delivering to the bottom of a central

fication and frothing and complete circulation is ensured.

Considered as a pneumatic machine, the device possesses many advantages. The pulp zone above the blanket has only a shallow depth, requiring low air-pressure to ensure satisfactory results and a short upward travel of sulphides to reach the froth zone. The delivery of pulp close to the blanket, and with considerable velocity across it, tends to turn over both gangue and sulphides many times during each passage, allowing every opportunity for the sulphide content to become disengaged from the gangue and join the froth. The decided swirl of the pulp over the blanket tends to carry the froth toward the periphery by centrifugal force, delivering it to a launder at the rim in a free, continuous flow.

This machine does not require the use of surplus gathering oil to make and sustain the froth across the cell to the point of delivery and so avoids difficulties in breaking down a heavy froth in the subsequent operations of thickening and dewatering.

In actual use this machine has never developed any circulating difficulties in handling gangue which is ground fine enough to free its sulphide content for flotation; neither have the heavier sands accumulated on the blanket. A series of eight machines handling hard quartz ground to pass 60-mesh, was closed down for twelve hours without any other precaution than shutting off the power and feed. On starting, no excess power was required to free the impeller, and the pulp was in perfect circulation in five minutes, the machines accomplishing a regular delivery of froth.

All irregularities of feed are compensated by a float-actuated valve which ensures a constant pulp-level. Adjustment of the pulp-level and air can readily be made to suit changes in conditions.

Five Jones-Belmont cells, four roughers, and one cleaner handle from 200 to 500 tons per day, depending upon the character of ore, sulphide content, and dilution of pulp. Each cell requires a maximum of 2½ hp. under full load. The normal air-consumption is 120 cu. ft. per cell per minute.

The machine has been used in British Columbia, California, Colorado, Nevada, and South America, where excellent results have been reported by the operators.

The Jones-Belmont cell is sold exclusively by Chas. Butters & Co., Ltd., 90 West street, New York. This company announces that an experimental station for flotation work will be opened shortly in Salt Lake City. Requests for further information concerning the cell should be addressed directly to the New York office.

It has been announced that Charles Butters, who has hitherto been the managing director of Chas. Butters & Co., Ltd., is no longer associated with the company in any way, but that arrangements have been completed whereby the company retains all its former business and assets intact. American offices have recently been established at 90 West

The Jones-Belmont Flotation Machine

barrel, having both impellers and baffles, which, in addition to emulsifying, also acts as a pump discharging pulp from the top of the barrel with a swirling motion over a circular fabric blanket. At the outer edge of this blanket, pulp is either returned between the two 60° cones over about nine-tenths of their periphery to the bottom of the impeller-barrel, discharged to the next cell, or run off as tailings. These operations are regulated by an automatic, float-actuated valve, which ensures a number of complete circulations of pulp through the impeller-barrel and over the blanket in each cell before being discharged. By this means the sulphides are allowed every possible opportunity for emulsi-

street, New York, where a general business in metallurgical engineering and in the application of their special processes and apparatus to metallurgical and chemical problems will be conducted under the direction of F. L. Bosqui. Correspondents are requested to send all communications to this address.

IS YOUR STEEL TOO LONG?

By F. M. Lee* and J. A. Noyes†

The proper length of drill steel and the number of pieces of steel in a set to drill to a given depth should be given serious consideration. Too often the governing feature seems to be the length of the feed-screw of the rock drill or hammer drill in use. A customary feeding length or run is 2 ft. Consequently the inference seems to be that 24 in. is automatically determined as the proper length of steel changes, and for drilling, say, a 10-ft. hole, five steels will be used, 2, 4, 6, 8, and 10 ft. in length, respectively.

This practice is justified, provided the rock in which the drilling is being done is not so hard, or so abrasive as to wear the gauge or dull the bit unduly. In many mining districts, where the question of drilling efficiency has been

Sullivan Double-Arc Double-Taper Bit

carefully studied, the character of the ground is considered the determining factor, and steel is furnished to the drill runners in 12-in. lengths or even in 9-in. lengths in extreme cases, even though the drilling machine is equipped to handle a 24-in. or longer run.

A bit whose cutting edge is dulled in the first 12 in. of the run or whose gauge loses $\frac{1}{2}$ in. or more in the same distance, certainly cannot drill efficiently for the second 12 in. of a 24-in. run. If a new steel of the same length is inserted to finish the run, it naturally has the same starting gauge as the worn bit, and the result is that if the hole is bottomed at all, it is only by throwing an undue strain on the cylinder and rotating mechanism of the drilling machine, by excessive sledging of the steel or by squibbing, which takes considerable time and wastes powder and fuse. The chances are about even that the bit will be broken or stuck in the hole in the operation.

It should be pointed out that if steel is made up in 12-in. lengths, there is nothing to prevent skipping a length and drilling 24 in. with the next longer steel, where conditions are favorable.

Another important factor is the change in gauge with each successive length of steel, and the shape of the bit itself. Many mines are still using a change of gauge as large as $\frac{1}{2}$ in. for each run of 24 in. The bits used in such cases have the ordinary straight taper, which usually is 14° or thereabout. Experiments have indicated that the Sullivan double-arc bits with a 5° taper, running about 1 in. back from the cutting face, and carrying a 14° taper from that point to the rear end of the wing, provide much greater cutting efficiency. This is indicated by the fact that the gauge changes may be cut down 50%, thus decreasing the size of the starter or first run of steel materially, and at the same

time, permitting a hole of the same diameter to be bottomed as was secured with the old style bits. At a mine in the Joplin district, using double-arc bits of $\frac{1}{2}$ in. variation in gauge, the tonnage per drill-shift has increased 20% since these bits were substituted for crossbits with $\frac{1}{2}$ -in. drop in gauge. This drilling was done in 'stope' (flat) holes 10 to 14 ft. in depth for $1\frac{1}{2}$ -in. powder. The starters formerly used with single taper and crossbits were 3-in. gauge. The starters at present used with the double-arc, double-taper bits are $2\frac{3}{4}$ -in. gauge.

At another mine in the same district, a saving of 20% in cost per ton per drill-shift is being made by this means as compared with the crossbits, having single taper.

At a mine in the Republic district of northern Michigan, which formerly used 14° single-taper bits, double-taper bits were substituted with the following results:

The gauge of the starting steel was decreased from $2\frac{1}{2}$ to $2\frac{3}{4}$ in. It was possible to secure a 10-in. run from each steel instead of an 8-in. run as was the previous case. The drop in gauge is $\frac{1}{2}$ in. During January and February, 1918, 18,096 tons of ore were mined and 17,581 steels were sharpened. During November and December, 1918, 24,940 tons of ore were mined and only 10,991 steels had to be sharpened to produce this tonnage. During the first two months of the year, the old type of bit was in use. During the last two months, the new type of bit was used exclusively. With the old bit, 1.05 tons of ore were broken per steel sharpened, while with the double-taper bit 2.25 tons of ore were broken for each steel that went to the blacksmith shop for re-sharpening.

The double-taper, double-arc bit to which reference is made above can be sharpened by hand with suitable dies and dollies, but can be made up much more accurately and, of course, very much more rapidly in Sullivan drill sharpening machines, which can be equipped for this purpose with special adjustable gauging dies on the vertical hammer, providing for 16 changes in gauge on the same set of dies by merely adjusting a thumb screw and key.

COMMERCIAL PARAGRAPHS

The Chicago Pneumatic Tool Co. has announced the appointment of N. S. Thulin as special railroad representative on the staff of S. C. Sprague, manager of Western railroad sales.

United Filters Corp. has announced a line of filter-presses of the plate and frame and also recessed types to be known as the 'United'. The company is now in a position to furnish the three types of filters in general use, the pressure leaf type, represented by the Kelly & Sweetland filters, the continuous suction type, represented by the American filters, and the plate filter-presses known as the 'United'. Bulletin No. 50 illustrates these new filter-presses, and will be sent on request.

The Lunkenheimer Co., Cincinnati, has announced its intention to build a new plant on a 70-acre site at Carthage, a suburb of Cincinnati, on the Toledo division of the Baltimore & Ohio Southwestern railroad. Buildings will be of one, two, and three-story types, of steel and concrete construction, and there will be provided all modern devices for the manufacture, handling, and transportation of raw material, part finished and finished products. The undertaking will represent an outlay of approximately \$2,000,000. The welfare of the employees has been given special consideration. A piece of land of about eight acres has been reserved as a recreation centre, upon which will be erected an assembly hall, club rooms, base-ball grounds, tennis courts, swimming-pool, etc. Upon this site will also be erected a dining-room capable of accommodating one thousand employees at one time.

“Minerals fairly walk out— on a Wilfley Table”

said one enthusiastic user. Of course “Wilfleys” always have been good tables—we couldn’t have sold 20,000 if they had not consistently maintained definite superiority—but his remark was occasioned by the performance of our latest model equipped with the

New Wilfley Head Motion No. 1623 Riffing and Improved Rocker Bearings

Improved Rocker Bearing,
with Straight Line Motion

Wilfley Improved Self-Oiling
Head Motion

Another reason for Wilfley success lies in its simple and substantial construction. It is the simplest table made—and the strongest.

THE index to Volume 118 of this paper, covering the issues of the first half of the current year, is now ready for distribution. Those who want it should notify this office.

RESUMPTION of commerce with the recently beligerent countries of Europe should be expedited by the gentlemen at Washington if our foreign trade is to be restored without loss of time. We are informed that the French have re-established their canal traffic on 80% of the lines destroyed by the Germans. Night trains have been restored between France and Switzerland, and railroad service from Basle to Paris by way of Belfort has been resumed. Permits for transit from Switzerland to Antwerp and Holland by way of the west bank of the Rhine are being issued.

FAVORABLE action by the Senate Public Lands Committee on a bill for the leasing of Government oil-lands seems to forecast the adjustment of a public grievance that has created much ill feeling in the West. Included in the Bill are provisions by which persons having lawful claims for oil-land on the so-called naval reserves in California and Wyoming can proceed with development. Some of the litigation pending over disputed locations may be adjusted, and some of the restrictions that have interfered with development may be removed so as to expedite an expansion of productive activity. The Bill is much the same as the one that failed of passage in the last session of Congress. It looks as if it might go through this time.

OUR 'Discussion' department has been enriched lately by several notable contributions. In this issue we publish a letter from Mr. N. H. Emmons 2nd on the relation of organized labor to the engineering profession. 'Brains and Brawn' would epitomize the point at issue, but unfortunately the relationship is complicated by a *tertium quid*, namely Capital. We do not deny brains to Capital, for most capitalists became such by successful use of their brains, aided by opportunity, but the motive power of brains becomes subordinated to the mass momentum of money, so that the capitalist becomes the employer of brains and of brawn rather than the user of such of either as he himself possesses. Viewed in this way, the engineer comes between; he stands between the employer and the employee; as a professional man

he cannot be hired in the common way; he directs the operations of Labor in behalf of Capital. Mr. Emmons discusses the subject from this angle and proceeds from it to a consideration of the use of authority in a democracy. Our readers will find his remarks mentally provocative; he is an engineer, he has been retained by capitalists, and he has employed labor on a large scale; so he writes understandingly.

REFERRING to the reform of patent procedure and of the Patent Office itself, as discussed in our issue of July 26, we are glad to note that remedial legislation, originated by the National Research Council and approved by the Engineering Council, has been started in Congress. Three bills have been introduced, known as H. R. 5011, a bill to make the Patent Office independent of the Department of the Interior or any other department, and to simplify the procedure of the Courts with reference to assessment of damages or profits for infringement of patents; H. R. 5012, a bill to establish a single Court of Patent Appeals; and H. R. 5013, a bill to increase the force and salaries in the Patent Office. Mr. Charles A. Terry, chairman of the Patents Committee, requests that representatives of Engineering Council write to their congressmen, urging the passage of these bills, and, so far as convenient, ask their friends to do likewise.

HENRY FORD'S damages of six cents—a nickel, plus war tax—against the Chicago 'Tribune' for libeling him by calling him an 'anarchist', recalls the famous suit between Whistler and Ruskin, in which the verdict for the plaintiff carried with it damages of one farthing. In 1878 a farthing had about the same purchasing power in London as six cents in Chicago today. John Ruskin, in 'Fors Clavigera', had criticized one of J. McNeill Whistler's paintings, and, among other things, had said: "I have seen, and heard, much of cockney impudence before now; but never expected to hear a coxcomb ask two hundred guineas for flinging a pot of paint in the public's face." In the course of the trial Whistler made his famous statement of the basis on which a professional man should be paid. He was asked how long it took him to paint a nocturne of Battersea Bridge for which he expected 200 guineas; he replied "about a day." "Only a day?" asked the cross-examining counsel. "Well, I won't be positive; I may have put a few more touches to it the next day . . . I had better say then, that I

was two days at work on it." "Oh, two days!" exclaimed counsel, "The labor of two days, then, is that for which you ask 200 guineas?" Whistler replied: "No; I ask it for the knowledge of a lifetime."

NO further supplies of arms and ammunition are to be exported from the United States into Mexico. This embargo went into effect on August 15. It is a great mistake to have permitted the exportation of rifles and cartridges into Mexico during the revolutionary period, for it has been a direct means of continuing both civil war and banditry. The dismissal of Mr. William Cummings, the British chargé d'archives, by President Carranza is another sign of the times. We hope that it may lead to joint action between England, France, and the United States in bringing the Mexican government to a realization of its international obligations. At the moment of going to press the capture of two American Army aviators is announced, with the statement that a ransom of \$15,000 is demanded by the bandits into whose hands they have fallen. Events are moving to a new crisis, which this time, we hope, will lead to salutary action.

DURING the week the engineers of San Francisco have had an opportunity of meeting Mr. Van H. Manning, and they were glad to avail themselves of it. The Director of the U. S. Bureau of Mines won respect for his loyalty to his predecessor and former chief; he has proved that he can awaken similar loyalty in his own staff. During recent years, and particularly during the War, the Bureau of Mines has gained greatly in prestige and its Director has gained the goodwill of the mining public by his evident ability to make the Bureau helpful to those engaged in winning the metals from the crust of the earth. While in San Francisco Mr. Manning sounded a note of warning, pointing to the fact that the United States is consuming more oil than it is producing, so that the domestic output has to be aided by imports from foreign regions. Whereas we have used only 1% of our coal resources, we have already used 40% of our natural reserves of petroleum. Meanwhile England and Holland have gone to work to win control of oil supplies all over the world, notably in Mexico. It is not unlikely that the need of obtaining oil from Mexico will become an important factor in determining our policy toward Mexico, because the establishment of friendly relations would help greatly in assisting the legitimate participation of Americans in developing the Mexican oilfields. We quote Mr. Manning more fully on another page.

THE President is an eloquent speaker; he is famous as a maker of phrases; but as a writer of formal letters, of condolence or congratulation, he seems to have no better luck than the rest of us. His introductory phrase, 'May I not', has been worn to a frazzle, as his late distinguished opponent would say, even if it be defensible on literary grounds—which is doubtful. In his recent message of sympathy to Mrs. Carnegie he used it again, suggesting an obstinacy that must have sur-

vived the protests of his friends; for we feel sure that many of them must have remarked upon this idiosyncrasy. The story is told that a journalist on the 'Olympic' catching sight of the 'George Washington', and knowing who was on board that famous ship, exclaimed: "There goes the 'George Washington', making 30 may-I-nots per hour." We venture to hope that ere long Mr. Wilson will find a less stereotyped phrase for beginning his official greetings of joy and sorrow. Speaking of Andrew Carnegie, we note that he is said to have desired his epitaph to be: "Here lies a man who knew how to enlist in his service better men than himself." This is not exactly what he said. In October 1904, on the occasion of a meeting in New York of the British Iron and Steel Institute, of which he was president that year, Carnegie made a speech, and in closing he expressed the hope that his epitaph might be: "Here lies a man who knew how to get around him cleverer men than himself." He waited for the applause, and it came. When hearing him express his modest wish, we thought it might have been phrased thus: "Here lies a man who knew how to get around cleverer men than himself," for we recalled the fact that he started his career as a money-maker by persuading Edgar Thomson, of the Pennsylvania Railroad Company, into granting him a quarter-cent rebate per pound of coke. On such shrewd beginnings are great fortunes built. Carnegie made Thomson famous by naming his steel works after him. However, there is this to be said, that Andrew Carnegie's epitaph acknowledges the spirit of co-operative effort by which big things are accomplished; it recognizes the fact that a man who plays a lone hand plays a losing game, and that the captain of industry will fail in achievement unless he can arouse the enthusiastic loyalty of his fellow-workers.

The Treaty and the Covenant

The applause that came from Mr. Lodge's followers in the gallery of the Senate and the jeers with which the same claque received the replies of those who countered his attack on the League of Nations will deceive nobody into the belief that the Senator from Massachusetts voices the preponderant sentiment of the country. It was an exhibition of bad manners; that is all. The subject is far too serious to be treated in this way. Neither the noisy demonstration in the public gallery of the Senate nor the bitter personal attacks on the President himself will suffice to mislead the bulk of thoughtful people in this country into a hasty repudiation of the agreements made by their representatives at Paris nor drive them into a refusal to ratify a compact that is the outcome of long and careful deliberation, and that in the end may prove to be the only means of amending a treaty the terms of which will need the interpretation of such an international court as the covenant of the League provides. Unfortunately the discussion of an international settlement of the affairs disrupted by the cataclysm of war is prejudiced today by the injection of political bias and personal animosity. The Covenant instead of being

regarded as a possible life-raft for the world's safety during storm has become a platform on which politicians hope to step to power. The personal reputation of Mr. Wilson is a small matter as compared with the success of an effort to end this war and to prevent more wars. The political ambitions of his opponents are even less important than the fame of the President if only the world at large, and this country in particular, can be guided wisely into an agreement likely to protect civilization from another assault of militant barbarism, from Germany or elsewhere. The preponderance of public opinion is this way, we believe. Straw votes and questionnaires all over the country indicate unmistakably that from 80 to 85% of Americans today are in favor of the ratification of the Covenant. They are right in their instinct to see the Treaty buttressed by the League. From the noisy claque in the Senate gallery we turn to the sadly wise and deeply serious statement made by General Jan Smuts at the time when he signed the Treaty of Peace under protest. General Smuts is not a European; he belongs to one of the democracies overseas; his point of view is sympathetic with ours in many respects; he has proved himself a gallant soldier and an able administrator; he is a man to whom we can give respectful hearing without losing any self-respect. To him the Treaty is not a satisfactory document, but he signed it because he realized that it was "imperatively necessary to end the war" and "nothing could be more fatal than the continuance of the state of suspense between war and peace." He believes that "the real work of making peace will only begin after this treaty has been signed, and a definite halt has thereby been called to the destructive passions that have been desolating Europe for nearly five years." He looks for a change of heart, for a spiritual revulsion that will evoke "a new spirit of generosity and humanity, born in the hearts of the people in this great hour of common suffering and sorrow." The Treaty, however, records two great achievements: "The one is the destruction of Prussian militarism; the other is the institution of the League of Nations." General Smuts is confident "that the League of Nations will yet prove the path of escape for Europe out of the ruin brought about by this war. But the League is as yet only a form. It still requires the quickening life which can only come from the active interest and vitalizing contact of the peoples themselves. The new creative spirit, which is once more moving among the peoples in their anguish, must fill the institution with life and with inspiration for the pacific ideals born of this war, and so convert it into a real instrument of progress." He concludes with these words: "Our Allied peoples must remember that God gave the overwhelming victory, victory far beyond their greatest dreams, not for selfish ends, not for financial or economic advantages, but for the attainment of the great human ideals for which our heroes gave their lives." These earnest words have been read with keen sympathy by many of our people, who, with millions in Europe, in Canada, and in Australia, as in France and Italy, see in the Treaty, with the Covenant, a hopeful approach to

reason and justice. Both documents have defects; both contain clauses we would like to change; but no international agreement covering so complex a set of political conditions could be devised to please everybody; if we ask for changes, the other countries will ask for them also, and the whole controversy will be re-opened. The League is the ultimate reconciler of the difficulties growing out of the Treaty; the Covenant is elastic in many respects and is open to modification as circumstances arise. It is a movement toward the democracy of the nations and an attempt to establish a means of preventing the suicide of civilization. "It assumes," as Dr. Lyman Abbott has said, "that there exists in democratic peoples a real though imperfectly developed spirit of mutual trust and confidence." It has received the approval of the able and experienced statesmen of many countries, as well as of our own, and they have accepted its terms not without many surrenderings of minor points of difference. The controversy that was waged so long at Paris is being reproduced in a provincial way at Washington, complicated there not only by the larger issues of international rights but by the smaller incidence of domestic politics. Cannot our legislators make sacrifices of personal prejudice, even of national desires, for the sake of the great consummation for which the War was fought by the embattled democracies of the world? A few months ago as a people we took a solemn oath that so far as lay in our power we would prevent a repetition of the horrors of a world war. The barriers of time and space have been so conquered by man that any future war is likely to embroil all of us, as in the dark years just past. Have we so soon forgotten our stern resolve? There are millions of plain people who have not forgotten, and it is their impulsion that has compelled even the most fiery nationalists of the Old World to compromise with the demands of their diplomatic opponents in order to reach a practical result. Shall the New World show a smaller tolerance or a lesser generosity? Shall the dead go unrequited and all the suffering of the hideous years remain unrecompensed? Must the bitter lesson be learned again and mankind be exposed anew to another pentecost of calamity?

The Cost of Living

This is the all-absorbing subject today; and it is well that it should be engaging the attention of all earnest men, for the incidence of high prices on the necessities of life is causing an irritation that may readily engender political unrest of a most dangerous kind. The world is in an ugly mood just now, for the lofty idealism and national solidarity of the critical days of a great war have been followed by bickerings among the allied belligerents and by jealousies among their peoples. An unlovely state of mind is discernible in the criticisms and detractions leveled by various nations against each other and in the eagerness shown by each to claim credit for what they did in behalf of their joint cause during the years of stress. Likewise the mass of the people, no

longer under the impulse of a high emotion, are inclined to growl at the cost of the War and are chagrined to find that the successful ending of it has had so little effect in lightening the personal burden of taxes and abnormal expenses. The Administration is wise in directing its best efforts toward the mitigation of conditions that if not intolerable at least have the effect of making the average citizen intolerant. The Attorney-General, who is named as a likely candidate for the Democratic nomination to the Presidency, is astute in taking a prominent part in the Government's campaign to stop profiteering and to investigate the reasons why it flourishes unchecked. In the latest issue of the 'Analyst' we find a plaint from a salaried professional man, who shows that he was more fortunate in 1914 when earning \$2600 per annum than in 1918 when he earned \$3244. He lives in New York. In 1914 he had no premonition that the killing of the Archduke at Serajevo would start events the effect of which would be to cut the value of his salary in half. In 1914 he saved \$720; in 1918, only \$359. A tabulation of the cost of meals shows that he breakfasted for 38½ cents in 1914, as against 70 cents in 1918. His dinner in the first year of the War cost 69½ cents, whereas in the last year it cost him \$1.36. Such comparisons will be appreciated by the average professional man, especially by those in receipt of fixed salaries. When the man that plies the wheelbarrow from the concrete-mixer receives \$6 per day, the hod-carrier \$7, and the bricklayer \$9 per day, in each case an increase of 100% since 1914, one feels sympathy for the university professor who has obtained no increment on his salary of \$3300 per annum and for the Government geologist who is receiving the \$3000 that he used to get five years ago. These are men of unusual ability and exceptional character, with years of experience behind them, yet their pay is only that of a skilled laborer. On the other hand, the younger professors and scientists receive anything from \$1800 to \$2500 per annum, which is about equal to that of the common laborer. It is a serious matter to a civilization such as ours when the very leaders of it are made impecunious, and when manual labor is able by truculent methods to assist itself so much more effectively as to win increases of wages that are denied to the gentler exponents of education. What is true of them is true in large measure of engineers; their salaries have been raised, but not so much proportionately as the wages of the men whose work they direct. They have fared better than the educators and scientists because they are closer to the classes whose collective bargaining has given them a whip-hand over the employer. If the engineers, among whom we include technicians generally, are unable to obtain just recognition from the corporations, it is not unlikely that in self-defence they will unionize themselves, a step that we would regret in so far as it might have the effect of diminishing personal initiative and individual efficiency. It must be realized that the persistent demands by labor for higher wages and for a voice in the administration of industry have become

identified with the theory of a limitation of effort and the expectation of increasing the total employment. This is a most pernicious result and one that is largely responsible today for diminishing productivity. Mr. Herbert Hoover made this point in a recent published statement. At the same time he laid emphasis on the fact that the democratization of industry, which was rendered necessary during the War in order to obtain a maximum of co-operative effort, is now a real menace to the world, because it has caused a marked decrease of productivity since the stimulus of the War itself has been removed and has awakened dreams of gaining an easy living while diminishing the amount of personal effort among the workers. He warns us against the complacent assumption that the dominating financial position of the United States is an unmitigated benefit to this country, because the credits we are giving to the European countries are simply an advance against commodities in exchange, and credit will collapse unless such commodities are forthcoming; in short, if the credits are used for more than a temporary purpose, the effect of them will be to bring Europe under economic subjection to the United States and into a position so intolerable that the only escape ultimately would be war between Europe and this country. Here we suggest that the lending of huge sums of money to the Europeans where-with they can buy American goods at inflated prices has the effect not only of over-burdening the countries lately at war, our own Allies included, but it enables the American producer to establish an export price that serves as an excuse for exorbitant prices at home. The mere threat of Government action has caused a drop in current prices of staple foodstuffs, and the inquisition started by the Attorney-General is putting the fear of the law into the hearts of the profiteers. But this will not suffice to lower the cost of living. It may be accentuated by profiteering, but it is due basically to the destruction of material and of labor by warfare; we have drawn millions from labor to soldiering, and even though they have doffed their uniforms they have not yet resumed their economic function as producers. Meanwhile the enrichment of this country, exaggerated by a superfluity of paper money, has incited an extravagance that is almost riotous in its exuberance. Sumptuary laws may be distasteful, and most of us are tired of restrictions upon our personal habits, but the time has come for the press and the pulpit to condemn and satirize the drunken spending of the vulgar rich, and to teach the simpler and saner ways of living that are consistent with the democratic ideal. Things are high in price because, among other reasons, people insist on having them and are willing to spend money freely in getting them. So long as everybody is willing to buy articles at fancy prices, the retailer can afford to share a handsome profit with the middleman. The manufacturer, in turn, can purchase his raw material at any price and pay higher wages with equanimity. It is a vicious circle of uneconomic blundering. Thrift, personal and national, accompanied by increased productivity, is the cure for the high cost of living.

Authority and Brains

The Editor:

Sir—Apropos of your editorial on 'The Engineer as a Citizen', appearing in your issue of July 5, I venture to submit the following:

While the War was in progress a certain poster was displayed throughout this country. It had the picture of a soldier and beside it the picture of a workman; underneath was an inscription something like this: "These two will win the War". There should have been a third picture showing 'Brains' set between these two, and the inscription should have read, "These three will win the War". It was not put there probably for the reason that Brains designed the picture and was modest, or else it was taken for granted that Brains would do all he could and did not need to be urged to give the best he had.

This picture is typical of the attitude of our Government officials and, in many cases, of our industrial corporations. Now, as between Capital on one side and Labor on the other, there is a group of persons who do the thinking, plan the operations, and see that the plans are carried out.

The first capitalistic class of any prominence in America was the thrifty New Englander. Among the first large ventures of capital were the American railroads. It was not possible for all the owners of any one corporation to assemble together and direct the operations of that corporation; instead, certain men were elected to represent the interests of groups of investors and these men, while they also were investors, became the paid representatives of capital and joined the ranks of the workers in that they received a remuneration for the work they did. They stand at the head of the class that represents the Brains of the operation. These men united together and employed others, and so on down through the line to the foremen and shift-bosses. These latter may be considered at the bottom of the ladder of brain-workers.

The success or failure of an undertaking in the great majority of cases depends, not on the natural advantages that are being capitalized, but on the brains that are directing the spending of the money. Different types of organization may accomplish the same successful end, but all must recognize that to be effective the organization must have authority delegated to the different members. This question of authority and where it is vested is the stumbling-block over which our industrial system seems

to be having its greatest trouble just now. At one time it was considered that the man who was promoted from the ranks of labor to be a shift-boss, thereby lost his right to belong to the laboring classes. In those days a shift-boss had the authority to discharge a man under him. He might or might not have had the authority to employ, but the moment he was given the authority to discharge he lost his standing in the councils of labor. In other words, his judgment had been recognized and he had been taken into the ranks of Brains.

Why was there any need of shift-bosses anyway? When an enterprise grew to such a point that the foreman could not watch over all the work he had to have assistance. He needed men on whose judgment he could rely to see that the details of the work were carried out correctly and that the safety of the men was secured. In the more modern organizations it has been deemed wisest to take away the authority formerly given to the shift-boss, and now he cannot discharge men. This looks as though the shift-boss had not made good; but he is in good company, for the same authority has been taken away from foremen and even superintendents—and it is beginning to look as though managers, yes, and even presidents, did not have the authority to discharge men.

What has happened to cause this change? One answer is offered, which is, that organized labor through its influence over large groups of laborers has recognized that it could do better with men higher up than it could with foremen and shift-bosses, and so it has gradually moved up through the organization and now instead of going to the shift-bosses, it goes to the president, if he is willing to take away the authority of the manager, or to the manager if he interferes with the superintendent. Organized labor is now passing this stage and is going over the heads of all, to the highest authority in the country, the President. It will only be a short step to the head of the League of Nations. And yet there are a few of us left who believe that the old way was the right way and that the general should not give orders to the private direct.

It may be that the class called Brains is wrong, that it should not have any authority, but if this is a mistake, then after we have passed through a crisis of failures and terrible hardships, we shall start again with authority in its right place.

If all Labor unites then the only recourse is for Capital and Brains to unite. Germany might have won, and it looked as though she would have won, if the Allies had not united under one head. Germany typifies autocracy.

Our laboring men must be careful lest they find themselves backing an autocracy.

There is one way out; there may be several; there is the democratic system of having representatives of Labor meet representatives of Capital and of Brains, and then decide each case on its merits.* These representatives should only represent the one enterprise in which they are interested; and the first meeting of such representatives must define and agree upon a system of organization; also they must define authority. When authority has been placed, then let Brains, Capital, and Labor respect that authority.

"No man can serve two masters" is as true today as it was when Christ said it nearly two thousand years ago. I was sitting in a small railroad station talking to the agent, who also acted as transmitter of messages for a telegraph company. He had just refused to accept my message. I asked him who ordered him not to accept telegrams and he replied that he had a letter from the president of the Order of Railway Telegraphers telling him not to accept any more until notified. I asked him for whom he was working. He replied the railroad company. I asked him if the railroad company had ever cancelled their instructions to him to accept messages. He replied they had not. I asked him if he realized that he was working for the United States government and disobeying orders by not accepting my message. He had not thought of that. I asked him if the railroad official who usually gave him orders instructed him to accept messages at his option. He did not believe such instructions would be given. Was he satisfied with his treatment by the railroad? He was. Did he know anything about the officials of the Order of Railway Telegraphers? He did not.

What more is there to ask?

There is something more vital to the difficulty, but it was not asked directly—although the answer was easily gathered from subsequent conversation. Did he want to strike? He did not. Would he strike? He might have to. Why? Because if he did not—well, he was afraid; he had a wife and dependents; something might happen.

Is this man living in a democratic world or in an autocratic world?

Who is he working for, the railroad company or the union?

Whose authority does he recognize, the United States government or the union official?

Let each man answer for himself which of the two masters he will serve.

This question of authority has been badly abused by the upper stratum of the class called Brains, and probably if the world but knew it, it is that part of our organization that has caused the banding together of the laborers into large unions. The directors of an organization usually are not familiar with working conditions and the actual touch between their representatives and labor. They have not passed sufficient authority from themselves to their representatives in the field, with the result that those representatives do not feel that they

can decide without consultation higher up, and they "pass the buck". After a few such passes Labor feels that it is useless to treat on the ground and it also goes higher up. What has been the result? Those higher up decide one question and authority is broken down. Thereafter they must continue to decide. The mistake is made, they have broken down their organization, they have admitted a loss of confidence in their representative, and it cannot be expected that others will place confidence where they have none. The mistake of one such breach of authority makes it hard for many other enterprises that are working correctly. The man between is also often to blame, although it takes a strong man to say to those higher up, "Stop! you are breaking my authority." It is much easier to pass the buck than it is to fight out the problem and win or lose.

With authority must go the most important thing in our relations with one another and that is confidence. Authority should be given only to the extent covered by the confidence those having authority feel for the recipient of the authority. It is this lack of confidence that makes cowards of us all. Confidence comes only through close association with each other. Where there is confidence there is authority; without confidence, authority is a hollow staff.

Every man enjoys working with an organization where authority is definitely established, where each has confidence in the other, and where orders can be given and obeyed without question as to the whys and the wherefores. Every American likes to feel that there is a chance for him to reach a position of authority.

The important thing to remember is that we must respect authority both coming and going. It is easier to respect the authority coming from above than to respect the authority we have delegated to our subordinates.

The American laboring man has received the highest wages paid anywhere in the world. He had more independence than any other worker. He respected the authority of the Brains that led and directed his work. Let him halt and consider carefully which master he will serve. And let the employers of labor consider carefully whether they have given labor a square deal both in the wages they have paid and in the prices they have been and are exacting from the people for the product of the united efforts of Labor and Capital. Both must be brought to see that authority has been given Brains, and both must respect that authority.

Concerning a Definition

The Editor:

Sir—"Which is the best, if one wants to be useful and to be really understood, to get one's words in the world, or to get them in the schools? I maintain that the good plan is to employ words in their popular sense rather than in their philosophical sense; and the better plan still, to employ them in their natural sense rather than

in their popular sense. By their natural sense, I mean the popular and universal acceptance of them brought to that which in this is essential and invariable. To prove a thing by definition proves nothing, if the definition is purely philosophical; for such definitions bind only him who makes them. To prove a thing by definition, when the definition expresses the necessary, inevitable, and clear idea which the world at large attaches to the object, is, on the contrary, all in all."

So said Joubert, who was concerned with the French language as a medium for metaphysics, but with a lively recollection of the 'Ore' controversy, and in view of John Wiley & Sons' announcement, I respectfully disinter his words after a hundred years.

R. T. HANCOCK.

The Crowe Process

The Editor:

Sir—I am constrained to write a few remarks after reading the presidential address by Mr. Hugh K. Picard, delivered before the recent meeting of the Institution of Mining and Metallurgy, so liberally printed and commented on in your issue of July 5.

My initial point of criticism is found at his reference to the vacuum, or Crowe, process of de-aerifying pregnant cyanide solutions of gold and silver preparatory to the precipitation of their bullion content by means of zinc, either as dust or shaving. I do not controvert the utility of the process, because I believe in its efficacy. But I deny that it is a new discovery and a novel invention within the requirements of the patent laws of the United States of America. It has been stated that it is a belated discovery of an existing quality, and as such is entitled to recognition as original.

The basic principle, the process, and the apparatus have long been known and used in the same metallurgical line at many times and places by many people many years before application for a patent thereon. Hereinafter I will cite a number of them. The process is based upon the long and well known fact that gold is not soluble in either potassium or sodium cyanide solutions unless free oxygen, as in air, be present in the solutions. Oxygen is an essential constituent of cyanide solutions used for dissolving gold from ores, and its absence is equally desirable when the dissolved gold is to be precipitated.

The reasons for the above-mentioned conditions are treated at length by me in a former paper.¹ They are also set forth in Crowe's paper on the process.² Discussion of the Crowe paper by J. V. N. Dorr, A. L. Blomfield, G. T. Hansen, G. M. Taylor, and G. H. Clevenger should also be read.³ Various opinions were expressed.

In Julian and Smart's 'Cyaniding Gold and Silver

Ores', second edition, 1907, on page 35, is an illustration and description of an apparatus for removing cyanide solution from ore-pulp that has been treated simultaneously separating air therefrom before passing to precipitation. On pages 56 and 57 of the same publication are descriptions of methods and apparatus used for filtering and, incidentally, removing air from cyanide solutions. Brunton patented in 1893 a filter for drawing solution from pulp, and air from the solution by the one operation. Various other filters having like operating qualities were invented long prior to 1916.

In April 1907, Mark R. Lamb described, in a paper⁴ on the 'Cyanide Plant of the Combination Mines Co., Goldfield, Nevada,' shown by Fig. 7, an arrangement for taking air from a cyanide solution, while filtering, by using a dry-vacuum pump exhausting air from a vacuum-chamber through which the solution is drawn from the filters, and discharged by the suction of a barometric pipe.

In March 1919, Tweedy and Beals described⁵ apparatus used at the Minas del Tajo, Sinaloa, Mexico, in words as follows: "The air and solution from the sections go to a chamber that is connected to the wet and dry-vacuum pumps. Here the solution and air are separated, the wet-vacuum pump being connected to the base of the chamber, and the dry-vacuum pump to the top."

In October 1911, in a paper by Charles A. Chase, entitled 'Notes on Liberty Bell Mine, Colorado', he remarks.⁶ "The greatest single improvement in this plant was the change from the common wet-vacuum pumps to a combined dry and wet-vacuum system, in which all entrained air is taken out of the upper end by a dry-vacuum pump, and all solution at the lower end by centrifugal pumps. The diagram, Fig. 12, shows the arrangement."

In September 1915, in an article describing the mill at Wonder, Nevada, E. E. Carpenter said: "A dry-vacuum is used and the solution removed from the receiver between the filters and the dry-vacuum pump by a small triplex pump." He further said that this equipment saved 0.23 lb. of cyanide per ton. But he ascribed this saving to other items than the removal of air.

No doubt more extended investigation would find more of such anticipations. In the arts means of separating air, or gases, from liquids have been known and used for many years.

In view of the foregoing it may be asked: Why were claims such as the following sample ones granted by the U. S. Patent Office⁸ on an application filed July 3, 1916?

"4. The process of precipitating material from its solution which consists in subjecting the solution to a vacuum and precipitating the material from the solution.

"14. In an apparatus for precipitating material from its solution, a closed chamber receiving the solution, and

⁸U. S. patent, No. 1,281,249, October 8, 1918.

means for creating a vacuum in said chamber to remove from the solution gases which interfere with precipitation.

"29. The process of precipitating valuable metal from metal bearing cyanide solutions which consists in removing from the solution gases which interfere with precipitation and subsequently precipitating the valuable metal therefrom by flowing the solution in contact with a metal capable of precipitating the valuable metal from solution."

The above are three in 31, wherein an ingenious patent solicitor 'rings all the changes' he can devise in making combinations of details, essential and otherwise. Permutation is the arithmetical term.

The answer, in part, is made plain by reciting the following incident: Some time ago, while engaged as an expert for the defendant in a suit for alleged infringement of a patent for a process of cyanidation of gold and silver ores, and while engaged in investigating the prior state of the art, I found in the library of the Patent Office a book descriptive of the art involved, and published some three years before the date of the application for patent, a full description of the method covered by the patent in suit. When I brought this to the attention of the Examiner who passed upon the application for the patent, he said that if he had known the prior state of the art as shown in the book the patent would not have been granted. In justification of his position he further said that the practice in examination was confined to consideration of the patents that had previously been issued by the United States, Great Britain, France, and Germany, without reference to the technical publications in the art involved. This procedure was caused by the limited number of examiners and officials, which limitations were due to the paucity of appropriations made by Congress for sustaining the business of the Patent Office; coupled with the presumption that such prior discoveries and inventions had been patented in at least one of those countries. The suit was lost by the complainant. Many thousands of dollars were thus unnecessarily expended by both parties to the suit.

On March 14, 1895, I read in London a paper^o relating to cyanidation. Among the six persons who took part in the discussion were Hugh K. Picard and J. Swinburne.

Mr. Swinburne remarked (quite apropos to the present claim that Mr. Crowe was the first to recognize the deleterious presence of air): "We have to compare two methods. In one, zinc shavings are used to deposit the gold by simple substitution. This seems simple, but we are told that the solution of zinc, and, with it, the consumption of cyanide is excessive. I would suggest that this extra consumption is due to access of air, or dissolved oxygen, and might be prevented."

Mr. Picard stated his belief that cyanate of potassium is a solvent of gold; but was corrected in that belief by Mr. Swinburne.

Mr. Picard 'boosted' the use of bromine in cyanidation in language as follows: "I think the term 'cyanicide' is used wrongly. If Dr. Keith had been fully acquainted with the recent researches of Mr. Sulman on the action of Bromine he would not have called bromine a cyanicide."

Dr. Keith replied: "Though not 'fully acquainted' with the researches of Mr. Sulman on the action of bromine, I know enough of it to reiterate my belief as stated."

It is not necessary to state which party was right, as subsequently developed in practice of the art.

The art of cyanidation was born in empiricism, and empiricism has pervaded it, though in lessening and lessening degrees, to the present day. In that respect it has not differed in kind from various other arts and derived sciences. Modern chemistry is like growth from ancient alchemy. In the growth of the art many kinds of apparatus and methods of using them were devised, experimented with, operated, and then discarded for others; not always holding fast to that which was good. Suitable recognition was frequently given to effective methods and apparatus, and other applications were also lauded, and then abandoned for some new fancy, without arriving at any settled judgment. To err is human. We have all erred, and the best we can now do is to acknowledge our errors, plead imperfect knowledge at the crucial time, and promise to do better as fast as we learn how so to do. For the general good, both of laity and profession, error should be pointed out, though not in a captious spirit. Hence the foregoing.

N. S. KEITH.

Philadelphia, July 14.

[In accord with our policy of giving free scope to criticism in technical affairs, we print this letter from Dr. Keith, but we do not find ourselves in agreement with his contentions. The general idea of de-aerifying cyanide solutions preparatory to precipitating their gold and silver contents may have been recognized vaguely in the literature of the subject but the application of the idea to milling practice, specifically by removal of the dissolved oxygen by means of a vacuum, is quite another matter. Dr. Keith quotes a number of metallurgists, all of whom took part in a public discussion of the Crowe process in 1918, whereas the application for patent was made by Mr. Crowe on July 3, 1916, as is shown in the copy of the patent which Dr. Keith was good enough to send to us. Professor Clevenger, in the discussion before the Institute, stated that the Crowe process was "a distinct new development in cyanidation." He added: "After reading the paper, it occurred to me that some of us had done practically the same thing some time ago but without design and unconsciously." Very likely; lots of ideas wander disconsolately in our craniums just because we fail to co-ordinate them with other ideas so as to obtain concrete results. We note in the latest annual report of the United Eastern Mining Co. that "a decrease of nearly 50% in the consumption of zinc-dust" is being

^o'Electrolysis of Gold,' Jour. Proc. Inst. Elec. Eng., Part 117, Vol. 24, p. 236, 1895.

made by use of the Crowe process; we understand also that this company, together with others, has caused a careful search to be made into the patent records before entering into a contract for the use of the process on a royalty basis. Dr. Keith's criticism will be noted in due course by the legal advisers of other companies and they will ascertain for themselves whether his contentions are well founded or not. While we agree in the main with our correspondent as to the defects of our patent system and the deficiencies of the staff at the Patent Office, as will be found by referring to the editorial on this subject in our issue of July 26, nevertheless we are not disposed to fight every patentee in order to prevent him from being rewarded for his ingenuity; and we trust that our fight against Minerals Separation is not so interpreted. We do oppose excessive royalties, tyrannic imposition, and crude attempts to exercise monopolistic control; that is far different from opposing the bestowal of a reward on successful inventiveness in the arts of mining and metallurgy.—EDITOR.]

War Minerals Relief

The Editor:

Sir—Commendation is in order because of your expressions in the issue of August 2, relative to War Minerals Relief and the ruling of the Attorney-General.

The questionnaire issued under the provisions of the Relief Bill included this query: "What induced claimant to undertake the production of any of the above mentioned minerals?" To this inquiry doubtless many varied replies were made. Some claimants possibly were led by their patriotism alone, others by a combination of desires, in which the financial admittedly was not the least; but in any case the scale was tipped by the fact of the Government's established prices for these war minerals. If these prices were not public notice, request, and invitation, what were they—an attempt to deceive?

You say personal request or demand by the Government was not possible, in all cases. That may be, but what about the personal request or demand verbally by the Government, through its officials, such as those of the Bureau of Mines and Geological Survey, chief or subordinate, it matters not which, Government officials in either case?

DWIGHT E. WOODBRIDGE.

Duluth, August 7.

The Quicksilver Industry

The Editor:

Sir—In your issue of August 2, Mr. William Forstner calls attention to a contribution made to the 'Engineering & Mining Journal' by the undersigned "endorsing the policy of leaving the quicksilver industry unprotected".

Quite to the contrary, I should like to see this industry protected to such an extent as to make it one of the prominent metal industries of the country. The article referred to was written with the hope that it might draw out stronger arguments for protection from those in-

timately acquainted with the industry than had yet been presented. Mr. Forstner's further remarks are in line with this hope. There is, however, one point of very considerable importance that has not been contradicted satisfactorily but should be in order that the protectionists' position may be made strong.

In the various official reports that have appeared stress is laid upon the fact that the grade of ore treated in this country has been, for several years, growing lower and lower with no hope of improvement in this direction. That consequently the industry is a declining one which no reasonable protection will bring into activity again, and it may be expected that instead of any permanent or gradually diminishing protection being adequate it will be necessary to continually increase this protection. If those who are personally acquainted with the quicksilver resources of this country can refute this assertion with proof of the existence of substantial supplies of commercial ore they will add one very substantial argument for the protection desired.

F. F. SHARPLESS.

New York, August 8.

TESTS of the heating values of fuels have become of great commercial importance, as practically all coal sold on large contracts is paid for on the basis of the heating value found in the tests conducted by or for the purchaser. The instrument used for carrying out this test is the bomb calorimeter, which comprises a strong steel cartridge or capsule with removable cover, adapted to contain a small charge (about 1/30 ounce) of coal. The bomb is tightly closed and oxygen is introduced under high pressure. It is then put into a vessel containing a measured quantity of water and the coal ignited electrically, the heat generated being absorbed by the water. The quantity of heat liberated in the combustion of the fuel is then calculated from the rise in temperature of the water. Important aid has been given in the standardization of the testing of coal for calorific power by the issuance by the Bureau of Standards of samples of materials with accurately known heat values, which afford a simple, precise, and convenient means by which the user of the calorimeter may check up the accuracy of his own determinations.

A RECENT DISPATCH from Ottawa gives the details of proposed legislation providing for Federal aid to technical education in Canada. According to the terms of the bill, which is sponsored by Hon. J. A. Calder, Minister of Immigration and Colonization, annual grants from the Federal government are to be made to the several provinces on a population basis and are to be applied to purposes of technical education by the provincial authorities. The terms of the bill provide for Federal approval of provincial plans for the utilization of annual grants and it may be hoped that recommendations of established Canadian technical societies will receive due consideration when plans are being developed for the extension of technical education under the proposed legislation.

The Mining Department of the A. E. F. University

In the group of schools established by the Y. M. C. A. at Beaune and corresponding somewhat to the Khaki University of Canada, the mining department was by no means large. The fifty odd students were a mere handful compared with the regiment interested in gas-engines and automobiles, but the quality of the students was high. The faculty included Dr. A. C. Lane, recently chairman of the Boston section of the A. I. M. E., and Capt. H. C. Ray, of the University of Pittsburgh, both of whom are as well known in America among scientific men as among mining men. The teaching work of the officers detailed, often against their wish, for the purpose was good. Among them we may mention Capt. Hugh Archbald, of Scranton, one-time editor of the 'Colliery

complete plant of the Epinac coal mines, involving a coal-washer, a briquetting plant, and a central power-plant, and to go underground and see the French system of mining thick seams. They saw something of the oil-shale that is mined and distilled around Autun. Another beautiful and interesting trip was to the mine of fluorite at La Petite Verrière, on the invitation of the owner, M. P. de Champeaux. The beautiful greens and purples of fluorite made an attractive dump. Mines of iron ore near Nolay, not now working, were also visited.

Besides these mines, there were numerous quarries and exposures near-by, where one could see phosphate and chert nodules, collect fossils, study replacement of oolite by iron ore, and get the idea of the structure by which

MINERALOGY CLASS AT WORK

Engineer', a graduate of Yale and Columbia, Capt. H. C. Vail, Capt. E. C. Dietrich, Corporal J. E. Rypinski, another Columbia graduate. Textbooks and apparatus were scantily supplied during the brief three months of the school's existence, so that the teachers had to emphasize their personal experience.

Fortunately, however, the French generously loaned minerals and rocks enough to give the instruction in these lines a practical character. Surveying instruments were available, so that mine-surveying could be taught. The gypsum mine at St. Gilles near-by was used by Capt. Dietrich's class in mine-surveying. Beaune was well situated to supplement the work of the classroom by practical outdoor work. Students on leaving were able to say that they had got much from the courses and this was due probably largely to these trips. The students were received with every courtesy at the great plant of the Schneiders at Creusot. They had a chance to see the

the citizens of Beaune, situated on the Pliocene top of a down-faulted rift-block near the margin, can see the Jurassic escarpment of the Côte d'Or dominating their town, while a short distance westward, the Paleozoic and the granitic massif of the Morvan is brought to the surface.

Accordingly, before the term ended a museum of specimens, including all the important classes of rock, from basalt to granite, from quartzite and gneiss to shale and limestone, and most of the common minerals, had been collected by the students themselves on the various excursions.

INVESTIGATIONS in South Lapland seem to show that valuable copper veins have been found, especially in the upper part of the Vilhelmina district (Dikanar and Farmomakke, although at present there is no information as to their richness.

J. E. RYPINSKI, H. C. RAY, A. C. LANE, E. C. DIETRICH, HUGH ARCHBALD

THE MINING COLLECTION OF THE A. E. F. UNIVERSITY

An Unusual Apex Case

By R. T. WALKER

*With all its fruitage of waste and obstruction, litigation and blackmail, the apex law has been productive of some good which otherwise might not have been accomplished, in the fact that the development work which has been done to clear up disputed points has not infrequently led to the discovery of previously unsuspected orebodies, and that much advance in geologic knowledge has resulted from the close study made of veins and lodes in connection with mining litigation. An instance in point is the contest between the Square Deal Mining Co. and the Colomo Mining Co., in Gilpin county, Colorado, which, because of a rather unusual type of vein structure disclosed and because of the light it sheds on ore deposition, merits more than local celebrity. The circumstance that one of the litigants was dispossessed of its most important orebody by the other in one suit, but recovered it in a subsequent action—foiling the villain in the last act, as it were—lends a melodramatic touch to the story.

The vein structure and the relative positions of the Notaway claim of the Square Deal Mining Co. and the Sub-treasury claim of the Colomo Mining Co. are indicated on the accompanying cross-section. The Notaway and Cecil veins are approximately parallel in strike, but dip toward each other at the surface. The Notaway vein, which showed bunches of rich gold ore in its outcrop, was located in 1868, and has been worked almost continuously ever since. The outcrop of the Cecil vein is barren, for which reason its location and development were not undertaken until much later. The main shaft on the Notaway vein followed the North Notaway vein below the 250-ft. level (marked *X*), without the departure of the South Notaway vein at this point or the crossing of the Cecil vein a few feet lower having been observed. It had, indeed, been noted that the rich gold-quartz ore, which made mining operations on the Notaway vein profitable above the 250-ft. level, terminated at this point, but this was interpreted simply as the ordinary bottoming of an ore-shoot, and exploration was continued in the low-grade ore of the North Notaway vein below in the hope of encountering another similar ore-shoot at greater depth. The South Notaway vein was not discovered until 1894, and then through accident. A second shaft having been sunk on the Notaway vein, it was desired to connect it with the main shaft by a drift along the vein. The second shaft, however, had unwittingly followed the South Notaway vein below the point of juncture, and as the connecting drift was started below this point, it followed the South Notaway vein and failed to connect with

the Notaway main shaft. The true situation being disclosed by a survey, a cross-cut completed the connection and demonstrated the division of the vein below the 250-ft. level. The rich ore, which had induced the exploitation of the Notaway vein, and which had disappeared from the Notaway shaft at the 250-ft. level, was now found to continue from that point down the south branch of the Notaway vein, and this branch of the vein was developed and worked down to the 950-ft. level.

Meanwhile the Colomo Mining Co., doubtless encouraged by the similarity of the dip of the upper part of the South Notaway vein with that of the Cecil vein, and believing in the identity of the two veins, sank a shaft on the Cecil vein and in 1914 broke into the Notaway workings, effecting a connection with the South Notaway vein at the point *Y*.

Litigation between the two companies, to determine title to the South Notaway vein, followed immediately. The Square Deal Mining Co. attempted to show that the South Notaway vein differed materially in character of mineralization from the Cecil vein, but its defence was fatally defective in not supplying proof of any alternative course for the Cecil vein (the continuation of the Cecil vein below the point *Z* not having as yet been discovered); therefore the Court's decision was rendered in favor of the Colomo Mining Co., which thereupon entered into possession of the South Notaway vein, and mined a considerable amount of ore from it during the following two years.

In the meantime a mortgage on the property of the Square Deal Mining Co. was foreclosed, and the mortgagee took over the property in satisfaction of the judgment. The new owner, being dissatisfied with the results of the previous suit, and being at liberty to re-open the case through not having been made a party thereto previously, filed a new suit against the Colomo Mining Co. and obtained a court order permitting exploration in the vicinity of the South Notaway vein, in the course of which a cross-cut driven southward from the South Notaway vein at a level shortly below the point *Z* cut the extension of the Cecil vein below that point, and thus supplied the missing key to the enigma.

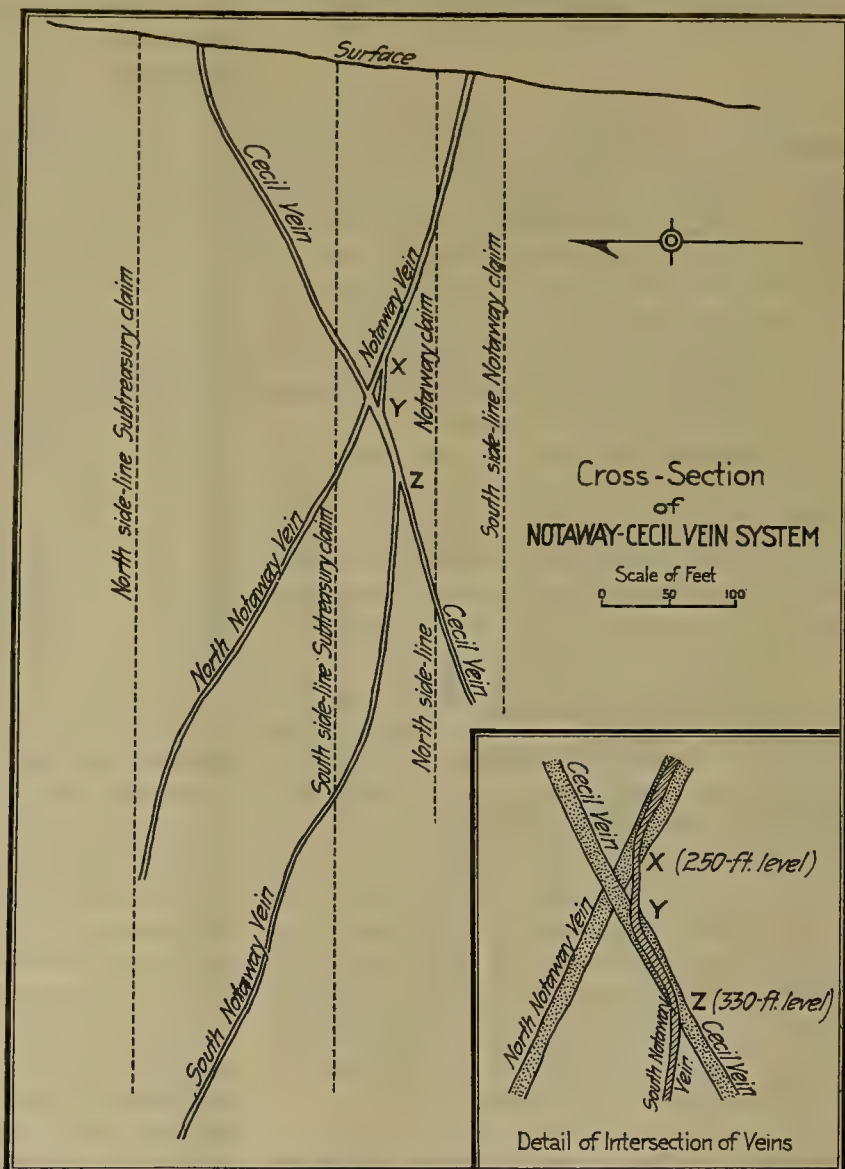

In the trial that followed it was proved that the Cecil vein, both above the point *Y* and below the point *Z*, was mineralized only with pyrite and was barren of value, having yielded no commercial ore whatsoever. The North Notaway vein below the point *X* was shown also to be mineralized chiefly with pyrite, resembling the Cecil vein in this respect, but differing from it in that the North Notaway vein did have some value in the precious

*The information on which this article is based was supplied by Charles H. Haines, of Denver, counsel for the plaintiff in the second suit.

metals. The South Notaway vein differed materially from the other two, as it contained a more or less continuous quartz seam, with which the gold that rendered this vein commercial was chiefly associated. This distinctive quartz seam accompanied the Cecil vein from the point *Z* to the point *Y*, where it broke across the angle between the two other veins at a distance of a few feet from their intersection, and, entering the North Notaway vein at the point *X* followed it thence to the surface. The conclusion drawn from the facts thus established was that there were present three distinct veins, formed at separate periods. The North Notaway vein was the oldest, as the Cecil vein broke squarely across it at the point of intersection. The Cecil vein was formed next, and probably after no great interval of time, as the similarity of the mineralization of the North Notaway vein had been effected. The South Notaway vein, while originating independently and maintaining a separate existence in depth, had evidently been deflected from its course on encountering the Cecil vein at the point *Z*, following and reopening that vein to the point *Y*, where the similarity of the course of the North Notaway vein with the direction of stress causing the formation of the South Notaway vein, as indicated by the approximate parallelism of the two veins below the point *Z*, again deflected it, so that it followed and re-opened the North Notaway vein from the point *X* at least as far as the present surface. The deposition of the distinctive and characteristic quartz seam with its accompanying gold followed, thus supplying the clue that now permits the identification of this youngest vein where it accompanies its older brethren.

From the surface to the point *X*, therefore, the Notaway vein is a compound vein, consisting of the North Notaway vein and the South Notaway vein, and displaying the mineralization characteristic of both; while from the point *Y* to the point *Z* the Cecil vein is a compound vein, consisting of the Cecil vein and the South Notaway vein and showing the mineralization characteristic of both. Corroborative evidence is found in the circum-

stance that the quartz seam is accompanied along its south wall by a post-mineral slip, which follows it around the curve between the Notaway and Cecil veins. That a post-mineral slip, tending to follow the line of least resistance, should deviate so markedly from a straight course suggests strongly that the quartz seam is to be considered as an entity separate and distinct from the Cecil and North Notaway veins, and that it occupies

the latest prior fissuring and therefore the one most readily re-opened by post-mineral stresses.

On the basis of this evidence, the new owner of the Square Deal Mining Co.'s property claimed that the South Notaway vein, although following for some distance the courses of the North Notaway and the Cecil veins in the upper part of its course, continued to be a separate entity, definitely maintaining its identity; that,

in common with the North Notaway vein, it apexed within the boundaries on the Notaway claim; and that, consequently, title to the South Notaway vein from its juncture with the North Notaway vein at X and including the portion between Y and Z, where it had a course in common with the Cecil vein, appertained to the Notaway claim, which was the senior location. The decision of the Court affirmed this contention and returned to the Notaway claim, after two years alienation, the vein and orebodies that, through the industry and at the expense of its previous owners, had been discovered and developed.

Conclusions may be drawn from this case, both as to the operation of the apex law, and for application to practical mining. While this seems to be an instance where law and equity coincided—a condition that unfortunately has failed to prevail in much of the apex litigation—it well illustrates the difficulty of applying to a problem of even but moderate geologic complexity a law which apparently was founded on a narrow and largely erroneous conception of the origin and nature of ore deposits; and it serves to show how much unnecessary expense, with consequent detriment to legitimate mining operations, may be caused by this law, and how much simpler, with equal effectiveness in rewarding the discoverer of a vein, would be the substitution of vertical boundaries for the present extra-lateral right, after making proper allowance for the lateral departure of orebodies on the dip of the vein by increasing claim-widths or providing for the location of flanking claims to cover the dip.

This case also affords a lesson as to the importance of careful investigation into the genesis of ore deposits. Too often is it assumed that the contents of a vein have been deposited synchronously, or, even when more than one period of deposition is recognized, that simple re-opening of the same fissure is sufficient explanation. Investigation may develop many similar cases where the re-opening of a portion of the course of a vein, through the formation of a later vein, which elsewhere maintains a separate identity, has caused the overlap of two distinct periods of mineralization in the common channel; and this case suggests that, where one or more valuable constituents of an ore-shoot terminate abruptly, it may well prove worth while to investigate whether a productive vein—perhaps concealed behind a slickensided post-mineral slip, which so often masquerades as a 'wall'—may not be departing at that point.

THE BLACK HILLS mining district of South Dakota produced \$6,565,209 in gold and 159,246 ounces of silver in 1918. From January 1, 1918, to October 27, 1918, the Homestake mine and mills were operated at full capacity, but during the remainder of the year the property was operated at only 71% of capacity. This property, which produces the bulk of the output of South Dakota, had not reached full capacity in June 1919. The Golden Reward mines and mill, closed in 1918, have not resumed operations.

Decreased Output of Gold in Australia

The decline in the gold-mining industry of Australia has become one of the most pressing problems of the Government, which is in constant receipt of petitions for the relief of the industry, and a movement for the granting of a subsidy of £1 per ounce on gold produced has grown formidable. Other proposals include the 'grubstaking' of returned soldiers to prospect the unexplored central and northern portions of the Commonwealth's territory, and Government loans to mining companies. The chief argument of the advocates of a bounty or subsidy and the retention of Government restrictions is based upon the great amount of paper money in circulation, approximately \$300,000,000, against which is held a reserve of only a little over \$100,000,000 in gold. The national notes act of 1910 stipulates that all notes issued above £7,000,000 shall be balanced by gold pound for pound. The legal reserve on notes up to £7,000,000 is 25%. Many financiers believe that the Government should continue its control of the gold market until the notes issued above £7,000,000 are covered by 100% gold, as required by the law of 1910. The decline in the production of Australian gold is shown in the following table, giving the production since 1899:

| Year | Value | Year | Value |
|------|--------------|------|--------------|
| 1899 | \$70,631,303 | 1909 | \$61,290,271 |
| 1900 | 65,844,324 | 1910 | 56,180,822 |
| 1901 | 70,473,557 | 1911 | 51,260,441 |
| 1902 | 71,986,062 | 1912 | 48,004,198 |
| 1903 | 79,192,164 | 1913 | 45,559,622 |
| 1904 | 76,991,064 | 1914 | 40,240,552 |
| 1905 | 75,577,422 | 1915 | 40,193,847 |
| 1906 | 71,184,283 | 1916 | 34,382,910 |
| 1907 | 65,699,472 | 1917 | 30,050,220 |
| 1908 | 63,479,862 | | |

The year 1903 was a record one for gold production, with a yield valued at \$79,192,164, from which time the production has been steadily declining until in 1917 it was less than 40% of the 1903 record. In 10 months of 1918 the production of the Commonwealth, exclusive of the Northern Territory, was only \$22,163,700. Increased cost of production, Government restriction, and the great number of skilled miners who were in the War have been given as the chief reasons for the decline in production. The director general of Geological Survey, Victoria, at a conference of gold producers in January, 1919, stated that he was quite certain that gold in Victoria was by no means exhausted. He stated that there was not a mine working in Ballarat East, but that though the mines in that field had been worked for 60 years they had not reached to a third of the depth of the Kalgoorlie mines. The conditions of mining have simply been against the industry. The president of the Tyronnell Gold Mining Co., Queensland, at the same conference stated that there was a great belt in Queensland still undeveloped, but that with existing high cost of production and restricted market for the product there was no hope of developing it. One speaker stated that unless the miners adopted a more sympathetic attitude toward the mining companies of North Queensland the mines would be forced to shut down.

A Metallurgical Journey to Shasta, California—IV

The Bully Hill Mines. Reverberatory Practice. Treatment of the Zinc in Copper Ores. The Bag-Houses at Mammoth. Sprague Process.

By HERBERT LANG

The district around Bully Hill bears a close likeness to that of the Afterthought, in the manner of ore occurrence and general geology. It is now about 60 years since the first discoveries were made in that camp, years during which all the ups and downs of mining life were experienced. Activity at first centred upon certain placers of limited extent, but rich enough to draw attention from outside. After this the silver ores about Copper City, the distributing point of the locality, were uncovered, and for a number of years, up to 1880, a considerable production of that metal was made. As at Afterthought, a silver mill was erected, and with the same results, namely, some measure of success while the richer surface ores were being worked, but an entire cessation of operations when, the mines having gone deeper, the underlying sulphides alone were left. The Bully Hill-Copper City mines, however, proved more productive than those of Afterthought, and work went on for a longer time, and with better financial results. No trustworthy information is to be had concerning the output, but it is loosely asserted that a million dollars was drawn from these mines before the year 1880, and this may well have been the case. The little stamp-mill through which the ore, or the greater part of it, passed still stands on its old site near Copper City, a relic of by-gone days. After that date a period of inactivity supervened until along in the 'nineties, when, owing to the success of the Mountain Copper Co., at Iron Mountain near-by, renewed interest began to be shown, and it was realized that the old camp possessed valuable reserves of ore not dissimilar from those being worked at Keswick. James Sallee was the pioneer in these operations, as he had been at Iron Mountain; for, having relieved himself from his entanglements there, and knowing something of the conditions at Bully Hill, he proceeded to develop certain claims, with excellent results. Mr. Sallee was chiefly a promoter, and in that capacity he endeavored to enlist Californian capital in his new undertaking, but without success. His theme was the copper ore which he had found in abundance in the old Bully Hill claim; but to this the wiseacres of San Francisco turned a deaf ear, as was their wont when the red metal was mentioned. They harked back to the days when men went broke in copper in the times succeeding the Civil War, and refused to invest a cent in California's copper mines. Three years of struggle and

Sallee sold his interest to Capt. J. R. De Lamar, a famous mine-operator, deceased in 1918. The consideration, practically in cash, was \$225,000, whereby Sallee realized a comfortable and well deserved fortune.

Under De Lamar's energetic direction the district entered upon an era of activity, the gross output running into the millions. After the opening of the Bully Hill mine, the erection of a smelting works followed and a steady stream of blister copper went forward to the refinery at Chrome, in New Jersey, during the five years of De Lamar's ownership. Smelting began on the enriched ores of the upper parts of the mine, the grade falling off as depth was gained and the unaltered sulphides came in. While the ore at first carried as much as 15% copper, with a more than proportionate amount of gold and silver, the average ore smelted during the De Lamar management could not have exceeded 5%, with four or five dollars in precious metals. The bullion might have contained \$100 in the precious metals, but probably somewhat less, although it was no doubt the richest smelted product ever sent from Shasta county.

In the course of time, while the ore was becoming poorer, another source of difficulty arose in the shape of the fume question, which has proved such a drawback to every smelter throughout the country. With wise foresight the Captain made haste to dispose of his property, selling it in 1905 to the General Electric Co., of New York, at a price understood to have been \$1,250,000. The smelting works then included a blast-furnace with a daily capacity of about 150 tons; a converter plant of corresponding magnitude; a battery of 60 roasting-stalls working through an imposing brick smokestack; 2 McDougall calciners of moderate size, together with such accessories as an electric crane and briquetting machinery—in short, a complete plant and the second in age and the fourth in size and cost among the five considerable plants erected in Shasta county. The plan was from the first to produce blister copper in bars for shipment, instead of, like the Mountain Copper Co., making matte only, to be converted into copper elsewhere.

For a time after the accession of the General Electric Co. the mines, the Rising Star in particular, was the scene of energetic development, after which the smelting works were enlarged and smelting resumed. The railway, styled the Sacramento Valley & Eastern, was completed from Pit, a station on the Southern Pacific, to Bully

Hill, a distance of 14 miles, at a cost of \$650,000. Certain additions to the smelter brought its daily duty up to 350 tons, but during the dozen years of the Electric company's ownership hardly 50,000 tons of ore was smelted. The total amount treated during both managements reached 417,671 tons, of which 220,946 tons was derived from the Bully Hill mine, 174,869 from the Rising Star, and 16,856 from the Copper City mine. The average extraction was: copper, 4.24%; gold, 0.085 oz.; and silver, 4.20 oz. per ton. The total metal product, shipped in the form of copper bullion, amounted to 34,413.596 lb. copper, reckoned at 13c. per pound, making \$4,473,767.48; 34,554 oz. gold at \$20, worth \$691,080; and 1,707,875 oz. silver worth, at 50c. per oz., \$853,937.50. The whole output reached the respectable sum of \$6,018,784.98.

The works closed on June 30, 1910, when 400 men were laid off, and the locality lapsed into quietude for some years.

The General Electric Co., although it had provided itself with an enlarged smelting works, adopted the plan of shipping the matte, instead of converting it, dispatching the greater part to the Mammoth works at Kennett after that establishment came into existence. Among the innovations introduced at Bully Hill was a reverberatory smelting furnace. It was of modest dimensions, measuring 35 ft. by 16 in the hearth, and is of some interest by reason of an exceptional feature: it was so arranged that the blast of the cupola near-by was heated by the chimney gases, which pass off, as all must know, at a high temperature. It is the prevailing custom nowadays to utilize these hot gases for heating steam-boilers, and many new plants in the United States are so designed. Previously it had been the custom to let the gases go to waste, thereby incurring great loss, since of the total heat generated in that kind of furnace quite one-half escapes through the flue. By introducing a boiler in the path of the gas, this heat, or a good part of it, is recovered in the form of steam, and the power thus saved is usually sufficient to run the whole works. But the Bully Hill plant, being driven by electricity generated by water-power, could not do this, so the heat was intercepted by means of a pipe-stove, which occupied the same position as the boilers spoken of, the air thus heated by passing through the pipes going to the blast-furnace and assisting combustion therein, with, no doubt, a considerable saving of fuel. This procedure is certainly feasible and not to be lightly condemned; yet it is open to the great objection that both furnaces, in order to obtain good results, had to work concurrently, which would be almost too much to expect. Surely one or the other must have halted or been out of step at times. The heating of the blast to copper furnaces, a practice now out of date, has often been accomplished by means of pipe-stoves like that of Bully Hill, but they were heated by an independent fire, which could be urged when the furnaces became torpid, or relaxed when it rose to uncomfortable activity.

This reverberatory, having a hearth area of about

400 sq. ft., smelted, we are told, only about 30 tons per day, or at the rate of 150 lb. per square foot, which is much less than the usual duty. Ordinarily, when cold ores alone are charged the duty varies from 200 to 250 lb., and if heated material, such as calcine, forms the whole or a considerable part, the duty rises to as much as 350 lb., or in exceptional cases to 400 lb. and upward. What the cause of the slow rate of fusion may have been one can only conjecture; but it may have been owing to an overplus of flue-dust, which is notoriously hard to smelt, or to too difficult a charge, by reason of too great a proportion of such an ingredient as alumina, barite, or silica. The smelting mixture indeed seems to have been difficult, not only for the reverberatory but for the blast-furnace as well. At times the silica reached 23%, the alumina 12%, the barite 27%, and the zinc 16%. But not simultaneously, else the furnaces could not have run. The average sulphur seems to have been about 23%, which points to the useful employment of the pyritic process; but the roasting-smelting method was selected instead. Now, the reverberatory process is strongly indicated for such material instead of the blast-furnace; but the reverberatory seems to have been set up for the subsidiary purpose of smelting flue-dust and 'fines'. The mixed plant, although having many modern features of excellence, does not appear to have advanced the art of smelting. The blast-furnace required fluxes to a considerable extent, the surface ores having been deficient in basic elements, and limestone was purchased from the quarries of Holt & Gregg, near Kennett. Iron ore, too, seems to have been added, from the Heroult deposits, some miles to the west. The construction of the Sacramento Valley & Eastern railroad connecting the smelter with the Southern Pacific rendered easy the importation of fuel and fluxing materials.

The average slag falling from these exceptional ores analyzed as follows:

| | % | | % |
|---------------------|----|--------------------|----|
| Silica | 36 | Barium oxide | 8 |
| Ferrous oxide | 21 | Alumina | 12 |
| Lime | 9 | Zinc | 8 |

Sulphur, magnetic oxide of iron, and minor ingredients are not stated. The matte contained 39% copper, and was sold to the Mammoth works. The converters then remained idle. The analyses do not indicate it, but it is more than likely, considering the character of the ores, that a considerable proportion of the barite went into both the slag and matte in the form of sulphide. Recent analyses usually show this result, and the conclusion that barite is merely fused in part without being converted into silicate is quite commonly held. The effect of barium sulphate on the smelting process is on the whole prejudicial, since it makes the slag heavier, while the portion going into the matte makes it lighter, thus lessening the difference between the specific gravities of the two, upon which their effective separation depends. Therefore we should expect to find a considerable loss of precious metals in the slag; and this is what is found in practice. From a chemical standpoint one would conjecture that the barite would be more thor-

oughly decomposed in the reverberatory than in the blast-furnace, since the familiar reaction between sulphates and sulphides would evidently take place more effectually there; but beliefs on this point rest more upon conjecture than upon direct evidence. Whether the pyritic furnace, run with a minimum of fuel, or with none at all, would produce as thorough a decomposition of the mineral, with the formation of barium silicate as the reverberatory with its customary neutral atmosphere, is a question yet to be settled. Either furnace is capable of fusing the barite as such and driving it into slag or matte, while the coke-burning cupola reduces it to the form of sulphide. An excess of fuel therefore acts disadvantageously, so that with ores of the composition of those of Bully Hill and Afterthought there is no question of the propriety of using either the pyritic or the reverberatory method, even when the question of cheapness had not arisen. This brings us to the consideration of what the Bully Hill ores really were and are.

The valuable metals are gold, silver, copper, and zinc, all combined with sulphur, forming especially blende, pyrite, and chalcopryite, with less quantities of galena, bornite, and chalcocite. These minerals constitute about one-half the weight of the ore now available, the proportion varying here and there. In some parts of the mines zinc-blende predominates, and there are areas in which it forms from one-half to three-fourths of the whole mass. In other portions pyrite predominates, and in at least one section of the Rising Star mine it forms almost the whole of the orebody. The copper is distributed unevenly throughout, being found in small quantities in all of the orebodies, and varying from 1 or 2% to 6% or more. By careful sorting the company was enabled to ship during 1918 over 25,000 tons of ore averaging 6%, to do which they were obliged to reject a much larger quantity, averaging perhaps 2%. Gold and silver likewise occur in all the ores, as will be seen on inspection of the accompanying assay-returns.

| |
|---|
| The ratio of zinc to copper in the Bully Hill mine is 2 : 1 ; |
| “ “ “ Rising Star “ 10 : 1 ; |
| “ “ “ Copper City “ 8 : 1. |

These properties, which began long ago as gold mines, were worked later as silver mines, then by Capt. De Lamar as copper mines, must now be regarded as zinc mines. There is no doubt, however, that copper, in some parts of the lodes, will continue to be important.

Although the zinc is increasing as depth is gained, such is the uneven distribution of the metals that a considerable variety of ores exists, ranging from nearly pure pyrite with but one or two percentages of copper and very little zinc, to heavy blende ores with 30 to 40% zinc and correspondingly little copper and iron. Undoubtedly the properties will be able to furnish considerable amounts of copper ore of a grade suitable for direct smelting, as work continues, but greater amounts of zinc ore that cannot be smelted without the preliminary removal of the zinc. The sulphur content, being

contingent upon the associated metals, is necessarily variable. With each unit of zinc there is combined one-half unit of sulphur; with each unit of copper nearly one of sulphur; with each unit of the iron in pyrite there is combined little more than one unit of sulphur. The bodies of purer pyrite must have, accordingly, nearly 50% of sulphur, which constitutes an excellent material for acid-making, and can be profitably sold as such, without regard to its small values in copper and the precious metals.

The stony part of the ore—the gangue—consists for the most part of silica, alumina, and barite. In the proportion in which they occur they form no serious obstacle in smelting, being rejected with sufficient ease. These gangue-minerals would be inert toward dilute acids were it desired to form salts of zinc and copper in the roasted ore; but small quantities of lime and magnesia, amounting to about 30%, might perhaps go into solution. On the whole, a chemical process whereby it were proposed to remove the zinc (and perhaps the copper also) by solution, preparatory to smelting the residues for their gold and silver, would seem applicable. I will revert to this topic, to show its bearing upon a general scheme of treatment of the complex sulphide ores. Anhydrite, the sulphate of lime, exists in these ores; if in considerable quantity, it might be looked upon as a useful flux for the smelter, in view of its favorable reaction upon sulphides in the reverberatory furnace.

The Bully Hill property, after having been in the possession of the General Electric Co. for 12 years, was sold in 1917, through the agency of C. L. Wilson, to an association of Californian financiers headed by Walter Arnstein, for the reported sum of \$750,000. The railway and all other improvements were included. The sum seems small for a property of such magnitude, and indeed scarcely covers the cost of the railway. The purchasers have expended money freely in the development of the mines, the Rising Star in particular, and have introduced the flotation process for the concentration of the ores.

The Arnstein association, known now as the Bully Hill Mining Co., extracted in 1918 over 27,000 tons of selected ore, averaging a little over 6% copper, with a dollar or so in precious metals, 5.4% zinc, and 30% iron, making a desirable smelting material. This was in addition to about 2000 tons of somewhat lower-grade material.

Later advices from the mine indicate that the exploration work is proving very successful. Roger L. Beals, general manager, writes, under date of May 22: “We are only doing straight development work here now. We have opened new ground in the Rising Star that has higher grade zinc ore than any shown in the mine at the time of your visit, and with greater width, averaging 25 ft. wide, and assaying over the full width 30% zinc. A good shoot of silver ore has also been opened above the main tunnel level of the Star. The result is to greatly increase the known ore-bearing area. . . . It is probable that we shall put in a good-sized electrolytic zinc plant this fall. . . .”

Mr. Beal's estimates of the ore exposed previously to these new discoveries, show as follows:

In the Bully Hill mine, 50,000 tons of probable ore; Rising Star, just west of the Bully Hill, 147,600 tons delimited ore and 44,000 tons of probable ore; in the Copper City mine, 4000 ft. south-west of the latter, 25,000 tons of probable ore. The average assays are as follows:

| | Gold, oz. | Silver, oz. | Copper, % | Zinc, % |
|-------------------|-----------|-------------|-----------|---------|
| Bully Hill | 0.12 | 6.46 | 2.33 | 7.83 |
| Rising Star | 0.03 | 4.00 | 2.30 | 23.00 |
| Copper City | 0.04 | 6.085 | 2.08 | 17.50 |

An analysis of a certain portion of the Bully Hill mine product will shed light upon its metallurgical character; it follows:

| | % | Insoluble: | % |
|--|-------|--------------------------------------|-------------|
| Cu | 3.33 | SiO ₂ | 23.54 |
| Zn | 7.82 | Al ₂ O ₃ | 6.40 |
| Fe | 12.68 | BaSO ₄ | 17.55 |
| Al ₂ O ₃ (soluble) | 4.95 | | Oz. per ton |
| S | 17.15 | Au | 0.12 |
| MgO | 1.47 | Ag | 6.46 |
| CaO | 1.45 | | |

While the Bully Hill mines constitute the most important part of the mining district, there are other claims of great promise, notably the Arps group at Copper City. This group, which includes 14 or 15 locations, was sold lately by the owners, Messrs. Saeltzer, Arps, and associates, to F. B. Hink, who is now engaged in development work. Considerable amounts of heavy sulphide ore, said to carry 5% of copper with 5 to 20% zinc, and about \$5 in gold and silver, are exposed, while a large tonnage suitable for concentration is being explored. The ore is said to occur in widths of 100 ft. or more. Some shipments of ore of the better quality have been made to the smelters and more is to follow.

It is a matter of congratulation among the mining operators west of the Sacramento that they have not so much zinc to contend with as their friends east of the river. They do not claim to have none at all, but merely that it is not so abundant as to render smelting impracticable. They acknowledge that in some of their mines the zinc runs too high to admit of smelting, but they look forward to shipping or otherwise disposing of this when the good time of high prices comes again. Meanwhile a good deal of zinc finds its way even into the Mammoth furnaces, the charge of which carries some 4%, whence we compute that some 40 tons or more of zinc finds its final resting-place in the vast slag-dump every day. The market-value of this quantity is hardly more than \$4000 now, and therefore it is not worth bothering about. The behavior and destiny of this metal form one of the most interesting of the many interesting topics connected with this plant. The blast-furnaces here, while of quite moderate size, namely, 50 by 180 inches at the tuyeres, are driven rapidly with a blast of 30 ounces, with a shallow charge and fairly hot tops, which conditions would seem to favor the expulsion not only of zinc, but of every other volatile substance. The daily duty is 6.4 tons of charge per square foot of hearth-area, which infers great interior activity. But it appears that zinc is not volatilized largely, as might be expected; on the contrary, it enters the slag and stays with it,

except the small proportion caught in the bag-house. The material here caught contains:

| | % |
|---------------|------------------|
| Zinc | 25 |
| Lead | 6 |
| Arsenic | 8 |
| Copper | 1 |
| Gold | 0.03 oz. per ton |
| Silver | 0.5 " " " |

Of the zinc, 14% exists as uncombined oxide, and 11% as the sulphate. And here lies an interesting problem. Free sulphur tri-oxide is found in the smoke, and is neutralized with caustic lime before entering the bags, to prevent their corrosion. Why does not the tri-oxide combine with the free zinc oxide while on the way through the long iron cooling system? Some of it does, but why not all? Since 15 tons of fume is collected in the bags each day, three furnaces running, and smelting, roughly, 1200 tons of charge containing, roughly, 40 tons of zinc. The fume contains 25% zinc; therefore only 3.75 tons of zinc escape slagging, which is hardly one-tenth of the whole quantity. Some zinc, in one form or another, may lodge in the dust-chambers, through which the smoke passes on its way to the bags, but as the dust is put through again, it cannot escape that way. It is not a little curious that the pyritic process, which eliminates all other volatile matters so completely, should expel so little zinc. Of course, it may be said that a portion goes into the matte, which is doubtless true; but from the matte it must go either into the converter slag, or into the gases, which go to the bag-house along with the furnace smoke, or else it must go through the slag back into the furnace smoke, which is the destination of all converter slags.

A bag-house is a wonderful contrivance, but as a money-making institution it is not pre-eminent. It sifts out the solid, the coloring matter, unerringly from a hundred thousand cubic feet of smoke every minute and lets the gases go away all but invisible, and everybody speaks well of it. But the fume it collects nobody praises and nobody wants. To re-smelt it would be to return the lead and the arsenic and perhaps other objectionable matters to the smelting system, and thereby increase the collections to an unmanageable extent. The lead, it is discovered, has a tendency to deposit itself in the long steel pipes which form so imposing a part of the plant, and which being comparatively inaccessible for cleaning, produce an obstruction that would be serious. Nor can the collections be economically smelted separately; for the zinc content forbids it. They might, of course, be diluted with non-zinky ore and then passed through a stack, either with or without the bag-house connection, but attention has mainly been given to chemical and electrical methods for their treatment. Many inventors, inspired with such ideas, and assuming that they could furnish a cheap and therefore suitable material for zinc extraction, have put forward proposals that, although never carried out, still gave occasion for the loss of much time and in one or two instances some money. The recovery of zinc by chemical means depends too much upon the

purity of the solutions used to admit of the presence of large quantities of arsenic above all.

The cooling system has been mentioned. This is extensive, consisting mainly of metal pipes through which the smoke passes and in which it is cooled to the temperature—about the boiling-point of water—at which the woolen bags are not attacked by the sulphur gases. These gases are two, the tri-oxide and the di-oxide, the latter existing in by far the larger proportion. The tri-oxide is peculiarly virulent, and has a decided effect upon organic matter, especially in the presence of moisture. The bags are defended by withdrawing the tri-oxide from the fume, just before its entrance, by means of caustic lime, which is fed into the stream of smoke. The sulphate of lime is formed, and the smoke, now freed from its more corrosive concomitant, filters through the fabric, separating the solid matter, the character of which has been discussed.

Far from desiring to criticize, but seeking information, I would ask, why are hot gases allowed to reach the cooling system? There are expedients by which this may be prevented without having to employ such an array of costly and cumbersome piping to reduce the temperature. The first and most obvious means would be to feed the furnace deeper and prevent fire-tops, when the smoke would go off at a much lower temperature. This practice should, likewise, lessen the fuel requirements of the furnace. Another expedient presents itself. In the early days of pyritic smelting a number of inventions were put forth essaying to heat the blast by means of the waste heat of the exit gases—the smoke. None of these inventions was particularly successful, because the temperature of the smoke is neither very exalted nor very regular. It may rise at times to 600° or 700°, when the top flames, but is hardly more than 300° or so when the furnace is run, as is done commonly, with what is called the cold top, meaning the condition when fire cannot be seen on the surface of the charge. When the top is hottest and the gases are at such a heat as to make the contrivance effective the feeding of the next charge reduces the temperature and diminishes the efficiency of the apparatus. It follows, then, that as a hot-blast stove the apparatus introduced to heat the blast by introducing coils of iron pipe in the stream of gases was of little use; but if it were desirable, as at the Mammoth plant, to cool the outgoing smoke to a degree that would obviate the necessity of employing outside air to do the work, then the despised hot-blast apparatus might be worth while. A small increment of heat admitting of the reduction of the charge of fuel below 8% of poor coke, and the increased effectiveness of dust-chamber systems, by being compelled to handle a volume of gas much diminished by diminishing temperature, and lessened probability of damage to bags, might, it is diffidently urged, compensate for the trouble of making a change in practice; or, rather, in the construction of future works.

The Sprague process, as the combined neutralization-filtration method is called, was not installed at the Mammoth works without the most careful deliberation; and

it is not likely that any considerations of so obvious a nature were overlooked. The skill and care devoted to the conduct of the plant, and indeed of the whole works, are exemplary. It would be difficult to point to a reduction plant in any part of the country which is handled with more address and competence. The air of professional expertness evinced by the officials in charge is truly admirable, and is doubtless due to Mr. Metcalf's life-long experience and Mr. Kervin's 14 years incumbency at this one plant. If anything were needed to prove their efficiency it would suffice to point to the fact that the great establishment has succeeded financially while smelting a mixture that year in and year out contains only 2½% copper, with hardly more than two dollars per ton in gold and silver, and pays a profit. The uninitiated should learn that all this material, amounting to 1000 tons per day, has to be sampled, assayed, weighed, placed in bins, drawn out and trammed to the furnaces, melted with suitable fluxes, the slag is drawn half a mile to the dump and discarded, the matte is bessemerized in acid-lined converters, the copper bars are shipped to New Jersey and refined, the gold and silver are separated, and the products sold; to cap the climax, the fume has to be collected in the bags and disposed of, and then the smoke, deprived of its solid components, has to be discharged into the atmosphere in a manner to suit the tastes and desires of neighbors. How all this can be done with ore of this description passes understanding. The ore treated is not derived wholly from the company's mines, though these are large and highly productive. A great deal is purchased from mines in distant regions, and well paid for. Not only does the Mammoth concern pay its own profits, but it enables several others to make money. Thus, the Balaklala, which contributed nearly 80,000 tons of sulphides to the Mammoth plant last year, was able to pay to its stockholders a dividend of \$175,000, although its ore contained a little more than 3% copper, with 1½ oz. silver and 75c. in gold. This ore had to be mined, transported by aerial tram to the railway, and freighted to Kennett, a rail haul of five miles. That a dividend was paid out of such ore is due in part to the war price of metals, but largely to excellent management of the Balaklala company.

It is desirable to bear in mind the gradual impoverishment of the Shasta ores, during the 20-odd years of smelting activity; how, beginning with an average of 7% and even higher, at Iron Mountain, and nearly the same at Bully Hill and Afterthought, the tenor has now fallen to 2 or 3% in run-of-mine, and with little prospect of finding extensive orebodies of much better class.

Returning to the matter of bag-house sublimates—it would appear from the experience at Mammoth that the current notions as to the volatility of the metals are fairly borne out, excepting as to the zinc. Under circumstances analogous to those at plants where the expulsion of the whole or at least the greater part of that metal is achieved, the ratio of the expelled zinc to that portion retained by the slag is, as we have seen, but 1:10 or thereabout. In regular practice at Canyon City, Colo-

rado, and similarly elsewhere, zinc ores were subjected to a blast comparable in intensity to that employed at Kennett, and using a much greater proportion of carbonaceous fuel, and the result was to expel by far the greater portion of the zinc, the process being the Bartlett method, which would seem to differ in no essential from that employed at Kennett, with the exception that the depth of charge was much less. The disparity of results is certainly inexplicable.

In other respects the sublimate appears to accord with ordinary experience. The silver, which under these circumstances is noticeably volatile, is concentrated in the bag-house fume to a considerable extent, the assays showing an enrichment of about three times the content of the ore; so that by comparing roughly the collections with the amount in the charge it is found that about 5% is volatilized; or more accurately stated, about 5% of the total silver is retained by the bags. It is apparent that this must have been in the gaseous form when it left the furnace, and in the solid form when stopped by the bags. It is possible that a further quantity may have escaped condensation and have passed through the interstices of the fabric. This, indeed, is probable; for it is hardly to be imagined that the act of condensation to the solid form took place in consequence of contact with the bags themselves, but rather was brought about by the cooling. Of one thing we are assured: the 75 oz. of silver caught daily in these bags would infallibly have been lost into the air without them, nor would the loss have attracted notice. It is therefore pertinent to inquire if the same or a greater loss is not incurred at every matting or lead-smelting works from true volatilization, unchecked by condensing apparatus. The matter appears to resolve itself largely into the question of dust-chamber effectiveness, in which the cooling effect of extended surfaces is interwoven.

The comparative volatility of gold has been mentioned in connection with the subject of chlorination. Under the assumption made as to the amount of precious metals contained in the smelting charge at Mammoth, taken in connection with the quoted assay of the bag-house fume, it is seen that 1.5% of the gold is caught in the bags, which is about one-third as much as in the case of silver. This corresponds well with what is known of the relative volatility of the two metals, but, as in the case of silver, it does not afford quantitative evidence of the actual volatility. The query persists as to the amount that may possibly escape through the meshes. It is evident that an important field of experiment and conjecture remains open in this respect. The quantity of metallic vapor still remaining in the fume after cooling to the boiling-point of water or lower is doubtless very small; it may be that none at all remains; but it is probable that actual investigation of this difficult matter has not yet been made.

IN ECUADOR the production of gold bullion in May was 239.8 troy lb., cyanide precipitates, 1710 lb., and cyanide metallic precipitates, 900 lb., all of which was exported,

as is the case each month. Considerable quantities of gold are produced by hand methods in various parts of the country, the exact amount not being known. About 3500 bbl. of crude petroleum was produced during the month, all of which was consumed at Guayaquil. A British house has purchased a large tract of oil-bearing land near Santa Elena, and has received equipment from the United States. It is intended to drill for a number of wells. The manganese mine north of Quito is not operated now, as no market could be found for the product.

Australian Brown Coal

A threatened but averted strike of the coal miners of New South Wales and an actual coastal shipping and wharf labor strike, which has caused a shortage of coal in several States, particularly Victoria, has revived interest in the remarkable deposits of so-called 'brown coal' in the Gippsland district, Victoria. This seems to be coal in the process of formation, not completely carbonized, but enough to make it a good fuel for many purposes, though not for the manufacture of coke. If mixed with wood or black coal it can be used for domestic purposes. It looks like something between wood and coal. Chunks of wood have actually been found imbedded in the brown coal, and lumps of the coal itself frequently exhibit the grain of wood. The deposits are supposed to be the residuum of vast pine forests which covered part of the State of Victoria in prehistoric times. The coal in its present form is softer than bituminous, and is dull black or snuff brown in color. These brown coal beds are said to be the thickest in the world. At Morwell 780 ft. of coal has been passed through in a bore of 1010 ft. The four principal areas of occurrence cover approximately 1200 square miles of an average thickness of 50 ft. The depth of the coal seams below the surface varies from 60 to 500 ft., the average being nearer the first figure. The total amount of brown coal in the four distinct large areas and numerous small and widely divided deposits is estimated at 30,000,000 tons. No extensive mining operations in these areas, which are controlled by the State of Victoria, have yet been carried on. Up to 1916, the last year for which official figures are available, the total amount mined was but 84,663 tons, and the 1916 production was only 2915 tons. But plans are now being made for a more rapid development, which will doubtless be accelerated by the present abnormal demand created by the strike situation. Before the War a private syndicate, said to have a backing of \$100,000,000, was negotiating for one of the larger deposits, but the State did not think it proper to permit a private company to acquire so valuable a natural asset. A typical analysis of the brown coal at Morwell, the centre of the largest area, showed the following composition (in percentages): Water, 53; volatile matter, 24.50; fixed carbon, 21.50; ash, 1. Further tests showed sulphur, 0.7%; nitrogen, 0.3%; calorific value, 5500 to 6000 B.t.u.; evaporation value, 4 lb. of water; gas per ton, 6500 cu. ft.; ammonium sulphate, 32 lb. per ton.

Mine Sampling

By LEON FEUCHERE

*In the mining of copper ore in the Warren district, where orebodies are small and irregular, and where the grade of the ore throughout an orebody is also liable to be irregular, there are two more or less antagonistic factors to be considered. The first is the cost of mining, and the second is the grade of ore mined. In order to get a low cost, it is always a temptation to mine as big an area as possible all together, thus getting a larger tonnage per man-shift. In doing this, however, the grade of the ore is liable to suffer. There is a happy medium between the high cost required to obtain absolutely clean ore and the cheap cost to obtain a poorer grade of ore. It is this happy medium for which one should strive.

The final result, that is, the cost per pound of copper, is the one to be considered. For example, if in any stope it costs \$1.60 per ton to land absolutely clean ore in the stope-chutes and if the ore runs 8% copper or 160 lb. per ton, the cost per pound will be $1.60 \div 160$ or 1c. per pound. If, on the other hand, by no sorting the cost can be reduced to \$1 per ton, the grade being reduced to 4% or 80 lb. per ton, the cost per pound will be $1.00 \div 80$ or $1\frac{1}{4}$ c. per pound. Again, if the grade can be increased to 7% or 140 lb. per ton by judicious sorting, thereby increasing the mining cost to \$1.30 per ton, the cost per pound will be $1.30 \div 140$ or 0.9c. per pound, which will be the best thing to be done. This, however, brings in another factor. If the waste in the stope runs just below the minimum, and, therefore, will produce some copper, the above method of figuring will be correct. If, however, as in a good many of our oxidized orebodies, the waste consists of absolutely barren limestone, it will always pay to spend enough money to sort it out or an amount equivalent to what it would cost to handle the waste from the stope to the smelter. Re-figuring our example again, for absolutely clean sorting, the cost is \$1.60 per ton, for 8% or 160-lb. ore, and the cost per pound is 1c. per pound of copper. If by fair sorting the grade is reduced to 7% or 140 lb. per ton, at a cost of \$1.30, the apparent cost is as before, $1.30 \div 140$ or 0.9c. per pound. But for every ton of 7% ore, one-eighth of a ton of absolute waste is being mined. To get a ton of material from the stope to the smelter it costs about \$1.55, figuring tramming, hoisting, and freight. This does not include the charges of development, dead work, drainage, sanitation, accidents, taxes, assaying, sampling, and miscellaneous expenses. In addition to this, the smelting charge is approximately \$3. The total charge against this eighth of a ton of waste will, therefore, be $4.55 \div 8$ or 57c., which must be added to the stope cost. Therefore, for

fair sorting the total cost per pound will be \$1.30 plus 57c. divided by 140, or 1.3c. per pound. For still poorer sorting, the cost will be higher yet, as can be readily seen.

The Copper Queen figures out each month a grade of ore for each stope, which will just pay expenses. This grade is called the 'minimum' for the stope. It depends upon and is figured out from three factors, the market price of copper, the stope cost, and the smelter cost, which depends on the kind and amount of impurity in the ore, that is, the amount of fluxing material, such as iron, sulphur, and lime, and the amount of material requiring fluxing, such as silica and alumina.

Correct sampling is one of the most difficult operations connected with mining, as a small sample is supposed to represent the grade of a relatively large amount, and any error in the sample makes an enormous error on the whole. To bring this point out, the samples sent to the assay-office are crushed up and only a very small weight is used for the actual assay, the rest, called the 'reject', being sent back to the ore-chutes. For the last six months of 1918 there was mined a total of 337,673 tons of ore. The assay-office rejects in this period amounted to 901 tons, or only 0.27 of 1%. For this reason it is necessary to check the samples several times in order to get as reliable results as possible.

The route of the ore and where it is sampled are as follows: First it is sampled before breaking in the stopes. This is done by the shift-boss. It is sampled by the trammers as they draw the chutes, each car being sampled by means of a sample shovel, and the sample is put in powder-boxes or special sample-bins. It is again sampled at the bottom of each haulage-chute by the motor crew. No further sampling is done underground. The final Bisbee sample is that taken at the belts at the Sacramento shaft. This is done by a special sample crew, a shovelful being taken for every 12 ft. of belt, a bell ringing to indicate where to sample. Twelve feet of belt represents approximately one ton of ore. This belt sample gives the most accurate results of all, and checks the smelter almost exactly. It gives the sample for each haulage-level and can be checked against the chute samples. It is found to be nearly always about 0.4% lower than the chute samples.

The reasons for the chute samples being high are, first, the tendency of the trammer to pick out the easiest part of the car, that is, fine material; and second, it is human nature to want to get a good grade of sample from the place in which you are working. In order to take a reliable sample, it is necessary to shut your eyes and stick your shovel into the car, taking out whatever comes on the shovel. As a matter of fact, this cannot be done in

*One of the bulletins of the Practical Mining Course established by the Phelps Dodge Corporation at Bisbee.

practice, so that more fine is taken than represents the average content of the car, and to make the sample look reasonable a boulder or two is added, which is usually of a better grade than the average. The reliability of the chute samples depends on the interest taken by the shift-boss in giving the trummer proper instructions and impressing on him the importance of this phase of his work.

In taking samples in the stope, the method depends on the kind of ore mined. If the ore is uniform and no sorting is possible, the whole face should be sampled by taking a groove from side to side or from top to bottom, depending on the way the ore lies. In this kind of ore, when the face is being drilled, the drillings from all the holes yield the most reliable sample. In taking a pile sample, pieces should be taken from all through the pile, taking a pick and getting some from the bottom and inside of the pile as well as from the top.

If the ore is one that requires sorting, there are no fixed rules. The sample from the face will depend on the judgment of the shift-boss as to what can be and what will probably be sent down the chute. In this case it is always better to take a too low than a too high sample. Drillings are apt to be unreliable in this kind of ore. Pile samples are probably the most reliable of all, as after the ore is broken it is easier to see what can be sorted out.

The relation of the sampling department to the mine department is analogous to the relation of an auditor to a book-keeper. The sampling department checks the samples where errors appear to have been made, throughout, from the stope to the belts. They have more time for this work than the shift-boss, and their samples are more liable to be correct. Being outsiders (like the auditor) they are more liable to detect errors than the man on the job, and like the auditor, they have the whole process before them, and not just one phase of the work.

In addition to the regular mine work, special sampling is done in some cases, such as in the development of new country. This is done when an accurate estimate of the grade is necessary, as in country where the ore will have to be concentrated, or where it is to be treated separately. In this case, the drifts and raises are sampled by grooving. A large piece of canvas is spread over the drift-bottom and a groove is cut about six inches wide and half an inch deep, using a moil and a single-jack. All chips are caught on the canvas, and represent accurately the value for each distance of drift grooved. Usually they are taken five feet long and are cut horizontally. If the ore lies in horizontal layers, the grooves are made vertical, from top to bottom every five feet along the drift. All raises are sampled in the same way. This work takes time and is done by specially trained samplers.

The general route of the samples is as follows: They are first taken by the bosses and trammers to the cage and thence to the surface. From here they are taken to certain convenient points and are gathered up about 9 a.m. and 1 p.m. by a special truck from the machine-

shop and taken to the assay-office. Those gathered at 9 o'clock are then taken out in the bucking-room. Here they are dumped out into iron pans, one for each sample, and the tags put into the pans. They are then put into the drying-ovens. After drying, they are crushed in a small crusher and cut down into two parts, one being the reject and the other used for the actual sample. The sample is then bucked on a bucking-table and thoroughly mixed. A small part of this is then weighed out for the actual assay. They are kept throughout in absolute order, and are then assayed by wet methods for copper, and the results posted in ledgers under the heading of the original tag. They are then transferred to the report sheets, which are ready at 11 o'clock. At 11:30 they are gathered up by the messenger and taken to the shafts, arriving there shortly before 12 o'clock. The results of the 1 o'clock samples are sent out the next day together with the morning samples. Every step is thoroughly systematized at the assay-office, so that the chance for mixing samples is slight.

In conclusion, the object of all sampling is to get a representative portion of the ore. The more uniform the ore is, the more reliable a small part of it, represented by the sample, will be. When an ore is spotty, and requires sorting, and in general for any sample, the larger the better, the best of course being the smelter returns on the whole ore. In stope sampling, the larger the samples the better. In chute samples, the human element should be eliminated just as far as possible. The object of what is being done should always be borne in mind and a sampler should always be on guard to keep from fooling himself.

ACCORDING TO FIGURES recently compiled, the production of Chilean nitrate during May, 1919, amounted to 3,039,390 Spanish quintals (1 Spanish quintal is equivalent to 101.44 pounds). This was a decrease of 2,256,839 quintals compared with the same period in 1918. From July 1, 1918, to May 31, 1919, production totaled only 47,821,761 quintals, whereas for the same period in 1917 and 1918 it rose to 59,511,277 quintals. Normally, however, production and demand centre around 40,000,000 quintals yearly. At present the amount exported is negligible, and it is estimated that if the present rate of production is maintained and there is not a corresponding demand established before the end of the year, there will be a sufficient quantity of nitrate on hand to take care of all normal demands for one year from January 1, 1920.

SINCE EGYPT is totally destitute of fuel except that furnished by the scanty trees which grow along the cliffs bordering the Nile, all of the fuel used must be imported. In 1916 over \$25,000,000 worth of coal was imported, much of this being needed for the cotton and sugar plantations and other industries. Under present conditions it seems probable that American coal could be delivered in Alexandria as cheaply as that from England, but this is a matter which could only be decided in actual practice.

REVIEW OF MINING

ARIZONA

DOUGLAS, JEROME, HUMBOLDT, DUQUESNE, COURTLAND,
SILVER BELL, BENSON

DOUGLAS.—More than 13,000,000 lb. of copper was made at the Calumet & Arizona and Copper Queen smelters during July, and both smelters are expected to show a considerable increase for August. The Copper Queen production for July was 8,400,000 lb., an increase of 1,200,000 lb. over June. It is expected that the August production will be about 9,000,000 lb., or a little more than half the war time capacity of the plant. Four blast-furnaces and one reverberatory were in use in July. The C. & A. made 4,854,040 lb. of copper. Three reverberatory furnaces were in use during the month, but both blast-furnaces of the plant remained cold. The production of sulphuric acid at the smelter reached normal before the end of July and continues to be made at the rate of 200 tons per day. The output of both smelters includes both company and customs ores.

JEROME.—United Verde Extension plans to hold to a production of 3,500,000 lb. per month for the present, according to an announcement made at the offices of J. S. Douglas. The approaching completion of the ore-haulage tunnel from the main shaft has released a number of men who have been engaged upon this work and they are being placed underground as rapidly as possible.

HUMBOLDT.—The Consolidated Arizona Smelting Co. produced during July 650,000 lb. of fine copper in bullion, it has been reported. The ore treated came from the Blue Bell and De Soto mines of the company, 11,400 tons being shipped to the smelter. The company's production now stands at about half that of last November.

DUQUESNE.—Engineers in the employ of the Phelps Dodge Corporation were reported recently to be examining the properties of the Duquesne Mining & Reduction Co. at Duquesne and Washington camp. This has given rise to a rumor that a deal is pending. Some years ago the Phelps Dodge interests endeavored to buy the Duquesne mines and offered a substantial price for them, which was refused. Following the death of Mr. Westinghouse, however, his heirs decided to give up mining and are understood to have offered the property for sale at \$150,000. The equipment alone is said to be worth this amount. At the present time Curry and Pannick have a temporary lease on the Duquesne mines and are shipping about 400 tons of ore per month to Douglas for smelting. Should the Phelps Dodge interests take over

the Duquesne property it is considered likely that the El Paso & Southwestern railroad would extend its branch line from Fort Huachuca, thus giving a direct haul from the property to the smelter at Douglas and obviating the handling of any part of the haul by teaming, the method now employed. The right-of-way is said to have been surveyed several years ago, passing through the Cannille mountains and San Rafael valley.

COURTLAND.—The Great Western Copper Co. has received and installed considerable machinery recently with the intention of further developing the property, according to R. M. Kinney, who was a recent visitor. One improvement planned is the enlargement of the working shaft. Several lessees are working on the property of the Great Western and the Leadville and are making frequent shipments of ore to Douglas.

SILVER BELL.—Edward Massey, Deputy State Mine Inspector, who returned recently from a visit to Tucson and the Silver Bell district, reports gratifying resumption of development work and mining in both districts. Silver Bell has reopened after having been closed since shortly after the signing of the Armistice. Its war-time production was quite profitable. Of the properties there, Mr. Massey reports that El Tiro, which is being worked by Percy Williams, is employing a force of 35 men and shipping 450 tons of ore per month. The North Star mine in the Twin Buttes district, belonging to the Midland Copper Co., has struck a 4½-ft. vein of ore in the main drift on the 250-ft. level, carrying 5% copper. The Queen, also owned by the Midland company, has shipped 200 tons of 15% ore since being reopened. At Mineral Hill, the Consolidated Copper Co. is doing development work and has opened a large body of ore on the 700-ft. level, which is being shipped to Tucson. The company plans to construct its own mill within a year.

BENSON.—Work on the plant of the Arizona Smelting & Power Co. is progressing so rapidly that it is now expected that the smelter will be ready to be blown-in about September 1. Grading for the installation of a new spur track from the main line of the Southern Pacific railroad is about finished. The concreting of the fume stack and dust chamber also has been finished. A compressor has been installed and is ready to start, and the boilers are ready for the lighting of the fires. The large fuel-oil tank for the plant has been completed, but it is necessary to extend the spur track which will serve it. A large cement cooling-tank for water has been completed and filled. The offices have been completed and now are being painted. The present furnace

capacity of the plant is 200 tons per day, but it has been built with the idea of probable expansion later. Ore already has begun to arrive and is being stacked ready for treatment when the plant is blown-in. Much ore has been contracted for with the idea of building up a considerable reserve. The generators for the power-plant have been shipped from Denver and are expected to reach Benson in a few days. The company has contracted to furnish light and power to the town. R. L. Lee, who has had charge of construction at the smelter, will be its superintendent in operation. Martin Fishback is general manager. Mr. Goetz, secretary and treasurer, believes that after a few months of operation it will be found necessary to increase the size of the smelter, and states that plans have been made for such increase up to 1000 tons per day capacity. The smelter will afford a market for the ores of the Johnson district and numerous small mines on the San Pedro river, below Benson.

The return of confidence in the copper situation has been indicated recently throughout the smaller properties of southern Arizona by reports of junk dealers in Tucson and Douglas. About two months ago when copper hit the zero point, the owners of a number of prosperous little properties dismantled their plants of machinery and sold it to junk dealers. Within the last two weeks these same miners have been hunting up their machinery at the junk shops and securing its return by paying the junkmen a handsome advance over the selling price of sixty days ago.

SUPERIOR.—It is estimated that the tunnel leading from the surface plant to the 500-ft. level of the three working shafts at the Magma mine will be completed and ready for use about next January.

CALIFORNIA

NEVADA, PLACER, AND SIERRA COUNTIES.

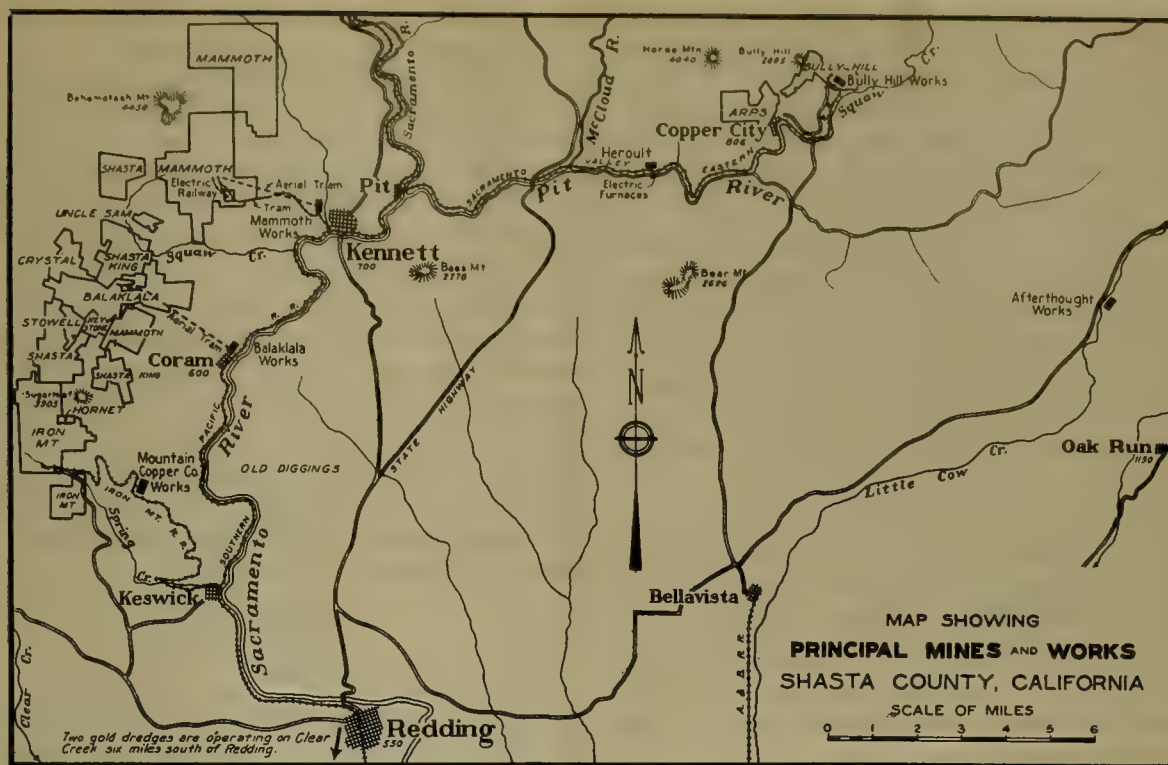

NEVADA COUNTY.—A special meeting of the Mine Workers Protective League of Grass Valley was called for the 16th instant "to decide what action shall be taken regarding non-union mine-workers of this district"; also to propose amendments to the constitution. There are over 750 registered members of the League and it would appear that it does not intend that non-members shall be allowed to work in any mine the superintendents of which were not a party to the amended agreement adopted in July and under which the men returned to work. The store feature part of that agreement which was brought about by the charge of unusual high prices prevailing in Grass Valley and was one of the principal causes which led to the strike, is still in abeyance; no move has yet been made by the companies to furnish ordinary living foods and supplies at cost. One large firm in town is operating on a two-price system—'cash' and 'carry'—but is in no way connected with the mines.

Peter Bender, of San Jose, on August 12 bid in the Mountaineer Mines Consolidated for the sum of \$151,474.65 on a judgment and accruing costs. The plaintiff

loaned large sums to the company, taking its note secured by a mortgage. The mines are close to Nevada City and cover a large acreage. The Golden Center Mining Co. recently cut a 2-ft. vein of high-grade ore in the west drift on the 500-ft. level. The find is encouraging and active development will commence at once. At a meeting of the directors in Sacramento Rodney McCormack was elected president; J. W. Howard secretary; Albert Bellania, director; and George H. Alltucker, a director to succeed C. A. Brockington, who resigned as such, but retains his position as superintendent. Preparations are being made to reopen the old Kenosha quartz mine in the Rough and Ready district and work will soon commence. The Kenosha company has been transferred to the Alcalde Gold Mines Co. George W. Root and Eastern associates took over the property. The first work will be to pump out the shaft, about 400 ft. deep, and for that purpose one of the Brunswick pumps will be used. The Kenosha has produced considerable jewelry store ore, although worked in a haphazard manner. At the same time there has been a heavy production of milling ore. The new operations will be in charge of Lloyd Root, son of the promoter.

The Sierra Asbestos Co., operating near Washington, has commenced for the season with a small crew. A suit involving title to the ground was tried in the Superior Court last June and the judge has not yet handed down his decision.

The proposed dam near Bullard's Bar, 20 miles west of Grass Valley, the first unit of which is now under construction, has started the Anti-Debris Commission into active opposition. The dam is for the purpose of creating a vast settling basin for hydraulic tailings and also for a reservoir to be drawn upon for the generation of electric power. The tailings would come from a renewal of hydraulic mining in a number of the old camps in Sierra and Nevada counties, the dam to ultimately hold ten million cubic yards. The fact that the dam is well in the foothills and to be of massive concrete construction avails nothing. District Attorney Coats of Sutter county has made a report to the supervisors of that county concerning the work done by the Commission the past year in holding hydraulic mining in check. In this report Coats admits that a dam for this purpose should be of the most substantial character, but at the same time stated that Sutter county should oppose its construction if at any time it appeared that the body of tailing was likely to find its way into the lower water courses. He based his statement upon a dam now being built at Liberty Hill in Nevada county and entirely unsuited to the demands which will be made upon it. He also advised the Commission to close down all mines operating behind dams of flimsy construction and cited the Omega dam, which broke down last winter under the pressure of heavy storms. Coats also reported that hydraulic mining was being done on streams that were tributary to the American and upper Sacramento rivers and cited one instance where a party operated over a month

without a permit. At this writing no legal proceedings have been commenced against the Marysville-Nevada Water & Power Co. to compel it to cease operations on its dam at Bullard's Bar; nor is it at all likely that such will be done until the first unit is finished and ready for the test. The Anti-Debris Commission may then fight the case.

PLACER COUNTY.—James Garvin has sold a 40-acre gravel tract near the Mayflower mine at Forest Hill to Elwood Dorman of San Francisco, H. L. McCullough of Denver and others. Machinery and supplies are already on the ground.

SIERRA COUNTY.—E. M. Doak, of San Francisco, recently paid a visit to the Young America mine, a producer of many years ago. A rumor is current that a small force will be put to work next month. John Mansfield is negotiating with Los Angeles men for a bond on the Shamrock quartz claims. The management of the Kate Hardy quartz mine near Forest City is making headway in every direction so that operations may continue during the coming winter. W. M. Cooper of San Jose is president of the new company, but the East is furnishing the money. The annual meeting of the Gibraltar Consolidated Gold Mining Co. was held in Downieville on the 4th instant, at which time Jacob Kieffer, Adam Kieffer, Peter Kieffer, W. I. Redding, and H. S. Tibbey were elected directors for the coming year at the mine. A raise is being cut for air and the tunnel is being driven ahead. R. G. Gillespie, of Pittsburgh, is looking after his interests in the Monarch and Cleveland quartz claims near Sierra City.

NEVADA

GOLDFIELD, AUSTIN, ROCHESTER, AND DIVIDE.

GOLDFIELD.—The Goldfield Development Co. is extending the main drift from the 380-ft. level of the Combination into the Florence Goldfield in order to intersect the Riley lease workings. It is expected that they will be cut within 300 ft. This area has produced much high-grade ore, and has extensive new territory inviting development. The company has given a lease on the Combination No. 2 claim to the Florence Goldfield Co., which has started exploratory work from the 350-ft. level. Ore sampling \$52 per ton is being opened in the Red Top mine above the 120-ft. level, and A. I. D'Arcy, the manager, estimates 400,000 tons of profitable ore indicated in this area, instead of the 200,000 originally computed. The Red Top and Combination deposits above the 200-ft. levels are to be worked by the glory-hole method, and the 1,500,000 tons on the 380-ft. workings of the Combination by the caving system. Red Top ore will be mined through the first level of the Laguna shaft, and the Combination output by way of the January shaft on Combination Fraction ground. The January shaft has been provided with the powerful electric hoist formerly in operation on the Mohawk shaft. Mr. D'Arcy estimates the 1,500,000 tons of ore in reserve on and above the 380-ft. level of the Combination averages \$5.60 per ton, which should yield the company a net profit of \$3,000,000. The 1200-ton Consolidated mill is being provided with new belts and is scheduled to go into commission early in September.

R. C. McCarthy, superintendent of the Florence Gold-

field, reports that the extension of the Jumbo vein beyond the east-west fault in the Florence has apparently been found on surface. At point of discovery the vein is 60 ft. wide, strikes to the south, and was found on the Cornishman claim. Cross-cutting has started from the seventh level to explore the vein. Shipments of high-grade ore continue to be made from the 400-ft. level by the Florence Divide lease and from the seventh level by the Giles lease. The Crackerjack company has arranged for extension of a cross-cut to the Crackerjack veins as soon as the winze reaches a depth of 440 ft. On the 380-ft. level the vein is 18 ft. wide with 8 ft. sampling \$25 per ton in gold and silver. Ore is to be sent to the Consolidated mill as soon as the capacity is increased to 2000 tons per day. Construction of an aerial tramway from the Crackerjack shaft to the mill is under consideration by H. G. McMahon, the manager.

AUSTIN.—Ore containing native silver and free gold has been struck in the main tunnel of the Austin Nevada Consolidated, according to an announcement by H. G. Richardson. Two high-grade veins have been cut and work is proceeding to determine extent of the deposits. The tunnel is advancing on an orebody 73 ft. wide sampling \$8 per ton. The material is badly leached. To the east of the main tunnel an orebody in porphyry is showing a width of 70 ft. Plans for a mill are under consideration.

ROCHESTER.—Shipments of selected ore from the Abe Lincoln mine, on Gold hill, have been started by Rochester Lincoln Hill Mining Co. The vein ranges from four to eight feet wide and has been opened to a depth of 100 ft. by a tunnel. Shipments average around \$100 per ton, silver predominating. John L. Munzer, of Pittsburgh, Pennsylvania, is president, and W. H. Scott, of Rochester, secretary.

DIVIDE.—Figures prepared by W. A. Ingalls, sheriff of Esmeralda county, while assessing in the Divide district, indicate that not less than 600 men are employed there. Sheriff Ingalls estimates that there are 80 plants of machinery being used in mining in the district.

E. A. Byler, engineer for the Florence Goldfield, estimates the production of the mine for the past 30 days at \$109,430, all ore being mined by lessees. Control assays made by the Florence company on the recent large shipment from the Florence Divide lease indicate the total value of the shipment will be \$93,033. It is improbable that the gross value of the shipment will be more than this sum, according to Mr. Byler. The gross value of 36 tons shipped by the Giles lease was \$10,097, according to smelter returns. The net value was \$8986, of which \$6403 was the share of the lessees. Since the rich shipment the Florence Divide has sent to the smelter 170 tons of ore of an estimated total value of \$5100. The Arnold lease shipped a carload valued at \$1200. The Goldfield Development Co. on August 15 shipped the first ore to the mill. These shipments, which are being made from the Red Top, will be continued until the 5000-ton mill-bins have been filled. The company now employs 125 men in the mines and mill.

WASHINGTON

GENERAL NEWS OF FERRY COUNTY.

FERRY COUNTY.—E. N. Patty, mining engineer for the Washington State Geological Survey, is at Republic, examining the mines of the district to obtain information for a report on the metal mines of the State. He has been working here quietly for 10 or 12 days and has already been through Stevens, Okanogan, and Pend Oreille counties and lately visited Park City, Nespelem, and Sheridan camps, which are partly in Ferry and partly in Okanogan counties. Keller is reported to be on the eve of a boom, and evidently there is capital going into that camp. A Mr. Blevin, of Spokane, representing the Northwest Mines & Metal Co., is reported to have bought several claims on Meadow creek belonging to J. E. Jannot and a Mr. Colby, and will soon begin work on them. Work is progressing rapidly in the adit of the Addison mine, with still a long distance to run. The Illinois Mining Co. is expecting to send a representative into camp to direct operations.

WISCONSIN

HIGHLAND, LINDEN, LIVINGSTON, CUBA CITY, BENTON.

HIGHLAND.—The New Jersey Zinc Co. has developed and equipped four new carbonate zinc-ore producers in this camp, called the Eberle, Esch, Topp, and Minter mines. Shipments of ore run from 4 to 10 cars weekly, the ore going to the company's smelters at Depue, Illinois.

LINDEN.—Ross Bros. Mining Co. has picked up an extension of the Ross range, one-half mile north-east of workings mined profitably for 12 years. The surface rig will be removed to the new mine-site and a two-compartment pump and hoist shaft will be sunk without delay.

LIVINGSTON.—The Vinegar Hill Zinc Co. (Marks Mfg. Co., Chicago, owners) has resumed operations with a force of 100 men on the Yewdall and Dale mines after a shut-down of six months. A new concentrator is in operation for the first time. The plant and mines represent an investment of \$200,000.

CUBA CITY.—The Zinc Hill Mining Co. has developed two new zinc mines in this district, known as the Little Dick and Big Dick. On the former a strong vein of sphalerite is followed on a mining level only 130 ft. deep. A new mill is recovering concentrate assaying 54% zinc. The shaft on the Big Dick, completed August 1, is in zinc ore at a depth of 108 ft. Charles Wolf, president and general manager, has been authorized by the Zinc Hill directorate to expend the sum of \$100,000 for further exploration work in the zinc areas of the Wisconsin field. Leaseholds have been obtained on 5000 acres of land, most of which is contiguous to abandoned properties. A battery of five drill squads is proving this ground. Electro-static ore-separating plants will be installed at convenient points. Connecting Link Mining Co., a newly developed zinc-ore producer, is shipping 4 to 6 cars of low-grade zinc concentrate weekly.

Big Eight Mining Co. is resuming on the Roosevelt range. The National Ore Separators and Linden Zinc Co. are handling from 1000 to 1500 tons crude ore weekly.

BENTON.—The Wisconsin Zinc Co., operating the C. A. T. mine, Champion, Longhorn, and Winskill mines, is leading the field on production and through its roasters is marketing large quantities of premium-grade blende. The New Jersey Zinc Co. has two producers in this camp, the Penna-Benton and Hoskins mines. The latter has yielded as high as 20 cars of crude ore in a single week. Frontier Mining Co. is actively engaged with the Bearcat, Middle, Bull Moose, and Hird mines. The Indian Mound Mining Co. is shipping regularly. The Rodhams mine, an indifferent zinc ore and lead ore producer for several years, has blossomed out recently and is now engaged in shipments of zinc ore to local refiners at the rate of two cars daily. Heavy overflow is giving the Jefferson and Monmouth producers a battle, but men manage to get below at intervals and shipments of two cars of zinc ore per week is maintained. The Graham mine at Millbrig is good for five cars weekly; North Unity mine, three cars weekly; Blewitt mine, four cars weekly; and Black Jack mine at Pilot Knob, five to seven cars weekly. The Galena-Joplin ore-separating plant, after a protracted period of idleness, is again in active operation, affording low-grade producers an avenue of outlet through ore-dressing now available at this plant. The Eagle-Picher company has purchased the Lanyon smelter at Hillsboro, Illinois, and a new buyer for the Eagle-Picher has been established in the Wisconsin field. The United Zinc & Smelting Co. is also newly represented in this field.

BRITISH COLUMBIA

FAILURE OF THE FRENCH PROCESS. GENERAL NEWS OF THE PROVINCE.

The Complex Ore Reduction Co., Ltd., which was organized some time ago to develop the French process for the extraction and electric precipitation of zinc from complex zinc-lead ores, has closed down, and Mr. Thomas French, son of the inventor of the process, is leaving for eastern Canada. The company was backed heavily by the British Columbia government, which guaranteed the bonds to the extent of \$65,000. This, of course, the Government will lose. The recent report of the Hedley Gold Mining Co., operating the Nickel Plate, in the Osoyoos district, shows that 67,313 tons of ore was mined, 20,028 tons of which had an average grade of \$11.18, while the balance ran \$9.99. There was an ore-reserve of 263,000 tons averaging \$9.40 per ton and 87,000 tons averaging \$6. The net earnings were \$132,578, of which \$108,000 was disbursed in dividends. At the annual meeting of the Cork-Province Mines, Ltd., in the Ainsworth division, it was decided to retire the present 8,250,000 ten-cent shares, and issue in their stead 1,250,000 dollar shares. With the difference the outstanding bond issue of \$16,250 will be retired and the balance spent in develop-

ment. Extensive improvements were made to the mill last year, including a 14-cell Minerals Separation plant, three Wilfley tables, and a boiler and heating plant. A new bunkhouse also was built. At the Standard mine, near Silverton, 20 men are employed developing a new orebody. The mill is in operation again. It is reported that the Granby company will dismantle the Grand Forks smelter. A quantity of quartzose ore that was at the smelter is being shipped to Anyox. A number of new discoveries are reported from this and surrounding districts. An orebody 5½ ft. wide and assaying 176 oz. in silver has been struck in the McAllister mine on Carpenter creek. The orebody carries a 12-in. streak of rich sulphide ore that runs considerably higher. A sample of compact sulphide ore from a 12-in. vein on the Tenderfoot claim, near Copper creek, Kamloops lake, is said to run over \$1000 in gold, silver, lead, and copper combined. Ore running 6 oz. in gold and 60 oz. in silver is reported from the Gold Bug property, above Ferguson. An 18-in. vein on Mascot No. 3, near Sandon, assays from 52 to 318 oz. in silver and 50% in lead. An interesting find is reported from the Rio Tinto claim, near Nelson. An assay report gives \$12 in platinum and \$5 in gold.

MANITOBA

GOLD DISCOVERY EAST OF FLIN FLON.

A rich gold discovery has been made at Copper Lake lying east of the Flin Flon copper mine and about 70 miles north of The Pas, Manitoba. The original find was made some time ago by Jacob Cook, an Indian prospector, and later while examining this, J. P. Gordon, formerly chief engineer of the Hudson Bay Railway, made a further find of extraordinary richness. The vein, stated to be six feet wide, contains lumps of quartz, some of them weighing many pounds, matted by string and leaf gold which appears to form half the mass. The genuine character of the discovery is vouched for by Dr. R. C. Wallace, commissioner for Northern Manitoba, who states that he has never in his experience seen gold samples of equal richness. As soon as the discovery became known a rush of prospectors from The Pas took place and a large number of claims have been taken up. The vein has been followed for a distance of 6000 ft.

ONTARIO

REORGANIZATION OF DAVIDSON GOLD MINES.

PORCUPINE.—The Davidson Gold Mines is to be reorganized with a capitalization increased to \$5,000,000 in shares of \$1 par value and will be known as the Davidson Consolidated Gold Mines. The company's property of 120 acres will be consolidated with adjacent territory, enlarging it to 420 acres. After making this purchase and distributing to the shareholders a bonus of one share in the new company for every three shares in the original concern, a balance of 1,000,000 shares will remain in the treasury, of which 500,000 will be offered for sale at 75c. each to raise funds for development on an extensive scale.

SUSPENSION OF ASSESSMENT WORK TEXT OF JOINT RESOLUTION

Last week we noted here the passage of House Joint Resolution No. 76 suspending the annual assessment work of \$100 required on mining claims, although at the time we did not have the text of the resolution at hand. This has now been received and shows that the suspension is until December 31, 1919, instead of 1920 as was first supposed. The text follows:

'Resolved by the Senate and House of Representatives of the United States of America in Congress assembled, that the provision of section 2324 of the Revised Statutes of the United States which requires on each mining claim located, and until a patent has been issued therefor, not less than \$100 worth of labor to be performed or improvements aggregating such amounts to be made during the year, be, and the same is hereby suspended during the calendar year 1919; Provided, that no such suspension shall be granted to any one claimant for more than five claims; Provided, that every claimant in order to obtain the benefits of this resolution shall file or cause to be filed in the office where the location notice or certificate is recorded, on or before December 31, 1919, a notice of his desire to hold said mining claims under this resolution.

"Section 2. That this resolution shall not be construed to alter, modify, amend, or repeal the public resolution entitled 'Joint resolution to relieve the owners of mining claims who have been mustered into the military or naval service of the United States as officers or enlisted men from performing assessment work during the term of such service,' approved July 17, 1917."

Van H. Manning, Director of the U. S. Bureau of Mines, at a recent visit in San Francisco called attention to the urgency of the oil situation in this country, and made a strong plea for American capital to enter the petroleum fields of foreign countries. He said in part:

"No other situation is so critical and so urgent in its bearing on our commerce and industry as the petroleum situation. The United States is consuming more crude-oil than it produces, and the deficit is made up by imports. Forty per cent of our natural petroleum reserves has been taken out and used. Of our coal supply we have used but 1%. And, in contrast with other nations, notably England and Holland, who control immense oil-reserves the world over, Americans have not entered the foreign field on a large scale. The only countries where American companies operate are Central and South America, Mexico, and Rumania.

"At present the United States holds the first place in the petroleum industry, and produces about 70% of the world's production. But we have to take into consideration our immense consumption, coupled with the fact, which is illustrated by the world's map of petroleum reserves, that many of the areas are now closed to us, since they are either in the possession of English or Dutch Nationals, or otherwise controlled by them. In fact, it may be said that the British and Dutch nationals exercise control over all the oil-industry that is not in the hands of American companies. Unless

every effort is made immediately by American capital to develop the remaining oil-reserves, the oil production of the future will be in the hands of foreign interests within a short time."

ARIZONA

Ray.—The Ray Consolidated Copper Co. has issued its report for the quarter ended June 30, 1919, showing gross income after charges of \$316,365, equivalent to 20c. per share (par \$10) earned on the \$15,771,190 capital stock, compared with net loss of \$152,298 in the preceding quarter and total income of \$2,253,217, or \$1.43 per share in the June quarter of 1918. Gross income after charges for the six months ended June 30, 1919, totaled \$164,067, equivalent to 10c. per share on the stock as compared with \$3,361,079, or \$2.16 per share in the same period of 1918.

CALIFORNIA

Crescent Mills.—Control of the Crescent and Green Mountain gold properties has passed to the Philadelphia Exploration Co. Comprehensive developments have begun on both mines, which formerly ranked among the best gold producers of Plumas county.

Downieville.—Gibraltar Mining Co. has been reorganized with Jacob Keiffer, president, and W. I. Redding, secretary. The tunnel is advancing to reach the gravel channel, and a raise is being holed through to the surface to furnish air to the deeper workings.

Graniteville.—William Moore has taken the Spotswood quartz property under bond and is extending the tunnel to reach the main orebody. Good ore was found above the lateral in past years. Driving for the vein is progressing in the W. L. Baker mine. Good ore has been mined in the upper levels and it is intended to operate the five-stamp mill as soon as the vein has been cut.

Placerville.—Under management of A. Baring-Gould operations have been resumed at Mount Hope quartz mine. A westerly tunnel on the north end of the group is 60 ft. from the portal. Old developments include a 1700-ft. tunnel and 275-ft. shaft. The equipment includes a steam and air hoist, compressor, and ten-stamp mill, all operated by water-power. The new tunnel at Georgia Hill gravel mine has advanced 150 ft. and will probably be driven 1500 ft. to tap the channel. A compressor has been installed and quarters for miners provided. Thomas A. Murray is arranging for increased operations at his Molybdenite group, 13 miles south-east of Placerville. Two distinct deposits have been exposed, one carrying molybdenite, the other high-grade copper.

Smartsville.—The 'Paddy' Campbell mine, known as the Blue Point, once valued at more than \$1,000,000, is to be sold for \$20,000, as disclosed in a suit filed by E. P. Fitzsimmons asking for the appointment of a receiver and an accounting.

COLORADO

Cripple Creek.—The El Paso Extension Mines Corporation has added to its holdings on Gold hill by acquiring control of the Lexington Gold Mining Co., owning the Clara D.,

Neille V., Cotton Tail, and Jeff Davis No. 1 and 2, a total of 12.58 acres on Gold hill. The Clara D. has produced a large tonnage of milling ore, but has been inactive for some years.—The El Paso Extension company has five sets of lessees active and producing at the Index and has recently installed a new electric compressor to furnish air for the machine-drills in use.—A 100-ft. lift in the Dexter shaft, under lease to Anderson and Benkelman, has been sunk in 18 days by C. G. Gorman and associate contractors. The Gorman interests will now cross-cut to the vein and ore-shoot on the Trail mine of the United Gold Mining Co., on which Anderson and Benkelman hold a lease that expires this fall. It is confidently expected the cost of sinking the shaft and driving the cross-cut, timbering, and cutting the station will be taken out in addition to profits before the lease expires.—G. R. Lewis, former postmaster and manager of the Copeland sampler, has been appointed superintendent of the United Gold Mines Co., a Carlton corporation controlled by the Golden Cycle Mining & Reduction Co., of which A. E. Carlton is also president. A campaign for lessees at lower royalties and better working conditions is to be undertaken. The company owns or controls about 400 acres of patented properties on Battle and Squaw mountains and Iron Clad and Bull hills in this district, now operated under the leasing system.

The orebodies recently encountered at depth in the Vindicator south-east of the shaft are holding up with development and the ore is above the average in grade. Ore from the discovery is reported shipping at between \$30 and \$40 per ton.—A new ore-shoot has been opened up by Charles Searles on the Jerry Johnson. The discovery was made by a raise from the eighth level. The shoot has now been proved by drift for 80 ft. in length and shipments of ore are reported to average about one ounce gold for coarse rock and two ounces for screenings.

La Veta.—On the morning of August 18 a serious explosion took place in the Oakview mine of the Oakdale Coal Co. At the time of going to press 18 men are believed to have been buried under the debris and killed. Rescue crews had recovered four bodies by night. Fume from the explosion filled the mine and several rescuers were overcome and were revived with difficulty. Owing to the wrecked condition of the mine and the gas fumes, it was considered doubtful whether the full death list could be learned for some time. Approximately 40 men were in the mine when the explosion occurred, including Fire Boss William Christopher. Ten men escaped through the main stope after the explosion, and ten others made their way to the surface through an adjoining mine. William Davis, a miner, one of those overcome by the explosion, recovered sufficiently to make his way to the surface. None of the others have been heard from. The explosion took place about a mile and a half from the portal.

IDAHO

Beaver Creek.—The Red Monarch Consolidated Mining Co. is preparing to resume operations on its property, according to an official. Dan M. Drumheller, Jr., a mining engineer, has been appointed superintendent, and has gone to the property. A crew of 10 to 15 men will be employed at the outset.

Big Creek.—High-grade silver ores found in the Big Creek district are attracting unusual attention and several well-organized prospecting expeditions have recently gone into that section to explore some of the iron-capped lodes. Two shipping mines are now in active operation, the Big Creek Leasing Co., operating the Yankee Boy, and the Big Creek Mining Co., both making regular shipments of high-grade ore, part of which is gray copper containing from 300 to 500 oz. of silver per ton, according to reports from that district.

Kellogg.—The Caledonia Mining Co. had a surplus of \$624,010 on June 30, according to a report from S. A. Easton, the president. This is an increase of \$198,618 over the surplus December 30 last. The dividends paid in the first six months of the year aggregated \$156,300.

Murray.—Satisfactory results are attending operations of the Bear Creek Mining Co., according to Patrick Burks, the president. The mill is handling ore and the movement of concentrate to the railroad is expected to begin soon.

Porthill.—The Idaho-Continental mine is in full operation with a total complement of 130 men in all departments. The operators have been shipping 60 tons of concentrate daily since the roads became solid enough to haul ore over, which was on July 22. They are using 12 motor trucks between the mine and the railroad at Porthill.

Wallace.—A walkout of practically all the miners of Burke, Mullan, and Nine Mile districts of the Coeur d'Alene occurred on August 15 following a vote by members of the International Union of Mine, Mill and Smelter Workers. More than 1500 miners are out as a result of the strike, which was called against the advice of the international representatives of the union and in spite of the efforts of Robert M. Wade, federal mediator. The men demand an eight-hour day "from portal to portal"; increase in their wages from \$5.25 to \$5.75; and recognition of the union.

This strike was preceded by a small one the day before at the Interstate-Callahan, when 100 employees walked out. A meeting had been held and a committee appointed to wait upon Manager Newton and demand six hours per day "from portal to portal" and \$1 per hour for this abbreviated shift. The committee, however, seems to have lacked the courage to present this demand in person, so the information was conveyed to the manager in a note left where he would be sure to find it. Neither did they wait for a formal reply to the demand, probably and very properly assuming that it would be promptly denied. Without hearing from the management 100 employees drew their time this morning and came down the hill. This action, which was entirely independent of the miners' union, indicates that the Interstate-Callahan had inadvertently gathered in a goodly number of 'wobblies' while recruiting a force to resume operations.

MICHIGAN

Houghton.—Production of refined copper from the Calumet & Hecla and subsidiary mines for the month of July was 6,207,519 lb. The output by mines follows:

| | Pounds |
|-----------------------|-----------|
| Ahmeek | 958,500 |
| Allouez | 150,100 |
| Calumet & Hecla | 3,292,821 |
| Centennial | 76,002 |
| Isle Royale | 935,150 |
| Osceola Con. | 651,000 |
| Superior | 35,025 |
| White Pine | 95,444 |

The most impressive increase in July over June was made by Isle Royale, which showed an increase in output of nearly 50%.

NEVADA

Ely.—Emmet D. Boyle, Governor of Nevada, has gone to Salt Lake City for a conference with R. C. Gemmell, general manager of the Utah Copper, respecting the strike situation at Ely, in which employees of the Nevada Consolidated Mining Co. and Nevada Northern Railroad Co., associated interests, are involved. Governor Boyle conducted a personal examination of the strike situation at Ely and then went directly to Salt Lake City to lay the matter before officials of the Utah Copper Co. with a view to bringing about an amicable adjustment.

McGill.—The report of the Nevada Consolidated for the quarter ended June 30 shows a production of 11,149,362 lb. of copper, compared with 12,201,444 lb. in the previous quarter. The net profit was \$184,778, compared with a loss of \$111,159 in the quarter ended March 31.

The report says in part:

During the quarter 558,525 dry tons of ore of an average grade of 1.42% copper was treated, as compared with 529,692 dry tons averaging 1.79% copper for the previous quarter. No customs ore was offered for treatment during the quarter. The cost of production per pound of copper, including charge for depreciation of plant and equipment but without credit for gold and silver and miscellaneous earnings, was 18.07c. per pound. The value of gold and silver recovered and the miscellaneous earnings for the second quarter amounted to 4.61c. per pound of copper. The costs for the preceding quarter, calculated upon the same basis, that is, including charge for plant depreciation and the fixed and general expenses, but excluding credit for miscellaneous earnings, were 16.85c. per pound of copper. The credit for miscellaneous income for the first quarter, including gold and silver recovered, was 2.34c. per pound. The operating income upon which the earnings for the quarter are based is computed at 15.12c. per pound of copper, as compared with 13.6c. per pound for the preceding quarter. This slight increase in the carrying price is due to the fact that the sales of copper during the quarter were increased to some extent, all unsold copper being carried as usual at 13.5c. per pound. The actual sales of metal for the quarter, however, did not equal the production for the period, which resulted in a further increase of unsold copper on hand and in transit. A general improvement in industrial conditions at this time would seem to indicate a slow but gradual increase in domestic consumption and a decided stimulation of foreign demands. While this fairly well defined improvement in the copper market gives promise of further expansion, the management has considered it advisable to continue the output of copper on the present basis of curtailment until some portion of the company's accumulation of copper stocks can be marketed to advantage.

NEW MEXICO

Hurley.—The report of the Chino Copper Co. for the second quarter of 1919 shows an operating profit of \$44,031 and a deficit after dividends of \$282,069. Production for the three months amounted to 10,541,000 lb. of copper compared with 11,512,133 lb. for the previous quarter. The total amount of ore treated for the three months was 401,100 tons, equivalent to an average of 4408 tons per day, or 1083 tons less than that milled for the first quarter of 1919. The average assay in copper was 1.83%, compared with 1.80% for the first quarter of 1919. The ore milled during the second quarter was considerably more favorable to concentration than that treated during the previous quarter. The recovery per ton of ore milled for the quarter was 26.28 lb. of copper, as compared with 23.29 lb. for the first quarter of 1919. The cost per pound of net copper produced from milling operations for the second quarter, after allowing for smelter deductions and including depreciation, was 14.16c. as against 15.03c. for the first quarter of 1919. The cost figures do not include any charge for Federal income excess-profits taxes, nor do these costs take into consideration miscellaneous income. There were no gold and silver credits from the concentrate produced during the second quarter. The above figures are based on a carrying price for copper of 14.60c. per pound for the second quarter of 1919, which was calculated in the usual manner by inventorying all unsold copper at 13c. per pound. The figures for the first quarter of 1919 were based on a price of copper of 13.04c. per pound.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

A. N. Mackay is in Colombia.

A. H. Ackerman is in Transylvania.

Arthur L. Pearse writes from Atlantic City, New Jersey.

C. V. Corless has left Coniston, Ontario, on a visit to England.

F. W. Bradley is on his way between Fairbanks and Juneau.

Courtenay De Kalb is expected in New York on his return from Spain.

H. A. Titcomb is leaving England to take up his residence in New York.

Louis A. Wright is returning to New York, after a couple of months holiday in California.

Morton Webber has returned from Mexico and is now at the Empire mine, at Mackay, Idaho.

H. A. Guess, of the A. S. & R. Co., has been examining properties in the Portland Canal district.

A. W. Grierson has been appointed manager for the Kirkland Combined Mines, at Kirkland Lake, Ontario.

S. G. Blaylock became general manager for the Consolidated Mining & Smelting Co. of Canada on August 1.

J. Parke Channing will attend the Industrial Conference at Silver Bay, Lake George, New York, on August 29.

L. J. Mayreis and W. R. Degenhart have arrived in London from the Bawdwin mine of the Burma Mines company.

Charles F. Hazelton, on his return from France, where he served with the 27th Engineers, has gone to Victor, Colorado.

E. H. Clausen has returned from New York to San Francisco and is going to Caliente, California, to take charge of the Zenda mine.

William J. McBride, chief metallurgist to the Broken Hill South Co., of Broken Hill, passed through San Francisco on his return to Australia.

Reginald E. Hore has resigned the editorship of the 'Canadian Mining Journal', and is succeeded by F. W. Gray, formerly Associate Editor.

W. A. Meloche, who served with the 115th Engineers, has returned from France and is now on his way to the Hazelton district of British Columbia.

A. H. Jones has resigned as mill superintendent for the Tonopah Belmont Development Co., to join the Butters Filter Co., at Salt Lake City.

H. H. Yuill, Colonel, D. S. O. and M. C., recently Controller of Mines in the B. E. F., has joined the firm of Bainbridge, Seymour & Co., in London.

Rene J. Mechin has resigned as engineer to the Nacozari Consolidated Copper Co., to accept a position as engineer with the Santa Gertrudis company at Pachuca, Mexico.

H. W. Stotesbury, after 12 years service, has resigned as engineer and superintendent for the Tonopah Mining Co., and will establish himself in consulting practice at Los Angeles.

Harold N. Lawrie, chairman of the Board of the Oregon Bureau of Mines and Geology, has accepted the active chairmanship of the Division of Precious and Rare Metals in the American Mining Congress.

Van H. Manning, Director of the U. S. Bureau of Mines, was in San Francisco last week. On August 15 he was entertained at the Engineers Club and delivered an interesting address on the activities of the Bureau.

THE METAL MARKET

METAL PRICES

San Francisco, August 19

| | |
|--|-------------|
| Aluminum-dust, cents per pound..... | 50—60 |
| Antimony, cents per pound..... | 10.50 |
| Copper, electrolytic, cents per pound..... | 23.50 |
| Lead, pig, cents per pound..... | 6.25 |
| Platinum, pure, per ounce..... | \$105 |
| Platinum, 10% Iridium, per ounce..... | \$121 |
| Quicksilver, per flask of 75 lb..... | \$100 |
| Spelter, cents per pound..... | 9.75 |
| Zinc-dust, cents per pound..... | 11.00—13.50 |

EASTERN METAL MARKET

(By wire from New York)

Aug. 19.—Copper is more active and higher. Lead is quiet but advancing. Zinc is more active and stronger.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

ORES

Tungsten: The market has been lively in the past week, and for the first time in many months business has been done in Bolivian wolframite of high grade at \$10 per unit. Inquiries are more numerous. For scheelite buyers and sellers cannot get together on price. Chinese ore is quoted at \$7.25 to \$7.50 per unit. There appears to be an understanding that the Central Powers cannot buy ore, except with the permission of the Economic Council, and representatives of the trade have written B. M. Baruch on the subject. Verbally, Mr. Baruch replied there is no objection to trading with the Central Powers, and that the Council has jurisdiction only on the credit end or the exportation of gold in payment.

Molybdenum: The market remains dull with quotations ranging from 75 to 85c. per pound of MoS₃ contained. Chrome Ore: More demand is reported for ore, the quotation for which is \$25 per ton, f. o. b. California, common point, or 80c. per unit delivered Pennsylvania plant.

Manganese-Iron Alloys: The chief feature of the week is the sale of 2000 to 3000 tons of English ferro-manganese at a price under \$105, seaboard, which was recently quoted and believed to have been about \$100. Domestic producers can be depended to meet the foreign makers' price as they have done heretofore. Representatives of the English makers say they did not name the new low price, but accepted a firm offer made to them by consumers.

Spiegeleisen is strong at \$35 for 18 to 20% material.

FOREIGN EXCHANGE

During the week sterling, francs, and lire all declined steadily without notable rallies, establishing new low records. The most pronounced weakness was in the Continental rates, especially lire. It should be remembered that the low for lire during the War was 9.15½. At 9.25 the lira has a value of 10.5c. in U. S. currency against a normal of 19.3c., a discount of 44%. Meanwhile, the Germans are reported to be endeavoring to bolster the mark a little by requiring that marks to the credit of foreign exporters must remain in German banks for a year, amounting practically to an involuntary grant of credit. Were it not for such tactics it is surmised that the mark would be quoted under its present record low of 5.25c., which compares with a normal of 23.8c., a discount of 78%. Some Germans are reported to be evading the new rule by paying cash for much needed materials, while on this side bankers are refusing to buy commercial bills unless guaranteed against the one-year tie-up.

Quotations on August 19 are as follows:

| | |
|-----------------------|--------|
| Sterling: Cable | 4.22 |
| Demand | 4.21 ½ |
| Francs: Cable | 7.95 |
| Demand | 7.97 |
| Lire: Demand | 9.25 |
| Marks | 5.25 |

Eastern Metal Market

New York, August 13.

The general situation in metals is one of quiet, with the producers of copper, lead, and zinc sitting back and letting second-hands take what small business is stirring. The makers quite generally are holding firmly to their prices, the concessions all coming from second hands.

Copper is lower, but is now showing a slightly more favorable trend.

The nominal quotation for spot tin—70c.—has about been eliminated because of the arrival of shipments from abroad. In the first half of August several hundred tons arrived, with more in sight, and free trading will be resumed August 15.

The leading lead interest adheres to 6c., New York; outsiders are quoting down to 5.60c. in a dull market.

Spelter is quiet but fairly firm, with several producers still out of the market.

Antimony is a little lower.

IRON AND STEEL

Laber troubles are seriously hampering steel production in some sections, the railroad shopmen's strike in particular hitting South Chicago and Gary, Indiana, hard. In these districts blast-furnace operation has been reduced, with consequent lessening of activity on the part of steel mills. At Cleveland, with the same cause, the American Steel & Wire Co. is idle in all departments. On the Lakes, the movement of ore has been stopped by a strike at upper Lake docks, the men wanting a 30% advance in wages. The unionization of steel-plant employees is being conducted with vigor, but not much fear is entertained of the result in this direction. The movement, however, is not being overlooked. Southern (Alabama) pig-iron is stronger, several makers advancing their base price 50 to 75c. per ton. The general tendency among the producers of steel is not to advance their prices, but here and there some products have advanced, as in galvanized sheets, nuts, bolts, and rivets, and boat spikes and cut nails. Steel-ingot production in July was 2,984,856 gross tons, the daily rate increasing to 114,802 tons, as against 105,639 tons per day in June, an increase of 8.7%. The July output was at the rate of 35,000,000 tons per year, or 17% less than the average for last year.

COPPER

In a dull market prices pursued a downward tendency in the week, the declines recorded being traceable more to sympathy with the London market than to any other cause. This week, however, the London market has become firmer. Another strengthening influence has been the better tone of the stock market, which broke badly last week. The large consumers of copper are well supplied with the metal, and producers see no reason why they should recede from their quotations of 23.50 to 24c. for electrolytic. Second-hands have been the factors which quoted the lower prices, there being reports of offerings yesterday as low as 21c., although 21.50c. is probably nearer the market. Lake has not declined proportionately and is held around 22c., but is scarce. Aside from the filled-up condition of consumers a further influence making for a quiet market lies in the many uncertainties in costs of labor, fuel, and freights. Good news from Rome, New York, is that the copper and brass companies there have settled their difficulties with their men and the latter have returned to work. Exports are expected to increase in volume in the near future. The Bureau of Foreign and Domestic Commerce has issued a

statement saying that 19,842,478 lb. of unrefined black blister and converter copper in bars, pigs, or other form was imported in June, and that 24,250,659 lb. of refined copper and ingots, bars, or other forms was exported. Of copper wire, other than insulated, 4,766,354 lb. was exported in the same month.

TIN

In the near future there will be a change in the nominal price of 70c. for spot Straits tin. Free trading will be resumed August 15, and the market already feels the effect of recent arrivals of the metal and the near arrival of still more. Since August 1, 350 tons of tin has arrived, and at least three ships are due, each of which is bringing tin. As the availability of the tin afloat comes nearer it is certain that its price and that of actual spot metal will draw closer together until the two strike a compromise. On August 11, October delivery at the East was quoted at 52.25c.; November from the East at 52c.; and afloat from England at 54.40c. September to December shipments from the East were offered at 51.75c., Lamb & Flagg for prompt shipment at 51.50c., and Straits, September shipment from England, at 53c. The price situation is unsatisfactory with such a range as has existed, to say nothing of being puzzling to many, and the restricting of prices to narrower ranges will be welcomed. From March to July, inclusive, no tin arrived at United States Atlantic ports, and but very little in the first two months of the year. In those months large government stocks were available at fixed prices, and under restrictions.

LEAD

Not much can be said about the lead market in comparison with conditions of a week ago. Second-hands continue to dominate the market, their New York quotation being around 5.60c., New York, some independents quoting higher. The leading interest continues to quote 6c., New York. At St. Louis the weakness is not so pronounced. As in copper, the large consumers are well supplied, and the leading producer is apparently content to leave the market to outsiders, and, it is believed, will continue to pursue this course for the time being. It is reported that Government stocks of lead, which totaled 30,000 tons January 1, have been reduced to about 3000 tons, as of August 1, the remainder having gone into consumption.

ZINC

Makers of zinc are not pressing for sales, and the market has pursued a fairly steady course, despite quiet. Some of the large producers continue out of the market, the plants of some being down. Prompt was quoted August 11 at 7.60c., New York. Exports of zinc in June (in pigs, slabs, etc., produced from domestic ore) totaled 18,489,575 lb., France taking 9,406,822 lb., England 5,247,759 lb., Belgium 1,691,200 lb., and Italy 1,377,113 lb. These figures are given by the Bureau of Foreign and Domestic Commerce.

ANTIMONY

Quotations are lower, spot now being quoted at 9c., New York, duty paid. No business worthy of note is reported, except that the bulk of the Government's surplus stock of antimony has been sold, a Chinese buyer taking most of it.

ALUMINUM

The market for 98 to 99% pure virgin metal is about 32c., bidders, offering 31c., while the leading interest asks 33c. Some French aluminum which was offered at 31c. has been absorbed, and higher prices are being asked for future deliveries from that source.

G-E Centrifugal Compressors

THE performance of the first unit purchased resulted in the installation shown above. These units may be supplied in capacities up to 60,000 cu. ft. per minute and pressures up to 30 lbs. per square inch, and are supplied with either motor or steam turbine drive.

43-292

General  **Electric**
General Office **Company** Schenectady, N.Y.

WE publish a humorous exchange of letters with the manager of a mine at Jos, in Northern Nigeria. Obviously it ought to be spelled 'Josh', but the reader will not mind that. The troubles of our friend in western Africa are not unlike those of mine managers elsewhere, therefore the incident will call for amused sympathy.

DR. COUDEN, the blind chaplain of the House of Representatives, has been 'called down' by the Speaker, a Republican, for mentioning the League of Nations favorably when addressing the Deity. It is not said whether it was feared that his prayer might cause a schism in Heaven, or that the powers above, not understanding domestic politics, might be misled, or that the courts on high had signified their reprobation of entangling alliances.

IN a speech made before the Commercial Club in San Francisco, Dr. Butler, the president of Columbia University, referred to the expansion of currency as a prime factor in raising the cost of everything. He stated that in 1907 the currency of France was $7\frac{1}{2}$ billions, whereas in 1919 it had increased to 40. In the United States the circulation of money in 1881 was about \$20 per capita; in 1901, it was \$30; in 1914, \$40; and in 1919 it was about \$50.80. The newspapers that recorded his interesting speech also described the railway strike at Los Angeles and made mention of the loss of perishable merchandise, especially fruit, caused by the stopping of local traffic. Strikes represent an important element in raising costs, because they involve not only wastage of perishable commodities, but a cessation of productive labor.

SENATOR PHELAN wants the Governor of California to call a special session to pass a law prohibiting the foreign ownership of oil-lands in this State, while he is protesting against the plans of the Mexican government to confiscate the oil properties owned by our nationals in Mexico. On another occasion he undertakes to tell Great Britain how to manage the Irish, while the negro problem in the United States is taxing not his best thought, it may be, but that of his colleagues in the Senate. Thus does the ache for notoriety drive legislators into laughable inconsistencies. A sense of the ridiculous might save them from foolishness. Incidentally, we note that according to official figures issued by

the Mexican government, the British group headed by Lord Cowdray and now controlled by the Royal Dutch-Shell combination has acquired 2,431,000 acres of oil-land in Mexico, whereas the Doheny American group has acquired 586,692 acres, out of a total of 5,436,271 acres now in the hands of foreign corporations.

ATTENTION is drawn by the 'Manufacturers Record' to an affidavit of Mr. Harry O. Tucker, quoted before the Ways and Means Committee of the Senate, in which this traffic manager for the American Trona Corporation testifies to the fact that Herr Paul Freundrichsen, propaganda manager for the German Kali Syndicate, told him and others that the Trona Corporation was "foolish and unwise to invest money in a potash reduction enterprise in the United States for the reason that the German Kali Syndicate and the Imperial German government would after the conclusion of the War absolutely destroy the American potash industry by marketing the German potash in the United States at such low figures as to absolutely preclude and bar any and all competition." This sort of thing was said several times three or four months before the United States entered the War. The affidavit is dated February 7, 1919.

GEORGE ADE tells the story of a young man who was kicked in the head by a mule and "thereafter believed everything he read in the Sunday newspapers." In that weekly scrap-book the 'Literary Digest' we read a quotation from the Springfield 'Republican' in which existing conditions in Mexico are said to resemble the crisis in the Transvaal before the Boer war, "when the prize was the possession of the new gold mines of South Africa". The Springfield 'Republican' is one of the best newspapers in the country and we wish there were more like it; therefore we are all the more surprised to see this old myth revived in such intelligent quarters. We know something about the mines of the Transvaal and their ownership, as most mining engineers do, and we can say that the ownership of those mines was vested in the stockholders of the companies that operated them before the Boer war, and after it; and those stockholders were chiefly British, German, and French, but while the British held the majority they did not hold the plurality of the shares. If the same stockholders are not in possession now it is not on account of the Boer war but

because the controlling financial houses, chiefly of German-Jew origin, sold to the public while the quotations were still inflated by fictitious prospects of indefinite persistence of ore in depth.

SHOULD one keep faith with a bandit? An agreement had been made to pay \$15,000 as ransom for the two aviators captured by the Mexican bandits near Candelaria and the money was taken to a specified spot by Captain Leonard F. Matlack. He paid half the money and then contrived to escape with the remainder, together with the two captives. As he rode off he shouted to the bandits "You can go plumb to hell!" It is stated that General Dickman "instructed officers at Candelaria to pay the Mexican bandits the full \$15,000 as stipulated in the agreement made with them by the United States government". We salute the General. He is right, of course. It is as necessary to keep faith with a bandit as with a bishop; more especially should officers of the Army and representatives of the Government keep their word, no matter who may be the party of the second part. Have you heard of the War Minerals Relief affair? Let us play the game, even if the other fellow deals from the bottom of the pack. Moreover, there is a good practical reason for carrying out an agreement of this kind with bandits, in Mexico or elsewhere. The next time they capture one of our friends, it may prove impossible to ransom him because of our breach of faith or it may be that the bandits, imitating our smart tactics, may seize the messenger with the money and retain both it and the captive. An honest man loses his main advantage over a crook when he disregards, even momentarily, the obligations of his own code.

THE trial of the Elm Orlu v. Butte & Superior case was concluded on August 25, having lasted four weeks. It was remarkable for the elaboration of testimony. Plaintiff was represented first by Mr. Rush J. White, the engineer that has had charge of development work underground during the last three or four years; then came Mr. Fred Searls, Jr., a brilliant young geologist from San Francisco; he was followed by Mr. James F. Kemp, who needs no introduction, and then by another eminent geologist, Mr. Charles K. Leith, after whom came Mr. William B. Fisher, a mining engineer who testified as a practical miner. The sixth and last witness for the Elm Orlu was Mr. Horace V. Winchell, the president of the Institute. On the other side, that veteran expert and distinguished mining engineer Mr. Walter H. Wiley opened for the defence; he was followed by Mr. Samuel Barker, who has had charge of development work for the Butte & Superior; then came Mr. W. H. Emmons, the author of 'The Principles of Economic Geology', and after him Mr. Carl Hahn of Los Angeles. Our friend Mr. Alfred Burch was the next to testify and Mr. Darcy C. Bard, formerly professor in the Butte School of Mines, but now at Seattle, completed the testimony. These gentlemen have differed on the interpretation of facts, rather than on the facts themselves. Each

mine has 12 levels, which overlap, one set being uniformly 40 feet below the other, so that 24 levels and numberless cross-cuts have to be examined and considered by the witnesses. Six miles of drifts are involved. There are ten raises from 500 to 1200 feet long, making about a mile and a half of vertical openings that have to be carefully scrutinized in search of clues to the structural geology of the ground under dispute. Unusual complexity of vein-intersections and fault-crossings have taxed the powers of observation even of men trained by experience to diagnose such conditions. A large proportion of these miles of workings was excavated for the purpose of the contentions presented by the litigants, and the other expenses incurred in the course of the litigation have been very heavy. We hope that the science of geology may be the gainer, and we would like to be told that the exploratory work done for litigious purposes had led, as in other Butte lawsuits, to the exposure of unsuspected orebodies.

IN a Utah newspaper we found an article intended apparently to boost Cherry Creek, an old mining settlement in Nevada that has been revived by the increased demand for silver. The local scribe, filled with enthusiasm, and nothing else, for Utah is now a part of post-prohibition aridity, became so bemused by his exuberance that he mixed his metaphors irretrievably. The article begins: "Demand for silver has become the modern Moses of many a Western State and with its staff of high prices has struck the rock in Nevada from which an abundance is beginning to flow. Back in the days of good silver prices many a town boomed into a city in the sagebrush state. Stages filled with investors flitted in and out of these places, trekked wearily over the desert wastes, stopping at night in sumptuous palaces of hospitality, surrounded by life intense, keyed to its highest pitch, where great engines on the hillside fairly bellowed animation, mills roared over their rich harvest of metal and money was as liquid as the beverage it bought and the roulette wheels that it set moving smoothly. It was a chapter in western history such as may never be repeated. Then followed the blight of low prices." Imagine a demand having a staff wherewith to strike the rocks of Nevada; stages so light and airy as to flit in and out of the booming cities of the sagebrush plain; great engines that bellowed like buffaloes and mills that roared like mountain lions; money liquid as roulette-wheels; and the blight that fell on these multifarious activities like the muffler on a boisterous exhaust. As our chronicler says: "It was a picture of darkest desolation." But from the darkness of this industrial death—we venture to proceed to say—there emerged the radiance of a new day when Cherry Creek, effulgent in the dawn, arose above the Lower Carboniferous limestone of the lower earth and hurled its victorious challenge at the stars, to the plaintive accompaniment of the wandering coyote and the cheerful chorus of the pollywog, whose anthem of rejoicing fell upon the awakening world like the first stroke of a master-hand upon a grand piano, and so forth *ad nauseam*.

High Costs

Agitation against the cost of living continues. Each day the press contains new accounts of hoarded food-stuffs seized by officials acting for the Department of Justice. What proportion of these seizures is really hoarded, in the sense of vast stocks deliberately withdrawn from the market to create an artificial scarcity and corresponding high prices, and what proportion is merely laid by in time of plenty with the legitimate purpose of use in time of scarcity, is difficult to determine at present on account of the popular clamor. There is the story of the Californian bean-growers, who, in 1918, in response to the call for food production, started to produce beans intensively for the Government. When warfare ceased the Government stopped buying beans, whereupon the abnormal demand ceased and the market collapsed. The Californian producers were over-loaded with beans, they stored them in the hope of better prices, and in due course these hoards were 'discovered' and 'denounced'. Other examples could be quoted. The people are in an irritable mood, and doubtless in their wrath and ignorance of the problem of marketing some of the more perishable food-stuffs, the epithet 'profiteer' is applied to many who do not deserve it. Yet, from a sifting of the present rather unsatisfactory evidence, it seems fairly clear that much of the hoarding is not legitimate, but is done for the purpose of selfish gain at the expense of an already sorely tried people. The position of hoarders of that type is none too secure. Although on small issues partisan politics and petty graft usually transfer the real control of this country from the people to the leaders of the various political factions and machines, on large issues the people still rule, as many are likely to learn to their sorrow. When sufficiently stirred throughout the country, as the increasing cost of living has stirred them, the people are quite capable of raising an uproar that will rattle the windows of the Capitol at Washington and force through in record time any legislation that pleases them; and in that case the position of food-hoarders who cannot show a clean bill of health is likely to be made exceedingly unpleasant. But there is another side to this complicated and troublesome business. Much of the present abnormal cost of living is the result of diverting the agencies of production to destructiveness during the four years of the War. It should not be forgotten that money is nothing more than a medium of exchange, a convenient yardstick by which the product of one man is measured in terms of the product of another. True prosperity, that is, the condition where the conveniences and luxuries of modern life can be enjoyed by the many instead of the privileged few, can result only from the production being great enough to give everybody a share. This is the true measure of the cost of living: the amount of produce, in its larger sense, that people can exchange with each other. An unfair valuation of the labor of a small group, namely, the payment of wages disproportionately low, can deprive that group of some of its share; the vast

credit system by which modern business is transacted can work damage to individuals when the value of money fluctuates; the deliberate destruction of supplies—or hoarding them until they spoil—can reduce the small supply available and aggravate an already serious situation. These are grave matters that must be adjusted for the peace and happiness of the nation, but we should not forget that, compared with the fundamental factor of the quantity of goods produced, they are really only on the surface of things. Popular clamor that hurls itself at the minor issues instead of the underlying cause is like the physician who treats only symptoms while his patient grows steadily weaker under the ravages of some deep-seated illness. We have been glad to observe lately a tendency on the part of Labor to recognize this fact. We hear fewer objections to labor-saving machinery and to methods of increasing production. Labor seems to be realizing slowly that it is not a commodity in the sense that potatoes or meat is a commodity; that although the money that it receives for work may be governed by the laws of supply and demand, the goods that it can obtain in exchange for this money, which is the true measure of wages, increases only as the productiveness of Labor increases. In terms of money this simply means that if Labor is producing more than it demands for happiness and contentment, wages go up faster than the price of commodities; if Labor is producing less than it demands, the price of commodities—namely, the cost of living—goes up faster than wages. That is the present condition, and every strike, every increase of wages without corresponding increase of productiveness, only adds to the trouble. The situation now is further complicated by the masses in Europe who are as yet only consumers, which, being translated again into terms of money, means that the export of commodities for high prices increases the cost to those of us at home at the same time that it decreases the supply, without any corresponding gain in the import of those commodities that Europe makes particularly well. The true barter is labor for labor, goods for goods. Money is merely a convenient medium of exchange, and no amount of price-fixing or prosecution of profiteers and hoarders can alter this fundamental fact. These measures, if intelligently applied, can do much to alleviate the present situation, but they can never cure it. To do that it is necessary to strike at the root by stimulating production. We wish that the present outcry, which may, before it is done, prove well-nigh irresistible, could be thus directed on essentials instead of spending its valuable energy upon what must remain only a phase. If organized labor, while fighting for its idea of a square deal, could but see the issue clearly enough to direct its tremendous power to the increase of production, instead of to comparatively local squabbles over wages and strikes that but make matters worse, we might hope for a speedy betterment of conditions. We think we can see indications of this; hazy as yet, perhaps, but still fore-runners of better things. In the re-organization of our industries that is taking place Labor will inevitably obtain a more equitable division of the profits. It will

have a greater part to play in the management, a greater responsibility, and with these will come a more sober judgment and a broader vision. The true economics of prosperity will be seen more clearly; methods of increasing production will no longer seem antagonistic to its best interest; more work instead of less work per man will be its slogan. In that direction lies our hope.

Mexico Again

The alarums and excursions on the border, accompanied by the cheap melodrama of sundry aviators and their rescuers, have again thrown the searchlight of publicity upon the misgovernment of our southern neighbor. It is announced that a Mr. Wallen, photographer for Hearst's International Film Service, took 800 feet of motion-pictures; so the latest military expedition has not been unfruitful. The more significant event, however, is the statement issued by Señor Carranza in an interview published in the 'Nation' on August 20, at the very moment when a punitive expedition was hot on the trail of the Candelaria bandits and international relations were in danger of violent rupture. The head of the Mexican government announced: "Our relations with the United States are better each day. Having passed through the period of the War, the American people are now convinced that we remained actually neutral during an epoch when it would have been to Mexico's advantage to enter the world war." Such a lack of humor verges on criminality; Don Venustiano had better refrain from giving expression to the sentiments of the American people and confine himself to enunciating the views of his own clique in his own distressful country. If he had been fool enough to take part in the War, by giving active assistance to Germany, the result would have been slightly disadvantageous to Mexico—indeed Señor Carranza might have found himself in a position of more ease and less responsibility, either in this world or in another where the climate is *muy caliente*. In the same interview, fitly published in Mr. Oswald Villard's paper, Carranza asks for the free importation of arms from the United States into Mexico and says that an expenditure of 150,000,000 pesos would be required to maintain an army large enough to pacify the country. Presumably he expected to obtain the money, with the arms, from the United States. Whether we should lend money to a gentleman that thinks we ought to be grateful to him because he did not join our enemy recently in waging war against us, is a point we leave to the Secretary of State, but as to the selling of arms to him, there can be no doubt. It is this very supplying of guns and ammunition to the Mexicans that has contributed to the prolongation of their social disorder. Not only have Carranza's so-called generals fattened themselves financially out of his treasury, but they have gone so far as to sell arms to the parties of brigands that have kept Mexico in a state of turmoil. As things are, we can never tell to what extent the arms permitted to enter Mexico today will be used against us tomorrow. It is quite evident that Car-

ranza, from our point of view, is utterly untrustworthy, for his pluming himself on not having taken active part with the Germans against us during the War is a fair sample of his way of thinking. He is a tricky adventurer in the hands of an unscrupulous gang of half-military half-brigand half-breeds utterly unable to consolidate whatever patriotic sentiment may survive in Mexico. The most promising news that has come from across the Rio Grande recently is the anxiety shown by the newspapers of Mexico City and the protestations of loyalty to their Government offered by various associations of railway workers. Moreover it is announced that two political organizations of some importance, the Unionist Political Association and the Liberal Alliance, "have united to bring about peace in Mexico" and have called a meeting a month hence "to discuss means of getting Mexican leaders of all factions to join in an effort to stop revolutions and restore order in Mexico." Representatives of a number of the warring factions are willing to concede an armistice and it is hoped that the Carranza faction, now in control of the Government, will join in this non-partisan movement. We hope most sincerely that it may achieve its alleged purpose and that the Mexican leaders, good and bad, will summon sufficient patriotism to set aside both rancor and greed to the end that their unhappy country may put itself in order before its neighbor, in self-defence, is compelled to intervene. The Administration at Washington represents the best public opinion in the United States in its unwillingness to interfere with Mexico's domestic affairs; even those owning mining property in Mexico and anxious to resume their productive activities are willing to give the Mexicans every chance to settle their own troubles; but it is as certain as anything can be that if the Mexicans continue to fight and rob each other promiscuously, with haphazard scattering of bullets among our peaceful people near the border and with an occasional raid across the line, there will come a time when patience will cease to be a virtue, if that time has not come already. Even the most liberal man, unwilling to consent to the exercise of force against a neighboring country distracted by interminable revolution, will find just reason for ending the reign of anarchy and bloodshed. Elsewhere in this issue we publish a letter from an American mining engineer, Mr. Blamey Stevens, who knows Mexico well and likes both the country and its people. He is of the opinion that international European interference is inevitable unless American intervention anticipates such an event. He emphasizes the fact, continually overlooked, that 80% of the Mexicans are Indians, unfitted by lack of education to give effect to the ideas of representative government. Before they can be educated, they must be able to live in peace. To let them lead a cat and dog life to the end of the chapter is no kindness. As the Monroe doctrine precludes European interference, it renders us responsible for the good behavior, internationally, of our southern neighbor. The Mexican problem must be faced manfully; "watchful waiting" has failed.

The Mexican Problem

The Editor:

Sir—Very often, the clear statement of a problem is the equivalent of its solution. The clear statement of the Mexican problem has been difficult to obtain because there are so few people who know the conditions and who are at the same time disinterested enough to draw a perspective view of it.

Ever since 1910, when the present revolution began, Americans interested financially in Mexico have advocated the intervention of the United States. Within the United States, however, a certain element has been opposed to such intervention. President Wilson, by reason of his position of responsibility, has been about the only one who has been forced to try to define the sentiment that this element has felt. He says, "Mexico must no doubt struggle through long processes of blood and terror before she finds herself and returns to the paths of peace and order; but other nations, older in political experience than she, have staggered and struggled through these dark ways for years together to find themselves at last, to come out into the light, to know the price of liberty, to realize the compulsion of peace and the orderly processes of law."^{*}

In other words, the President as a historian is led to believe that the best solution of the problem is the historical one of "blood and terror". Such a thought can hardly be held without repugnance by entirely disinterested Americans. These may remember that their own country for the most part has been built up on modern and not on historical lines. The old way to stop an epidemic was to let it run its course, the new way is by hygiene and sanitation. These people may ask themselves if there is no such modern way to treat revolutionary epidemics; revolutions having no ideals or even continuity of policy. They may well imagine that there may be some way corresponding to the raising of a child, by restraint and by education; the same way in which each generation of Americans learns good citizenship.

The Mexicans, as a people, have no clear perception of their own destiny, but they are agreed that they wish to preserve their nationality in its entirety. As a consequence they are extremely suspicious of the intentions of the American people. They think always of the alienation of the immense rich territory that now constitutes the States ranging from Texas to California.

^{*}"The Mexican Question", by Woodrow Wilson, 'Ladies Home Journal', October 1916.

They think of the Panama Canal Zone and they are haunted with the nightly coyote—the call of the American jingoes—"Rio Grande to Panama"—and by these thoughts and threats of mailed fist policies are generated rancor and hatred.

It is, therefore, hardly possible that the Mexicans should welcome the suggestion of American intervention. As to President Wilson's plan, they are equally suspicious; for they see that, whether or no the policy is intended as such, it is simply a way of allowing Mexico to become weaker and more involved, so that when the Administration of the United States falls into aggressive hands Mexico will be partly or wholly absorbed. Moreover, the Mexicans realize that as time passes the western United States will become more and more crowded and that this will be the strongest argument for further American territorial expansion, especially as the northern part of Mexico would become largely inhabited by Americans and their descendants, who would desire the country to be taken into the American Union.

What would probably appeal to most Mexicans as the best solution of the problem affecting their country would be an international European intervention, instead of an American one. The more authoritative character of such an invasion of their sovereignty would take from it most, or all, of the stigma. Mexicans see that, as between such nations, there would be jealousy regarding territorial concessions or authority in Mexico, and that this would have the effect of preserving the sovereignty of their country. Many of the individuals taking part in such intervention would finally make their home in Mexico, assimilating with its population. All thinking Mexicans are in favor of European migration to their country, believing this to be its only solution, but with a revolution, or while revolution is possible, any general immigration cannot be expected.

European intervention is prohibited by that policy of the United States known as the Monroe doctrine. It is hard to conceive precisely what thought the statesmen of the United States have regarding the ultimate policy of their country, and it would be idle of them to publicly express such thought, but it is to be presumed that they foresee that the pressure of population of their country will ultimately cause the expansion of its people and industries over greater areas than they at present occupy. The Mexican and other Latin-American nations can only suppose that for this reason the Monroe doctrine does not in any way limit the actions of the United States and their people on the American continent.

In spite of this negative factor in the Monroe doctrine, which makes the other American republics so suspicious of it, the United States government has generally been considerate of the rights of other peoples, and I believe that on similar lines it might, without in any way modifying the terms of the so-called Monroe doctrine, give Mexico the temporary advantage that she would receive from a joint intervention of European powers.

The working out of this general objective might be accomplished in a number of ways and the following is merely given as an illustration:

(1) The consideration of the problem by the League of Nations, hearing all the evidence and recommendations of Mexicans, Americans, and others called.

(2) The issue of orders by the League of Nations, to the United States, to intervene in Mexico for a stated limited purpose, advising Mexico of this order.

(3) Formal advice of the American government to Mexico, with invitations to co-operate and assist or make suggestions as to methods to be employed.

(4) The enlistment of Mexican and European troops by the American government from those nationalities most desired by Mexico.

(5) The enlistment of a minimum number of Americans to serve as officers. These to be acquainted with the Mexican language and customs.

(6) The establishment of a Mexican government composed of Mexicans accepting the authority of the League of Nations, and the support of such government by the army enlisted, putting down all revolutionary and bandit elements.

(7) The setting on foot by the Mexican government of colonization plans for the personnel of the army enlisted, retaining them as a national militia, and as a local police against bandits.

Since Europeans belonging to countries of much more power and prestige than Mexico have invited foreign intervention into the affairs of their country, it is hardly to be imagined that thinking Mexicans would not give their consent to the above plan if it were favored by the League of Nations.

One of the principal troubles in the past has been the narrow provincial ideas prevailing in the United States and an entire lack of acknowledgment of the proper virtues of the Mexican people or of recognition of the weaknesses of the American. For example, the Mexican people may much more quickly attain to the mechanical, sanitary, and hygienic perfections now possessed by the United States than the inhabitants of the latter country can attain the more basic fundamentals of good manners and taste, or the musical and artistic appreciation that the Mexican people almost universally possess. Nor may it be impossible that the Mexican people will ultimately arrive at that highest and rarest attainment of civilization, an efficient government.

For these purposes, however, Mexico needs European immigration, not to transplant the present race, but to introduce those faculties of initiative and enterprise which the indigenous element lacks. Fully 80% of the

Mexican people are Indians who formerly belonged to semi-agricultural tribes; people of characteristics distinct from those of the United States Indians. When educated the Mexican Indians are philosophical and stable in character, contrasting sharply with the temperamental Latins, who form the minority element. The Indians are not necessarily inferior to the Latins, as the latter recognize, there being no remnant of race prejudice.

That the Indians are capable of high standards of civilization under a monarchy is well proved by their history. When the United States established a republic on the American continent, discontent with the old system was initiated in Mexico, and the people, ignorantly undertaking a similar change, have ever since been in an unstable condition of self-control.

Although, in its effect, this condition is base and sickening, its cause is an innocent one. It is due to the ignorance of the mass of the people; the same reason might be given for the Russian, or any other wholly internal chronic revolution. One often hears the half-blood element blamed, but it can hardly be doubted that if the same ignorant 80% of the population existed in the United States the obvious opportunity for over-ambitious spirits among the other 20% would assert itself to an even greater extent than in Mexico.

The whole revolution therefore resolves itself, like most other evils, into a condition for which no particular person or class can be blamed, and such a condition should cause no hatred or prejudice on the part of other nations. Furthermore, it is a fact that only a very small percentage of the people is engaged in revolt and banditry.

While there is a good excuse, however, it is not to be presumed that a corrective must not be sought. I mean rather to imply that the corrective must be based on fair and rational grounds, and not forced with wrath and violence. If, as I have stated, the cause of the trouble is the ignorance of the great mass of the people, it is evident that the cure is not to let these people continue to destroy themselves "with blood and terror", but to take steps to get them educated. And the first step in this direction is to end the revolution. After that a system of education must be planned along the lines suited to the best ideals and customs of Mexican national life, not the ready-made system of the United States or of any other country.

BLAMEY STEVENS.

El Paso, August 1.

IN connection with the British government's oil-developing scheme, drilling has continued uninterruptedly for a number of months, and oil has been struck at Hardstoft, Derbyshire, one of the areas being tested by Messrs. Pearson for the Ministry of Munitions. The oil is of light gravity and of good quality. The oil-bearing rock has been penetrated only a few inches. Although it is impossible at present to form any definite conclusion as to whether oil exists in paying quantities, the men in charge express themselves as satisfied with the prospects.

FIG. 1. THE DUMPS OF THE SWEENEY MILL AT KELLOGG, IDAHO

Treatment of Tailing and Ore in the Sweeny Mill

By R. S. HANDY

The Sweeny mill near Kellogg, Idaho, formerly belonged to the Federal Mining & Smelting Co. and was used by it to treat ore from the Last Chance mine at Wardner. Following the operation of this mill there remains a dump containing about 1,200,000 tons of tailing assaying 1.89% lead and 0.73 oz. silver per ton, representing 22,194 tons of lead and 865,000 oz. of silver. The deposit is nearly 70 ft. deep at the apex and covers about 20 acres of river-bottom.

During the period of 18 years in which the mill was in operation four successive layers of tailing were deposited, as shown in Fig. 1. Dump No. 1 was the earliest and smallest deposit, and the succeeding layers increased in size but decreased in lead and silver contents.

When, in July 1918, the properties of the Federal company at Wardner and Kellogg reverted to the Bunker Hill company on account of the exhaustion of the Last Chance orebodies, the commercial possibility of using the Sweeny mill for re-treating tailing from this dump was investigated. The only other material available for the mill was small lots of ore from leases in the old Last Chance workings.

The tonnage in the dump was estimated by running lines at intervals of 250 ft. at right angles to the railway-track along the foot of the dump and making cross-sections on vertical planes following these lines, as shown in Fig. 2. From intersections of the surface planes of the several layers with these vertical planes, the cubic

content and tonnage of each layer of tailing was calculated. The material weighs 110 lb. per cubic foot.

Owing to the depth of the deposit and the nature of the material composing it, an average sample of the whole dump could not be taken, but it was possible to get good samples of the various layers where they were exposed and could be identified. The sampling was done in this way, principally in open-cuts, but in a few favorable places shallow shafts were sunk for sampling purposes, as shown in Fig. 2. The average assay of the whole dump was derived from the tonnage-assay of the several layers. Decrease of richness as milling methods improved is clearly shown by the sampling, the first dump assaying 2.35% lead and 1.00 oz. silver per ton, whereas the last layer assays but 1.50% lead and 0.5 oz. silver per ton.

Laboratory tests were made on a composite sample representing the whole dump. The material was screened and sorted by hand into the products shown in Table 1. No attempt was made to sort the material below 20-mesh, the assumption being, from former experience, that about 60% of the lead and silver in this material could be saved on tables and by flotation. The tests indicated that 85% of the total material was of a size suitable for jigging, containing 81% of the total lead and 72% of the total silver. About 76% of the lead and silver contained in this portion of the sample was extracted in a product called 'jig-middling', assaying 4.28% lead and 1.5 oz.

an idle steam-shovel at the plant, however, and the arrangement of the railway tracks suggested this as a temporary means of feeding the mill. The shovel was placed in the pit abandoned by the railway company and arrangements were made for transporting the tailing to the mill at a fixed price per car-load. Mechanical troubles with the shovel and transportation difficulties made this method expensive and unsatisfactory, therefore the conveyor as originally planned is now being built.

The re-modeled mill was started in December 1918 and has been operated since on a basis of two 8-hour shifts per day. No real difficulties have been encountered other than those due to excavating and transporting the mill-feed, but these have naturally affected the mill effi-

ciency unfavorably. It is expected that the conveyor will solve most of these difficulties.

The grade of the product and the lead extraction have been practically the same as in the test, but the silver extraction is now slightly higher than that of the lead. Operating costs are shown below in cents per ton of mill-feed, based on 166 tons per 8-hour shift.

When running at full capacity for 24 hours per day, with the cost of excavating and conveying the tailing reduced to a few cents per ton by the use of a conveyor, the estimated cost of 25c. per ton will be achieved.

Ore from the leases in the old Last Chance mine-workings comes to the mill in small lots aggregating from 50 to 400 tons per month per lease. The mill is now receiving ore from eight leases, and as storage consists of four bins of 150 tons each, frequent runs must be made on this ore in order to provide separate storage for each lease.

The Bunker Hill company does not buy the ore, it acts only as a milling agent, and after deducting royalty and milling charges, turns the proceeds of milling over to the lessees. The equitable distribution of these proceeds presents an interesting problem. It would naturally be supposed that bins could be provided for storing the concentrate belonging to each lease, so that the concentrate may be shipped and settled for accordingly. This method is impracticable because the flotation concentrate cannot be successfully settled with jig concentrates on account of the large volume of water required to carry them. Also, the large circulating load in the Dorr thickeners feeding the flotation plant precludes any sharp division in the pulp from lots fed to the main mill. Furthermore, the jig-beds, sumps, and launders contain a large quantity of lead in material that is constantly shifting, so that it could not be identified as belonging to any particular lot. The only solution of the matter was to combine the concentrates from the treatment of all of the lease ore and to depend upon automatic samples of feed, concentrate, and tailing of each lot of lease ore to determine the distribution of the final proceeds. This method involves considerable mathematics, but has solved the problem satisfactorily. The application of this method to actual conditions is given below.

Each lot of lease ore is weighed and is sampled automatically as it passes through the mill. The tonnage of feed to the flotation plant, being uniform, is determined by time samples, and all the flotation products are sampled in addition to the jig and table products on account of the separate disposal of the concentrates from the two systems. The well-known formula $\frac{(F-T)}{F(C-T)}$, where C is the assay of the concentrate, F the assay of the feed, and T the assay of the tailing, is used for establishing the extraction of the metals. The metal contents of the feed and the extraction being known, the weight and contents of the other products may be calculated as shown in Fig. 5, where the formula for finding the results in each column is given at the head of the column. These data are summarized and the percentage of the total lead and

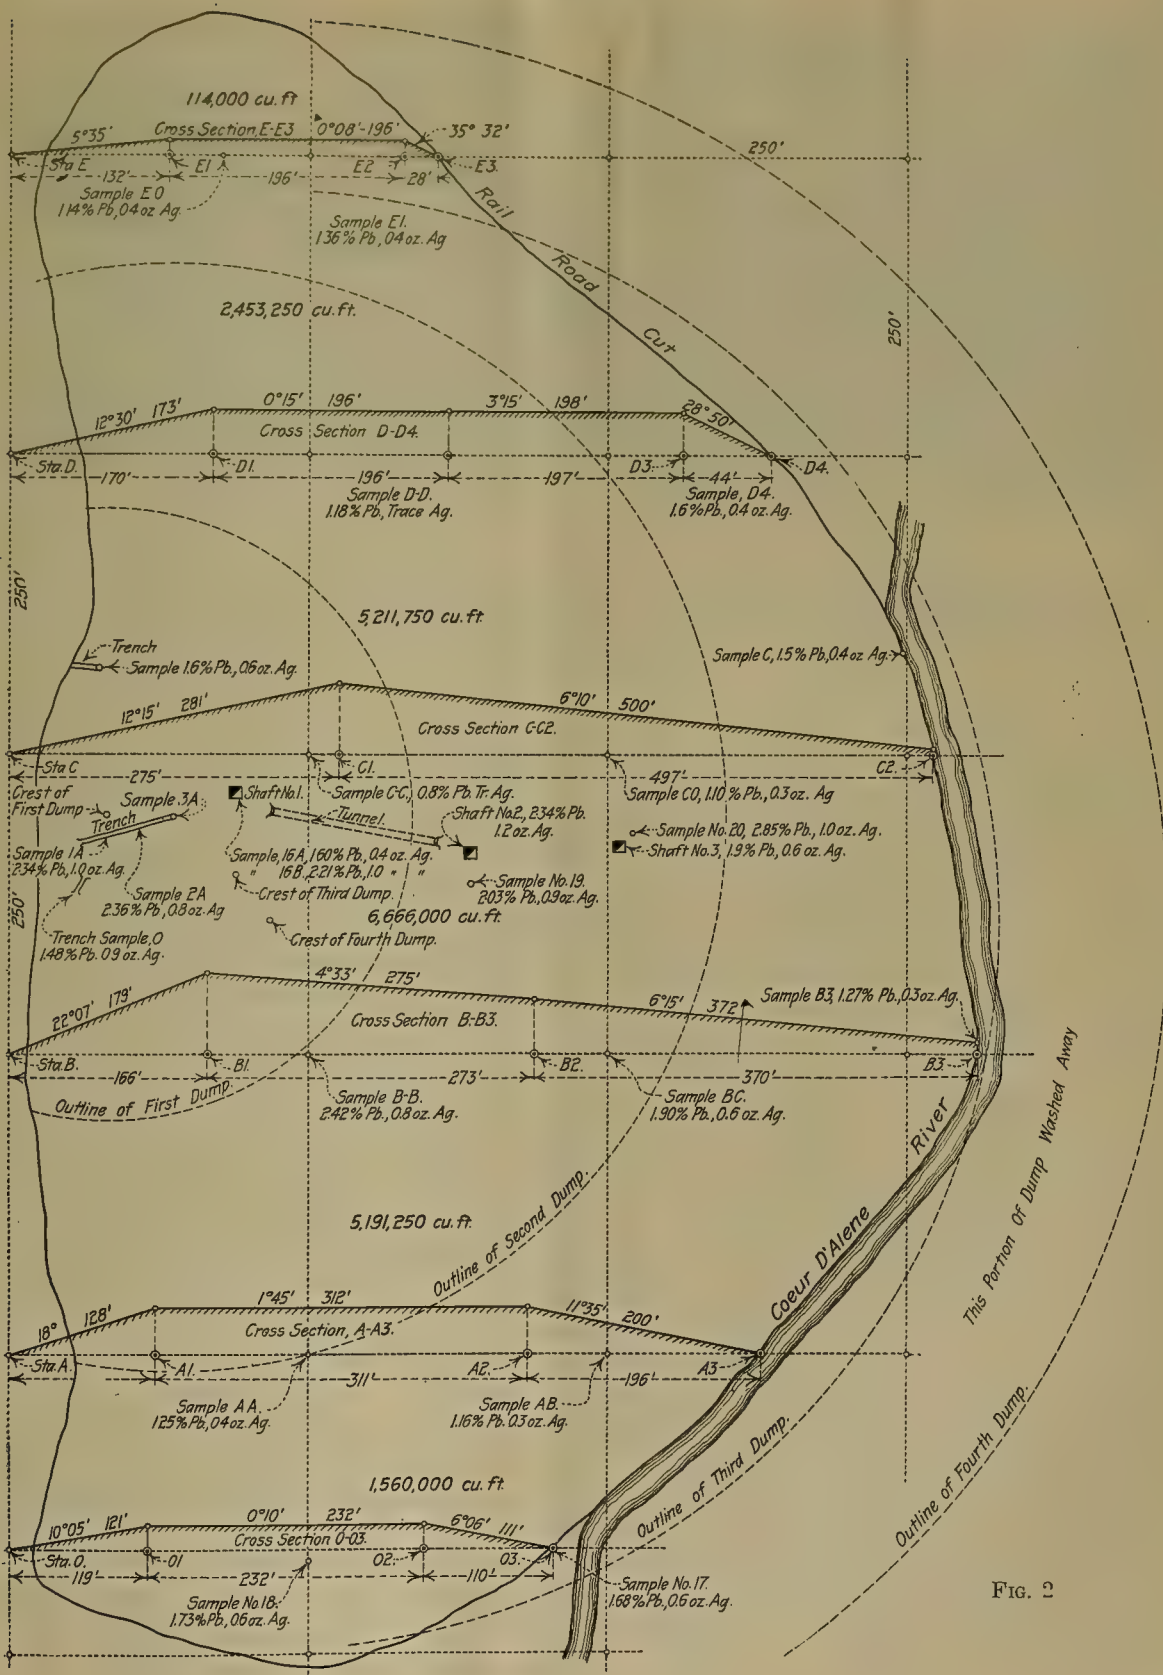

FIG. 2

of the total silver extracted for each lease is determined. Each of these percentages is multiplied by the net smelter-value of all of the lease concentrates, giving a lead factor and a silver factor, which are added together and called factor A. The sum of all factors A gives factor B, from which, related to the factors A, the percentage of the total net smelter-value for each lease may be determined. This is all clearly shown on a copy of a settlement sheet, in Fig. 6.

It is gratifying to find that the smelter returns check closely with the calculated contents of the lease concentrates. In April the proceeds of milling the lease ore as calculated by use of the formula above was 70.98 tons of concentrate assaying 43.8% lead and 15.2 oz. silver per ton, containing 31,098 tons of lead and 1082.78 oz. of silver. The actual smelter returns gave 72.18 tons of concentrates assaying 45% lead and 15.0 oz. silver per ton, containing 32,481 tons of lead and 1082.70 oz. of silver.

Manganese Production Decreasing

Reports sent by operators of manganese mines to the U. S. Geological Survey, covering the first three months of 1919, show that the shipments of manganese ore during that quarter were much smaller than during any other quarter since 1917. The shipments of high-grade ore were 23,937 tons, against 75,465 tons during the last quarter of 1918 and 305,869 tons during the entire year. The number of shippers was only 24, against 247 during the year 1918. The shipments of low-grade ore, containing 10 to 35% manganese, were 35,516 tons, against 320,455 tons during the last quarter of 1918 and 916,163 tons during the year. The extraordinary decrease in shipments is due to the unwillingness of the makers of ferro-manganese to increase further their rather large stocks of ore, which were purchased at high prices, especially as there is now only a small market for the alloy. Early in November 1918 the stocks of high-grade ore and ferro-manganese were equivalent to nearly nine months supply; the price of 50% ore ranged from \$60 to \$67 per ton, and the price of 80% ferro-manganese was \$290 per ton. In June 1919 the prices offered for 50% ore by the few furnaces that were making purchases ranged from \$25 to \$35 per ton and the price of 80% ferro-manganese ranged from \$110 to \$125 per ton. The market for ferro-manganese since January has been controlled by the surplus supply of the alloy, which is largely in the hands of steel makers, who prefer to sell their stocks and bear the loss rather than hold them longer. Practically all the ore shipped during the first quarter was material delivered on contracts made before November 11, 1918. The willingness of several large consumers of ore to continue to accept material offered under old contracts has permitted a few fortunate operators to carry on their work, but the repudiation of contracts by several companies has been a source of hardship and great loss to many operators in the United States, as well as to some in Cuba and Porto Rico. The outlook of the domestic ore industry is gloomy, and there is no reason to change an earlier estimate that the shipments for the year will probably not exceed 60,000 tons. A bill recently introduced in Congress provides for a tariff on manganese ore of 35c. per unit of manganese, or \$17.50 per ton for 50% ore, and a tariff on ferro-manganese and spiegeleisen of 75c. per unit of manganese, or \$60 per ton for 80% ferro-manganese.

FINCH QUARRY OF THE NORTHWEST MAGNESITE CO., NEAR CHEWELAH, WASHINGTON

The Magnesite Industry in the United States

By W. C. PHALEN

INTRODUCTION. *Magnesite is one of the non-metallic minerals. The importance of many of the non-metallic minerals is usually lost sight of, not only among the general public, but among the mining fraternity as well, for the reason that little glamor surrounds such substances as magnesite, mica, or asbestos, the rôle of which perhaps may be considered a humble one in the industrial world, even though a necessary one. It is a fact, however, that non-metallic minerals and products, in general, touch our daily life very closely and on a scale the index of which is furnished by the following figures:

The total value of the non-metallic minerals and products made from them in 1917 exceeded the value of metallic minerals or products by \$797,098,445. In 1916 this excess in value amounted to \$257,955,497. Of all the mineral commodities produced in the United States in 1917, the first ten arranged in value of output were as follows: coal, pig-iron, petroleum, copper, clay-products, natural gas, cement, zinc, lead, and ferro-alloys. The list itself is the same as for 1916, except that in the latter year gold is included instead of ferro-alloys. The order for 1916 is slightly different and was as follows: coal, pig-iron, copper, petroleum, clay-products, zinc, natural gas, cement, gold, and lead. It will be observed, therefore, that five of the commodities were metallic and five belong in the non-metallic class for each year. The total value of metallic and non-metallic products is listed below.

Table Showing Value of Metallic and Non-Metallic Products†

| | 1916 | 1917 |
|--|-----------------|-----------------|
| Non-metallic products | \$1,878,463,681 | \$2,888,923,007 |
| Metallic products | 1,620,508,184 | 2,091,824,562 |
| Excess in value of non-metallic products.. | \$257,955,497 | \$797,098,445 |

†Figures from U. S. Geological Survey, Division of Mineral Resources.

DEVELOPMENT OF THE INDUSTRY. Magnesite may be considered a war mineral. It was a war mineral in the sense that prior to the War our supply to the extent of 96 to 97% was imported, chiefly from Austria. Our small domestic production of 3 to 4% came entirely from California. During 1917, after a fair recovery from the slump which the industry experienced in 1915 as a result of the cessation of imports and before domestic production had gained much headway, importations amounted to only 11% of the total quantity consumed, and of this 11% a portion, which was high in lime, came from Canada.

From a pre-war output of about 10,000 tons reckoned as 'crude', production in California increased to 211,000 tons in 1917, but fell back to 90,000 tons in 1918. Production in the State of Washington began in December 1916 with an output of 715 tons, increasing to 105,000 tons in 1917 and approximately 130,000 tons in 1918. Thus the history of the magnesite industry shows an almost complete reversal from a foreign to a domestic status during the brief space of five years.

ORE DEPOSITS. Magnesite is widely distributed in California, occurring in the Coast range and along the west slope of the Sierra Nevada. Deposits are known to extend from Mendocino county on the north to Riverside county on the south—a distance of 500 miles. The Coast range counties in which it is known to occur are Alameda, Mendocino, Napa, San Benito, Santa Clara, Sonoma, and Stanislaus; it is also found in Fresno, Kern, Placer, Riverside, Tulare, and Tuolumne—13 counties in

*Published with permission of the Director of the U. S. Bureau of Mines. The writer is Mineral Technologist to the Bureau.

all. The most important deposits are found in Tulare, Santa Clara, Napa, and San Benito counties.

The greater part of the magnesite in California occurs in the form of veins or lenses of variable length and thickness in massive serpentine. Some of the magnesite masses are as much as 30 ft. in thickness and from this thickness they range to mere stringers and gash veins too thin to work. The Californian magnesite is of the amorphous type.

In Washington, the mineral is crystalline and occurs as massive beds in a sedimentary series in which are found dolomite, shale, and quartzite into which basic igneous rocks have been intruded. The only known deposits are within a radius of 5 to 12 miles south-west of the town of Chewelah, in Stevens county, or about 60 miles north of Spokane.

METHODS OF MINING. In Washington regular quarrying methods are employed in getting out the ore. Tunnels are run into the hill at convenient points and raises are put up to the quarry-floor. The ore is allowed to fall through such raises into small cars that are trammed by hand to the surface. In California, where the veins are often thick and steeply dipping, various mining methods are employed, depending on the thickness and attitude of the veins. Glory-holes are dug where the masses are very thick, but overhand stoping with back-filling to prevent caving is the usual method.

The mines are usually some distance from the calcining-plants, so aerial trams are employed to carry the ore to them. An elaborate system of gravity plains and chutes is used at the mine of the Tulare Mining Co. near Porterville. In this method empty cars are hauled back by horses.

METHODS OF CALCINING THE ORE. Magnesite by weight consists of 47.6% magnesia and 52.4% carbon di-oxide. Calcination, therefore, saves freight. Soon after the War started, nearly every important mine in the West established a calcining-plant where at least a preliminary burning was carried out. As time went on, methods employed were perfected and our facilities for calcination, both in method and capacity of furnaces, are now comparable with those used in Austria before the War.

Calcination is effected in different types of kilns: (1) bottle-shaped kilns; (2) vertical kilns resembling lime-kilns; and (3) rotary kilns, like those used in the manufacture of cement. Distillate or crude oil is the fuel in chief use in California, but coke is employed at one plant. The distillate is sprayed with air or steam into the four different compartments of the bottle-shaped kilns and the waste-heated gases serve to heat the crude ore as it descends from the intake to the reverberatory chambers, where actual calcination takes place. Coke, where used, is mixed directly with the crude magnesite and its content of ash, therefore, has to be as low as possible. At most plants there is good economy of waste heat and action is practically continuous in all the different types of kilns.

At the up-to-date plant of the Northwest Magnesite

Co. at Chewelah, Washington, five rotary kilns are installed and a sixth is on the ground ready to be set up. Powdered coke is the fuel used and the capacity is 60 to 65 tons of dead-burned magnesite per kiln per 24 hours, making a total of 325 tons per day or approximately 10,000 tons per month. When the sixth kiln is installed this will be increased to 12,000 tons per month. The American Mineral Production Co., operating near Chewelah, has shipped its material recently to the plant of the International Portland Cement Co. near Spokane, where it is dead-burned in 165-ft. rotary kilns. In general, it may be said that American practice is comparable with foreign practice so far as rotary kilns are concerned. Action in rotary kilns is continuous.

Capacity of kilns varies according to the different types. The usual practice in the bottle-shaped kilns gives 15 to 20 tons of calcine per 24 hours; in 125-ft. rotary kilns, 60 to 75 tons per 24 hours; and in the vertical kilns, 7 tons per 24 hours. In the bottle-shaped kilns only coarse lump magnesite can be calcined; the fine cannot be used for the reason that it obstructs the draft. In rotary kilns all sizes may be calcined, fine as well as lump.

Calcination yields two products. If the burning is carried to the point where 3 to 4% of carbon di-oxide is left, the product is referred to as 'caustic' and is consumed principally in the flooring trade. Greek magnesite was extensively used in flooring cement prior to the War and Californian magnesite is now being used in part for this purpose. If dead-burned, namely, to the point where it contains only $\frac{1}{2}$ % of carbon di-oxide by weight, it is referred to as dead-burned; and approximately 90% of the total consumption of the United States is of this kind.

The calcining capacity of the Californian plants is estimated at 10,000 tons per month. In Washington, considering one plant alone, there is a calcining capacity of 10,000 tons per month, making the present available capacity of the country in excess of 20,000 tons per month, or 240,000 tons per year, which is more than ample for our present requirements.

THE RESERVES of magnesite in Washington are of much greater magnitude than those of California. If the annual consumption of raw magnesite in the United States be taken as 350,000 tons, our domestic supply will easily last at least a generation and there is always the possibility of the discovery of new deposits. No deposits are pure, and magnesite for the trade has to be selected with care, but in this respect domestic deposits are no different from the more important foreign sources.

THE USES of magnesite are restricted. Its main use is as a refractory in lining open-hearth steel-furnaces; but a comparatively small quantity is consumed per ton of steel manufactured. The total world production has been estimated to be between 400,000 and 500,000 tons yearly. The United States is the main consumer, its consumption being estimated at three-fourths of the world output. The total value, at the mines, of the

CALCINING PLANT OF THE TULARE MINING CO.

VERTICAL KILNS OF THE AMERICAN MINERAL PRODUCTION CO.

crude material of domestic production did not exceed \$3,000,000 in 1917, but on the calcined basis the value of the product was approximately \$8,000,000.

Some magnesite is used for medicinal and chemical purposes. Californian magnesite has been used in making sulphite paper-pulp, but this use is now negligible, the magnesite having been replaced largely by dolomite for this purpose on the Pacific Coast. Magnesite has also been used as a source of carbon di-oxide gas, making use of the resultant caustic product; also in fire-resisting magnesia paints and as a non-conducting material for boiler and pipe coverings. A larger quantity is used in making flooring cement. The main use of magnesite is as a refractory for lining open-hearth steel furnaces and in lead, copper, and electric, or other heating, melting, and welding furnaces. It is estimated that 90% is consumed for use in these refractories.

The mineral is used in two forms: crude and calcined. Calcination results in two products, depending upon the intensity of the burning. One product is the 'dead-burned' magnesite used in grain form for furnace-linings or manufactured into magnesite brick, which is also used in lining furnaces. The other calcined product, known as caustic magnesite, has not been burned quite so much and contains 3 to 4% carbon di-oxide, whereas the dead-burned does not carry more than $\frac{1}{2}$ of 1%. Caustic magnesite is mixed with various ingredi-

ents such as wood-flour, cork, asbestos, silica, talc, coloring matter, and magnesium chloride to form the Sorel cement of the plastic-flooring trade. It sets quickly and produces a floor that is dustless and resilient. Common report is to the effect that it was used by the Austrians and Germans on the Western front in making gun-emplacements on account of its quick setting properties and its resilience.

Crystalline magnesite has long been considered the best material available for furnace-bottoms. It came from Austria before the War, but during the War important supplies were developed in Washington. Austrian magnesite contains such a proportion of iron oxide as to make it 'bond' or set well on furnace-bottoms, thereby forming a hearth of great density, which is subject to minimum erosion by molten steel and which is hardly affected by slag. To the Washington mineral, iron oxide has to be added in small quantity to bring this constituent up to the required standard. The silica and lime in the Washington product are higher than in the foreign, but the specifications with respect to these constituents and to iron and alumina have been well met by American producers.

The amorphous variety has been used in furnace-bot-

CALCINING PLANT OF THE PORTERVILLE MAGNESITE CO.

NORTHWEST MAGNESITE CO., NEAR CHEWELAH

toms, but has been found not so satisfactory as the crystalline for refractory purposes, owing to its high degree of purity (absence of iron, more especially), which makes it so refractory that it will not bond or fuse and thus form the dense bottoms or hearths so desirable in making steel.

Some of the Californian product contains naturally a small percentage of iron oxide and this iron-bearing magnesite was used for refractory purposes during the War; but under normal conditions neither Californian nor Greek magnesite has been used for refractory purposes to any considerable extent. The amorphous variety, which is of a dead-white color, is particularly adapted to making flooring material and for the minor miscellaneous uses to which the pure product is applied.

Before the War, between 6 and 14 pounds of magnesite was used per ton of steel, according to estimates of certain Eastern steel-makers. The quantity used was cut approximately in half during the War, owing to the scarcity and high price. These conditions in turn led to the part substitution of dead-burned dolomite for dead-burned magnesite. The dolomite so used, was, as a rule, specially prepared to avoid the difficulties caused by the presence of free lime. About 3 to 7, or an average of 5, pounds of magnesite per ton of steel was consumed in 1917 and this may be considered approximately the present consumption. In other words, our magnesite consumption per unit of steel is about half of what it was during the pre-war period.

The cost of the magnesite consumed per ton of steel is small. Last spring with the price of magnesite brick (weighing 10 lb. each) at \$450 per thousand and with grain magnesite at Chester, Pennsylvania, at about \$48.50 per ton, the cost of magnesite per ton of steel on the basis of half brick and half grain would not be far from 17 to 18 cents. Economy in the use of magnesite, and particularly in the use of dead-burned grain and the substitution therefor of dead-burned dolomite, have tended to offset the high war prices. Dead-burned dolomite has been used in the past as a refractory in repairing furnace-linings, but statistics showing the extent of this application are lacking. According to the U. S. Geological Survey, 340,000 tons of dead-burned dolomite was marketed in 1917, which indicates at least an important degree of competition with dead-burned grain magnesite.

TOTAL INVESTMENTS. Most of the plants where calcining is done are large and in many places there have been considerable investments. It is estimated that the total investment in California and Washington is from \$3,500,000 to \$4,000,000. The number of men employed at present in California is estimated at approximately 150 to 200. On the assumption that this is about 25% of what it was during the War, the total number of men formerly employed in this industry was 800 or 1000. The total number of men employed during the War at the different properties in Washington was probably not far from 400 or 500. Thus, it is estimated that the in-

dustry would normally employ more than 1000 men, with 1500 as a maximum. These figures include only men engaged in the actual producing and transporting end of the business.

Minerals in Ireland

From investigations which have so far been carried out it has become evident that, though the general prosperity of the mineral industry of Ireland during the early part of the nineteenth century is hardly likely to be revived, a substantial increase in the production of certain minerals could be maintained under improved conditions. Since the outbreak of the War, not only has the normal production of minerals not been maintained, but there has been in almost every case a very considerable falling off in the output. The production of non-ferrous metals in recent years has been negligible. A good deal of prospecting has been done on the Avoca group of copper mines in County Wicklow, and it is now estimated that considerable quantities of low-grade copper ore have been proved. Exploration for secondary enrichment of these mines has taken place, and it is stated that there appears to be a fair prospect of their becoming important copper producers. Tests are being made with a view to utilizing some material containing iron pyrites too low in yield of sulphur to be dealt with ordinarily. A small expenditure has been sanctioned to double the capacity of a dressing plant working upon dumps and to re-open a portion of the old workings of the Glendalough and Luganure mines in County Wicklow. A mine formerly worked for antimony in the parish of Clontibret, County Monaghan, will probably be proved shortly. Boring in Ireland has been undertaken in certain areas to determine the thickness and value of cannel coal, but as yet the investigation has not reached any conclusive stage. It is estimated that the minimum quantity of coal of good quality remaining in half a dozen Irish coalfields is 300,000,000 tons. In 1916 (latest statistics available) 15,329 tons of barium compounds was mined in Ireland, 75,240 tons of anthracite, 89,833 tons of other coal, 7 tons of copper ore, 30,678 tons of iron ore, 1 ton of lead ore, and 25,035 tons of rock salt; also about 16,000 tons of barite and witherite, in regard to which it is stated that there are many large deposits that have not yet been developed. Very little zinc ore is obtained in this country. The soapstone industry is now being worked in the north of Ireland, which produces the bulk of the output for the United Kingdom. About 583,000 tons of limestone is quarried annually and used chiefly for flux in the smelting of iron ores and in the production of cement. Little has been done during the past 20 years in the way of mining pyrite. Some 2000 tons is obtained annually from Ireland, and that amount represents a little less than a fifth of the entire output for the United Kingdom. The production of bauxite, which is the principal source of aluminum, is confined to the County of Antrim, with occasional supplies from Londonderry.

Neighborliness as an Industrial Factor

By C. E. JULIHN

*In the growing complexity of industry it is easy to become confused and to get away from clear thinking as to what is fundamental in human society. I shall try to show that there is a fundamental need for neighborliness, and that it is an industrial factor of such importance as to be worthy of earnest cultivation.

We always recognize at once the need for food, clothing, and shelter, but to get these, modern society requires certain other things which may be summed up under the heading of 'communications'. Under the conditions of American life, communications have become as truly necessary as the three original necessities. There must be railroads to transport goods from the place where they are produced to the points of consumption. There must be mails, telegraphs, and telephones for the rapid exchange of human thought. There must be newspapers and journals as instruments of a great public forum in which the ideas of a hundred million people are sifted, winnowed, and weighed. I must ask you, however, to recall that man has always been gregarious; that he has never been fitted to live alone. His desire for fellowship is deep-rooted and cognate with the need of it from the very beginning of his development. In the early history of the race, man is believed to have survived largely by this trait, which is quite familiar to us as a characteristic of the lower primates. I will therefore go so far as to express my belief that there are really five, instead of three, fundamental requirements of civilized man: they are food, clothing, shelter, communications, and fellowship.

Fellowship in former times did much of the work of modern society that I have summed up under the term 'communications'. The instinct of fellowship induced human contact, which led to barter, for one thing. By meeting others and finding out what they had, primitive man learned to replenish deficiencies in his own supplies by exchange of those things he could most readily produce in excess of his needs. The more friendly a man was, the more successful he became in such transactions. Your aboriginal tradesman learned to cultivate good fellowship as a matter of business. The bright eye, good humor, and glad hand of the modern salesman has a long history, running back no doubt to a time when canny savages bartered meat for fish, or hides and ivory for arrows and spears.

You may be sure then that those racial strains have had the best chance to survive which were characterized by a strong instinct toward good fellowship. The desire

for it has become literally a necessity of our natures, yet the effect of our rapid industrial development has been to diminish the observance of certain phases of good fellowship. It is no longer necessary for men to gossip in the barber-shop or tavern in order to learn the news. It may be gained more cheaply and more easily by the reading of newspapers. Entertainment and recreation has also been specialized in various ways and very notably in recent times by the development of the 'movies', which fill one kind of need for entertainment in even the most remote communities. Books have become an efficient instrument of education which often may be used to best advantage in solitude. The facilitation of local transportation by means of automobiles and great systems of electric railroads has further tended to reduce the necessity for intimate contact with those in our immediate vicinity. In the industries themselves, specialization of tasks has again greatly obscured the importance of fellowship. The factory worker spends no effort in getting the materials he is to fashion. They are supplied to him by others, who in turn specialize in just such work. His finished product is also carried away by men to whom he need not even say, "Good day, friend, I am glad to see you looking well."

Now I say to you that this tendency is wrong; that it must be combatted; that we must hold fast to the means of satisfying the human longing for fellowship of an intimate and personal kind. It is not only my wish to call your attention to this necessity and to ask your help in the furtherance of its gratification. I mean to tell you specifically how it can be done; but first I must say a few words upon the peculiar need of good fellowship at this particular time.

With the twentieth century has come an astounding climax in the economic development of man. By a steady crescendo of progress in science and invention, we have at last learned in a measure to really enjoy the fruits of the earth. The available supply of food, and its variety also, has been enormously increased over that existing in any previous period of man's existence. Of like order is the increase in the supply of clothing, shelter, and communications. Moreover, the children, of this country at least, are cared for in a way which was never before possible, and I thank God that a principal evidence of his blessing is a reasonable measure of equality in opportunity for all our children. There is not absolute equality of opportunity as yet, but there has been at least a splendid advance in this respect.

These are fundamental things of which I am speaking. Without them all the less fundamental things of life,

*An address delivered before the Lake Superior Safety Conference, at Duluth, on June 20, 1919

however beautiful, however alluring they may be, are difficult of attainment.

Those of you who have read much history have realized no doubt that the great cause of deprivation in the past has been the simple one that there was not enough of the necessities to go around and fully supply the population. As long as that was true, men had a vital personal incentive to entrench themselves within the ramparts of privilege, for it is necessary that the individual shall first guard his own life and that of his offspring before he has any power to extend help in a widening circle to humanity at large. Hence, I say to you that the mere learning how to produce goods rapidly and cheaply is the most important business of mankind at present. In this direction is the greatest hope for his happiness. From it we may expect the noblest flowering of spirituality and opportunity to attain the things which will make life most worth while to future generations. Yet, while these things should be so obvious, we are at this very time menaced by tendencies which threaten the whole structure of civilization.

A great nation until recently regarded as a leader of industry has suffered some strange psychological sickness, affecting its people as a whole, which has caused them to initiate a bloody war against their neighbors, leading to the wanton destruction of an enormous part of the world's wealth. We have been astounded to witness this horrible recrudescence of discarded anti-social conceptions. The world as a result of this war has suffered a shock from the destruction of wealth under which the very foundations of civilization have been shaken. Week after week during the awful cataclysm the labor required for the building of a Panama Canal has been wasted. The terrible effects of such prodigious loss will oppress us for a generation at least.

It should be obvious to all that the one way to salvation lies in the direction of reconstruction, in order that destroyed wealth may be replaced with greatest speed. Mankind cannot save itself from paying the price of this supreme folly by the devising of any new political or social formula. It can save itself by work alone. We therefore should have our minds centred only upon the great business of production, while holding tight to our well-tried institutions and leaving political experiments to a time when they can be tried more safely.

Yet in this time for work, and work only, we have become measurably infected by a plague of half-baked ideas that have come to us from sick Europe. I do not say this scornfully, for the unhappy serfs of Russia have my deepest sympathy in their groping for light. But I do say most emphatically that they are not fit to be our teachers. For two centuries our free institutions have caused our population to thrive and grow rich. We have witnessed a steady progress in the living conditions of the mass of our people, a progress that has kept pace with their increase in efficiency. This is our national balance-sheet. Its sum total is black ink, substantial and satisfying. Russia, on the other hand, has produced only talk.

She has destroyed the organization for production and has lived awhile on the accumulation of wealth resulting from honest labor in the past. Now she is starving and preparing the way for another society of slaves and masters, because that is always the issue of a society that has not enough goods for the needs of all. It is as sure as the rising of the sun in the morning, and as the orderly progress of the seasons, that in a state of general privation, the strong and able will find means to take care of themselves, to guard their own existence, while the weak will be made to contribute to this.

It is a disheartening thing to realize how few men there are who see clearly the immateriality of political formula as compared with the vital importance of an industrial formula of "work and more work, efficiency and more efficiency" in order that mankind may have more goods and better, more food and better, more leisure for study, more energy for creating human happiness. This may be called the creed of the industrialist. I for one am in this sense an 'industrialist', and I can sincerely advise you to learn the creed and join with me in its purpose. Nothing else really matters if we hold to this great principle. A wise old Senator was once asked if he was a Presbyterian, and he replied, "No, I am just a Senator, and if I happen to have a religion, that is my own private, purely personal affair." So I would like to see this country a united nation of industrialists, holding their politics and religious opinions as subordinate personal matters.

Political formulas are not nearly as important as they are generally supposed to be. The people of India, for example, are reported to be in a state of unrest as a result of demands for freedom from British control, but if you will read that admirable book, 'The Principles of Mining', by H. C. Hoover, who was our Food Administrator during the War, you will readily see that India should rather be concerning herself with the securing of industrial education. Mr. Hoover has made a comparison of results obtained in American and Indian mines of similar character, having stopping-widths of from 4 to 5 feet, similar dip to the vein and depth of working, while all mines involved in the comparison are provided with every labor-saving device available. In the Indian mines there is an average yearly production of 69 tons per man employed, while in the American mines one man produces 713 tons, or over ten times as much as his brother in India. Is there much to wonder at that the average wage of the Americans was about \$3.50 as against 20 cents for the Indians? Yet, in spite of the relatively enormous wage paid in America, the cost of its ore was only \$1.92 per ton, as against \$3.85 per ton for the Indian ore. Combining the efficiency indicated by the lower price per ton with that of ten times greater production there is indicated a total efficiency of the American labor 20 times as great as that of the Indian labor. Think of it, gentlemen! It seems almost incredible, but a similar tendency is always indicated by comparison of lower types of labor with higher. Yet the Filipinos and the Indians clamor only for political power. Let us suppose that the effi-

ciency of Indian labor could be increased from 1000% to 2000%, would it not be more important to the people of India than the gaining of a bauble of political independence? The answer is obvious; but I repeat that we have heard no clamor from India for an army of teachers from England.

Now in spite of our high average of intelligence, we also, like the Filipinos, the Indians, and the Russians, have a tendency to chase rainbows when substantial betterment is right at hand. American labor is the best paid in the world simply because it is worth the price, not because of anything connected with political privilege. It produces the goods with which it is paid. When more goods are produced more can be distributed as wages. I am assuming you all know wages are expressed in money merely for convenience, while real wages are the things the money buys. When the average hours of work, or intensity of individual effort, or efficient use of machinery is diminished, the output of goods decreases and less goods are produced for the paying of real wages. This economic law is inexorable, and cannot be affected by any legislation whatever.

Yet there is much talk at present of this and that political panacea which pretends to be a means of evading economic law, and many seem to believe that if just the right formula can be found it will produce marvelous results, like the casting out of devils from swine by incantation. Now, I say to you that there is no such thing possible. There will always be a jargon of political catchwords to which the answer is this: If you produce goods you will have them to enjoy and not otherwise.

When Russia learns how a man may lift himself by his bootstraps, she may find out how proclamations of high wages without the production of goods to back them up can be made to supply human needs, but until then we should faithfully hold to the good old system, which has fed us and clothed us and housed us better than any other people in the world. Let us then concentrate our thought on ways to increase our own production 1000%. Let us make our children as much superior to ourselves industrially as we are superior to the Indians. If we can do that we will have a millenium made of more substantial stuff than these Russian dreams, a millenium that will endure when the present dreams of Russia have sunk into the dim pages of history.

A Parable

*On a rather uncomfortable island a ship's crew—those who survived—were trying to get along after the shipwreck. They were going through the traditional stunts of salvaging and improving subsistence. Only the climate helped them.

But there were some difficulties other than physical—in fact, psychological.

On getting ashore, the survivors salvaged among other things the purser's safe. At first they felt some bitter-

ness since they could neither eat nor wear the contents. But in grim jest they agreed to portion out the said contents for use as convenient tokens in the handling of their common goods—their accumulated salvage and what they might crudely produce anew on the fertile island. Their individual needs, their individual economy, and most of their individual producing or serving capacity would determine how much they should spend, should save, should acquire, as measured by these tokens.

But soon there ensued the psychological difficulties.

A good many felt that, after so sharp an ordeal in baffling death, there should be a relaxing period, of rest and recuperation and enjoyment; a little fling—in celebration.

So they used up, not merely coins and bills, but much of their subsistence in goods that these things measured. And they recontributed but a tithe of what they consumed. Yet the aggregate volume of the salt-stained currency remained constant.

Others, again, murmured at the stress of long hours and arduous toil that the wiser among them urged. Also they clamored for more, and yet more, of the tokens in return, that they might bodily enjoy more of the pleasant but dwindling stock of goods—remaining or re-created—that these could command.

So it came to pass that these goods gradually—through having been scarce at first and then becoming scarcer—commanded ever more of the tokens daily.

Whereat there was puzzlement and then a sulking among many. They tended to grow envious or suspicious of their fellows, singly and by classes—those who had once sailed steerage against those who had sailed saloon. There arose disputes as to proper shares—in tokens, in goods, in effort, in time of effort.

Those who sulked declared, "We shall make these others see how indispensable we are. We shall sulk some more; then they will perceive how inflexible is our want, how imperative our will. We shall consume while we have tokens left; mayhap we shall resort to some sort of force; but we shall do nothing, and save nothing."

So the volume of life-sustaining goods—remaining and renewed—dwindled steadily. But the total of salt-stained coins and bills stayed constant; and the latter fetched ever less of the former.

Whereupon, after deep cogitation, some said, "Let us cast into the sea one-half of these tokens. Then shall our present shares of goods be instantly doubled."

Now the soil of the island was fertile, and its climate mild. But what these two things might mean was neglected, while many disputed and many more sulked, according to their class.

And the goods of all—remaining or renewed—dwindled yet more. And the power of each token shrank.

All of which was due to a strong fear—that finally strewed the island with white bones.

The fear of famine?

Nay, a jealous fear of Work, and of Abstinence!

The storm, that wrecked the ship, was War.

The island—among millions of planets—is the World.

*From the 'Boston News Bureau' of August 13.

A Monkey-Proof Crusher

The following correspondence explains itself. The first letter was addressed to the Editor, but he, feeling his incompetence, handed it to the Business Manager. The sketches in the reply from Nigeria are reproduced in fac simile, except that in the original they appear in purple ink, which heightens their effectiveness.

Jos, Northern Nigeria,
via Lagos, West Coast, Africa.

24 Jan., 1919.

The Editor:

Sir—In regard to a hand-power quartz-crusher for prospecting, please recommend me something, and, if possible, induce the makers to send me illustrated catalogues. Either U. S. A. or U. K. make. Fit for niggers, i. e., monkey-proof. 'Panklast' lever business, as used in Coolgardie, W. A., in the early days, might do. Tell me, if you will, who makes it and where.

Thanking you in anticipation,

Yours faithfully,

R. W. HANNAM.

Mr. R. W. Hannam,

Jos, Northern Nigeria,

Via Lagos, West Coast, Africa.

March 20, 1919.

Dear Sir:

We are completely puzzled to know just how to help you. You give practically no particulars outside of the

fact, as we make out, that you want some sort of a hand-power mill for crushing quartz. We never heard of the 'Panklast', so even that clue was insufficient to give us any line to work on. The nearest to a hand-power mill is a good old-fashioned 16-pound sledge-hammer. Next to that is a single-jack. Next to that is a mortar and pestle, in which the pestle is arranged with a

FIG. 1

spring-board to help out on the return stroke. The only other suggestion that we could offer would be a small hand-operated rock-crusher, and an equally small hand-operated grinder, as are sometimes used in large assay-offices for crushing and grinding samples. Of course, the use of the word 'tonnage' in connection with such small apparatus is a misnomer. Poundage is better, and even so, if you attempt to work continuously you would probably use up your stock of niggers quite rapidly.

We are glad to have an opportunity of serving you and hope that the information thus elicited will prove to be of benefit.

Yours very truly,

MINING AND SCIENTIFIC PRESS.

C. T. HUTCHINSON,

Manager.

Naraguta, Northern Nigeria,
via Lagos, West Africa.

3 May, 1919.

The Manager,

Mining & Scientific Press,

California, U. S.

Dear Sir,

Thank you for your reply dated 20 March last to my

FIG. 2

Front elevation

X section

FIG. 3

query for a HAND-POWER QUARTZ CRUSHER and the interest you have taken in the matter.

We have used the 'spring-dolly' (your pestle and mortar with spring-board). Our board was a sapling (see marginal note, Fig. 1). Three of them, more or less, in a row. No good. Too slow.

My idea was a couple of gravity stamps, lifted in the ordinary way by a cam, but by hand-power. See above, Fig. 2 and Fig. 3.

Transport is our trouble, and anyway no machine is nigger-proof. There are lots of niggers, and that's our strong point.

Should you hear of anyone manufacturing a hand or treadle mill, would you please let me know.

Yours faithfully,

R. W. HANNAM.

The Cockle Creek Smelting Plant

By GUY COURTNEY

*The Sulphide Corporation's smelting equipment consists of three blast-furnaces, supplied with blast from two sets of vertical-piston blowers, each capable of delivering 8000 cu. ft. of air per minute at a pressure of 60 oz. per square inch. Each blower is belt-driven by a 130-hp. motor. The maximum speed of the blowing-engine is 35 revolutions per minute.

No. 1, the largest of the three blast-furnaces, has a crucible-area of 49.5 sq. ft., and measures 11 ft. 6 in. by 5 ft. at the tuyeres. From tapping-floor to feed-floor is 35 ft. 9 in., and this space holds, when full, 100 tons of charge. Blast enters through thirteen 3-in. tuyeres at 60-oz. pressure. Working normally, this furnace is capable of treating 300 tons of charge, exclusive of returned slag and coke, per 24 hours, with an output of 100 tons of lead. Tapped slag flows into a C. I. fore-hearth mounted on wheels, where any lead and matte are caught, and the slag overflows into a three-ton cast-iron pot, in which it is drawn away by an electric locomotive and poured over the dump.

Fore-hearths are replaced several times in a shift, the full ones being taken to the matte-shed, where they are drained of matte and lead, and the shells knocked out. Any slag tapped out of these fore-hearths, together with the shell, is returned to the blast-furnace.

No. 2 blast-furnace measures 8 ft. 2 in. by 4 ft. 4 in. at the tuyeres; it has a crucible area of 29.3 sq. ft., and is 34 ft. high from tapping-floor to feed-box. Blast is delivered through nine 3-in. tuyeres at 55-oz. pressure. This furnace has a capacity of 250 tons of charge in 24 hours. The fore-hearth is similar to that already mentioned.

No. 3 blast-furnace measures 5 ft. 6 in. by 2 ft. 9 in. at the tuyeres, and has a crucible-area of 15 sq. ft. This furnace is chiefly used for smelting drosses and anti-monial slags from the refinery.

In all cases the slag is taken out to the dump in the same type of slag-pot, and by the same means of locomotion. The charging arrangements consist of a series of bins, six in number, situated conveniently at the back of No. 1 furnace, and connected with all three furnaces by a 2-ft. gauge tramway system.

Two jaw-breakers reduce all materials to about 4-in. screen, and feed two bucket-elevators, which lift the fluxes and ores to the bin top, and deliver by means of movable chutes into any required bin. When full, there is enough material to last the large furnace for about 36 hours. A gang of men, working on day-shift only, keeps the bins charged. Each bin is provided with a hopper-

scale, the hopper of which is divided down the centre into two compartments, so that on opening the bin-door the material is split by the partition into two approximately equal parts, equivalent to two or four charges, according

ARRANGEMENT OF SMELTER CHARGE BINS & CHARGING HOPPERS.
COCKLE CREEK WORKS.

as to whether the total charge has been weighed out for four or eight charges. By weighing the charges in this way, the element of error is reduced to a very small figure.

Running underneath the scale hoppers is a 3-ft. track,

*Abstracted from the Proceedings of the Australasian Institute of Mining Engineers.

on which travels a special type of charge-truck, divided into four compartments by plates at right angles to one another. In order to facilitate the discharge of the fluxes, the truck is constructed on the saddle-back principle, and has a door to each of the four compartments. It is, therefore, possible to wheel four charges at once, and to discharge them independently of one another. From the flux truck the charge goes into a set of four tilting hoppers, built to the level of the floor, and over a pit in which is the truck for hauling the complete charge to the top of the furnace. These hoppers are tilted by means of hydraulic rams operated by control-levers.

The flux line runs down the centre of the hoppers, while the Huntington-Heberlein product is brought to either side and crosses at right-angles to the flux line. The H. H. mixture, which constitutes three-quarters of the full charge, is hauled from the H. H. pot-house by electric locomotives. A rake of 10 trucks, equivalent to ten charges, is brought up and run over a weighbridge, where the weight is adjusted. It is then taken on to the charge-making floor and left in position for the charge-makers to handle.

The making-up of a charge is as follows: The flux truck is run under the scales and placed in such a position that the flux, on discharging from the scale-hoppers, will split either into two or four charges, as required. Having carried out this operation with all the required fluxes, it is run down to the four tilting hoppers, and one compartment discharged into each, a charge of coke having previously been placed in the bottom. A truck of the H. H. product is then brought up and its contents dumped in, after which follows a truck of returned slag from the matte-shed, consisting of slag-pots and fore-hearth shells. The returned slag-cars are of a similar construction to the flux-wagon, except that they are not divided into four compartments, but only into the two made by the saddle.

Having completed the charge, the tilting hopper discharges into a charge-truck beneath. This truck is hauled up an inclined way to the top of the furnace by electric power, and so arranged that, as a full truck goes up, an empty one descends on the other side. On arrival at the furnace feed-floor, the feeder releases a catch, and the hopper, being slightly top-heavy, turns completely over, discharging its contents into the furnace.

The Sulphide Corporation, being a custom smelter, a large variety of ores has to be treated, resulting at different periods in furnace slags of varying composition. In consequence of this, it is difficult to give any definite type of slag run, but, as an illustration, the type being run at present is given below:

| | % |
|------------------------|------|
| Pb | 0.7 |
| FeO | 36.4 |
| MnO | 1.6 |
| CaO | 17.2 |
| SiO ₂ | 24.5 |
| ZnO | 12.0 |

This slag, as before mentioned, is tapped into cast-iron elliptical pots and poured over the dump. The lead is

tapped into small cast-iron pots, and run across to the drossing-furnace. This is a small reverberatory of about seven tons capacity, from whence two products are obtained—lead bullion (carrying most of the gold and silver) and dross. The dross, on being removed from the top of the lead, is still fairly 'wet', and is transferred to a liquating furnace, where most of the lead is sweated out and returned to the drossing-furnace. The more or less 'dry' dross is allowed to accumulate till there is sufficient to warrant No. 3 furnace being blown in, and the accumulated stock smelted. The lead from the drossing-furnace is tapped into two rings of 100 molds each, which revolve on their own axes. On cooling, the bars, which weigh about 85 lb. each, are stamped with a letter and number, in lots of 2600 bars, or nearly 100 tons, and sent for treatment to the refinery.

Lead matte, caught in the fore-hearths, is tapped into cast-steel molds, set in a revolving ring, and from thence carted to the Krupp mills at the roasting-plant, and crushed ready for incorporating in the H. H. mixture. Any lead found in the fore-hearths, which has not been previously tapped at the smelter, is cast into molds and sent to the drossing-furnace. In order to remove the shells, the fore-hearth is run into a tipping cage, which turns upside down, when, by means of a bar, the fore-hearth shell is knocked out.

The slag shells remaining in the slag-cars, after the liquid contents have been poured over the dump, are also brought back to the matte-shed, and tipped alongside the shells from the fore-hearth. A 3-ft. tramway runs through this building on a track sunk into the ground, so that the top of the return-slag trucks are on a level with the main floor. The various shells are broken up, loaded into these trucks, and drawn to the smelter-charge hopper by an electric locomotive. The only slag that is added to the smelter charge is that sufficient to keep these shells worked up.

EXPLOSIVES have been separated into the following classes according to their action: Where the material is to be displaced, but not shattered, a slow-acting explosive is required. Black gunpowder, with a velocity of explosion of 300 m. per second, is good. Blasting powder is still slower in action, and is suitable for quarrying where stone has to be obtained in large blocks. Bobbinite, still slower in action, is much used in coal mines with soft coal. All these are comparatively weak explosives, and large charges are required. Where great power and rending effect, with a moderate shattering effect, is required there is little to choose between the ammonium nitrate class and the perchlorate explosives, except that the former are the safer to handle, but most susceptible to moisture. Some grades of amatol made for military use would also be suitable, and vast quantities should now be available. Where the greatest power in the smallest bulk is required—as is the case where hard rocks are to be blasted and small drills are used—the nitro-glycerine explosives are best, as they have high density, great power, and high velocity of detonation.

Crushing Practice of the New Cornelia Copper Company

By W. L. DUMOULIN

*A detailed description of the entire plant and leaching process was given in a paper recently presented to the Institute,[†] so this paper will cover briefly only the crushing practice of the New Cornelia Copper Co. for the year 1918.

The ore, which is mined by steam-shovels and loaded in side-dump cars, passes through two crushing-plants. The primary plant reduces to less than 3 in. and the secondary plant to $\frac{1}{4}$ in., which is sufficiently fine for satisfactory percolation of solution through the ore in the leaching-vats, and to give good extraction. The ore is then conveyed to the leaching-vats by a system of 28-in. belt-conveyors. On the way to the leaching-vats, it passes through an automatic sampling-plant, where a 1% sample is taken.

From the primary-crushing plant, the ore is conveyed by two 36-in. belt-conveyors to a 10,000-ton steel storage-bin, with a reinforced-concrete flat bottom. The ore discharges from the bottom of this bin onto four 20-in. belt-conveyors, which deliver it to the four units of crushers in the secondary-crushing plant. There is no storage-bin between the mine and the primary-crushing plant. The ore breaks coarse, is hard, and contains many boulders, some as large as $4\frac{1}{2}$ by $4\frac{1}{2}$ by 10 ft. long. Jams form in the bowl of the coarse crusher in the primary-crushing plant, and are freed by means of an immense steel hook operated from a 40-ton electric traveling crane. The plants were constructed to crush the ore required by a leaching-plant of 5000 tons daily capacity, during a crushing period of 16 hours.

THE PRIMARY PLANT consists of one No. 24 Gates, style K, gyratory crusher, followed by four Gates No. 8, style K, gyratory crushers. All the ore from the mine is dumped directly from the mine-ore cars, loaded with about 35 to 27 tons of ore each, into the bowl of the No. 24 gyratory. This crusher will take boulders as large as $4\frac{1}{2}$ by $4\frac{1}{2}$ by 10 ft. and, as first set, reduced them to 9 in. at a rate of 500 tons of ore per hour. The ore crushed by the No. 24 crusher discharges into the bowls of the four No. 8 gyratories, after passing over grizzlies with 3-in. spaces. The No. 8 gyratories took the 9-in. discharge from the No. 24 and reduced it to approximately 4 in. There are two No. 8s on each side of the No. 24, which discharge onto one of the 36-in. belt-conveyors

carrying the ore to the 10,000-ton storage-bin. All crushers in this plant are belt-driven by alternate-current induction-motors.

We found that when crushing to the size indicated, the discharge from the No. 24 would flood the No. 8s; therefore, as the head is not adjustable, the bottom row of concaves in the No. 24 was replaced by a row of thicker concaves, and a new lower section of the mantle of larger diameter was placed on the head, so that this crusher now reduces the ore to approximately 6 in. This throws more work onto the No. 24 crusher and slows its rate of discharge sufficiently to give a fairly uniform feed to the No. 8s, resulting in an increase in the capacity and a reduction in wear and cost of repairs in connection with these smaller crushers. The increase in the capacity of these smaller crushers was so great that it was possible to set out the bottom row of concaves, and so obtain a produce of less than 3 in. This balances the work between the primary and secondary plants in a more economical manner. Previously, the rate of crushing in this plant was limited by the No. 8s, but now it is determined by the No. 24 gyratory, which has an average capacity of 400 to 450 tons per hour, crushing to less than 6 in., the rate depending on the proportion of large boulders in the ore crushed.

THE SECONDARY PLANT consists of four units of 48-in. Symons vertical-shaft (pillar) disc-crushers, each unit consisting of three crushers, one coarse Symons and two fine Symons. The coarse and fine Symons are identical with the exception of the upper disc, which, in the coarse crusher, has a grinding-surface 4 in. wide, and in the fine crushers 6 in. wide. Each crusher in this plant is driven by a special direct-connected 75-hp. alternating-current induction-motor having a speed of 400. As the ore is harder than anticipated, it was soon demonstrated that to crush the 5000 tons in the desired time would crowd the crushers too much for economical maintenance, so a fifth unit of three 48-in. Symons vertical-shaft disc-crushers has just been installed.

The ore from the primary-crushing plant is conveyed to the storage-bin of 10,000 tons capacity, from which it is fed to the coarse Symons at a uniform rate, and crushed to approximately $\frac{3}{4}$ in. The discharge from these coarse crushers is divided, one-half passing to each of the two fine Symons crushers in each unit, where it is crushed to approximately $\frac{1}{4}$ in. Screens ahead of the fine Symons crushers by-pass a large proportion of undersize. The capacity of a unit depends somewhat on the character of the ore, and varies from 90 to 100 tons per hour.

*Abstract of paper to be presented before the Chicago meeting of the American Institute of Mining and Metallurgical Engineers.

[†]H. A. Tobelmann and J. A. Potter: 'First Year of Leaching by the New Cornelia Copper Co.' February 1919.

The coarse Symons have a capacity of 100 tons per hour, crushing to $\frac{3}{4}$ in. with small cost of repairs; but the fine Symons have each a capacity of only 50 tons per hour crushing to $\frac{1}{4}$ in. with rather heavy repair costs. As this type of crusher may be considered in an experimental state for crushing as fine as $\frac{1}{4}$ in., it developed that certain parts of the machine required strengthening, when it was found advantageous to substitute cast-steel for cast-iron, as well as to otherwise strengthen this design. But even under these circumstances, this type of crusher has proved satisfactory for the service required of it and gives the most uniform product that has the minimum amount of oversize and fine. A great deal of trouble has been experienced with tramp iron in the crushers, but this trouble has been eliminated largely by the suspension of large and powerful magnets over the conveyors leading from the primary-crushing plant. These magnets were installed in addition to the magnetic pulleys already in service.

The records show that the manganese-steel wasted is as follows:

| | Per ton of ore crushed |
|---|---------------------------|
| Primary-crushing plant: | Lb. |
| In all mantles of gyratory crushers..... | 0.0032 |
| In all concaves of gyratory crushers..... | 0.0081 |
| Secondary-crushing plant: | |
| In all discs of Symons crushers..... | 0.059 |
| Total babbitt used in each plant: | |
| In primary-crushing plant..... | 0.0045 |
| In secondary-crushing plant..... | 0.0097 |

The above items are given as they represent figures on the parts most subject to wear. The power consumption of each plant per ton of ore crushed was as follows:

| | |
|--------------------------------|--------------|
| Primary-crushing plant | 0.21 kw. hr. |
| Secondary-crushing plant | 0.701 " " |

All the preceding figures are averages for the year 1918. The total tonnage crushed during the year was 1,775,000. The following is the average screen-sizing test for the year. The samples were taken from the discharge from the fine Symons disc-crushers onto the conveyor carrying this crushed ore to the leaching-vats:

| | |
|--------------------|--------------------------|
| On 3 mesh.....26.7 | On 10 mesh..... 7.0 |
| On 4 mesh.....17.3 | On 14 mesh..... 4.9 |
| On 6 mesh.....12.7 | On 20 mesh..... 4.1 |
| On 8 mesh..... 9.0 | Through 20 mesh.....18.3 |

Ore crushed as indicated by this screen-sizing test gives satisfactory results in the leaching-vats.

Helium

One of the greatest scientific and technical triumphs resulting from the application of exact knowledge and inventive genius to problems of military importance has been the large-scale production of helium, making this hitherto exceedingly rare gas available for use in balloons and dirigibles. Helium is widely distributed in nature, but generally in minute quantities. The amount of it in the earth's atmosphere is exceedingly small, being present in the proportion of only 1 volume to 250,000

volumes of air. It has been found imprisoned within radioactive mineral substances, in the gases evolved from some thermal springs, in those emanating from volcanoes, and also in the natural gas of several gas-fields in the United States (notably in Kansas, Oklahoma, Ohio, and also Texas). In some of the natural gas of this country it is present in amounts as high as $2\frac{1}{2}\%$. It is one of a series of rare inert gases—other members of the series being neon, argon, krypton, and xenon—all of which are present in very small quantities in the atmosphere. Thus far every attempt to make these gases enter into chemical combination has failed. Helium is, next to hydrogen, the lightest of known substances. The gas, although twice as heavy as hydrogen, has in balloons a buoyancy or ascensional power of 92.6%, as compared with the latter. The reason for this is that the buoyancy of a gas is measured not directly by its weight, but by the difference between its weight and that of the air displaced. Both hydrogen and helium are so light as compared with air that the difference in their lifting power is relatively insignificant. For example, 1000 cu. ft. of pure hydrogen will lift a weight of 75.14 lb., whereas the same amount of pure helium will lift 69.58 lb., and a mixture, containing 85% helium and 15% hydrogen, which is the gas contemplated for all-around aircraft use, will have 93.4% of the lifting power of hydrogen and will lift 70.18 lb. In its physical behavior, helium is the nearest approximation to the ideal perfect gas. It is monatomic and liquefies at even lower temperatures than hydrogen. Helium has been proved to be the end-product of the emanations of radioactive substances, but the origin of its presence in natural gas has not been established. The helium content of some natural gas is relatively so large and the radiation from radioactive material is so small that derivation from such material would seem entirely out of the question. In the whole world not more than three ounces of radium has yet been isolated; but it must be remembered that radioactive material is very widely distributed in nature and that helium generation has been going on through countless ages of past time. A great many factors enter into this question, however, and its solution is difficult. Helium is of prime importance in aeronautics because of its great buoyancy, because of its rate of diffusion and consequent wastage through fabrics being only half that of hydrogen, and, above all, because of its chemical inertness. The effectiveness of hydrogen-filled dirigibles in war, owing to the high inflammability of hydrogen, was reduced to the vanishing point when means of combating them with incendiary projectiles were developed. Even under peace conditions, the great hydrogen-filled envelope of the dirigible constitutes a serious hazard because of possible ignition from atmospheric electricity, or from flames originating in the power plant of the craft. Helium, however, being absolutely inert, cannot be ignited or exploded, and even mixtures containing certain amounts of hydrogen with helium can, as has been indicated above, be used with perfect safety in lighter-than-air craft.

REVIEW OF MINING

CALIFORNIA

NEVADA AND SIERRA COUNTIES.

NEVADA COUNTY.—The machinery at the Union Hill shaft is being removed to the Idaho-Maryland ground to be put in place immediately. This is the active beginning of the long heralded operations to commence on the latter mine under the new organization, which includes the Idaho-Maryland, a one-time famous producer, and a number of other mines of lesser importance. The Alcalde company, formerly the Kenosha, west of Grass Valley, has made a beginning and soon will be bailing out the mine. The Central Consolidated on Greenhorn creek, three miles south of Nevada City, is to be rehabilitated. The mine was operated up to a couple of years or more ago with a complete 20-stamp mill, compressor, and electric hoist inside a tunnel over a shaft 1200 feet deep. Every part of the plant was removed after closing down. Supplies and a crew were sent to the mine recently for preliminary work. A boarding-house will first be constructed. John Nichols of San Francisco is on the ground and Paul W. Smith of Downieville, the former superintendent, will again have charge.

SIERRA COUNTY.—The Sixteen to One and Twenty-One mining companies at Alleghany are again in litigation and the case was set for hearing August 20 in the U. S. District Court at San Francisco. This hearing is but the continuation of a contention heretofore existing between them and supposedly settled over apex and vein formation; and although the point is apparently of minor importance it may resolve itself into a precedent. The Twenty-One company seeks to restrain the Sixteen to One people from mining along the vein, in the walls, which the defendant company claims was granted to it by a former decision from the same court, and it also claims the right to follow the vein granted by statute and to break into the walls whenever necessary during mining operations. The proceedings are in the form of an injunction. While on his way to San Francisco to appear as a witness in the case, Elisha Hampton, a well-known mining man of Nevada City, was instantly killed near Vallejo on August 20 by the overturning of an automobile. Mr. Hampton had been connected with the Alaska Treadwell, and with many other mines in Tonopah and Amador county.

Ambrose Madden, owner of the Kanaka mine, near Alleghany, recently struck a small bunch of quartz and arsenical sulphurets, twelve pounds of which netted him over \$100, and he is now running a drift to intersect two

veins from a 350-ft. tunnel. The three Kluffer brothers gravel claim at Poker Flat, near La Porte, has been bonded to Dan McGonigal of Nevada City. The tunnel is going ahead and new buildings are being erected before the setting in of winter.

NEVADA

THE STRIKE SITUATION.—GOLDFIELD, EUREKA, MONTEZUMA, GOLD MOUNTAIN.

With the Ely, Tonopah, and Divide mines inactive as the result of strikes and the miners of Virginia City remaining at work only at the urgent request of Governor Boyle, the labor situation in Nevada is serious. Mines in the Copper Basin district of Humboldt county also are closed as the result of a strike. In the four big districts the workers are demanding a flat increase of \$1 per day. At Copper Basin they are demanding 50c., with the charge for board to remain at \$1.25 per day. At Ely the operators have offered a 75c. increase, which the miners have rejected. At Tonopah, Divide, and Virginia City wage increases have been refused. In the two southern districts the operators have offered to establish a general store and sell articles at cost, with a workers' representative present to see that this is done, but the offer has been rejected. The Tonopah and Divide scale provides \$5.50 for machine men doing lateral work, with \$6 for men employed in shafts. The first move was made by the men of the Victory, Belcher, and Belcher Extension in the new district, when on completion of shaft work, they walked out, refusing to accept a 50c. cut for driving. The formal demand was made by the Tonopah men, with the support of the Divide miners. The result of a shut-down at Virginia City would be disastrous, as the flow of water in the deep mines of the district is heavy and a force of men is necessary to keep them in condition. There is water in only one Divide shaft, the Gold Reef, and there the flow is light. The hoist engineers did not join the walk-out in Tonopah and Divide.

Governor Boyle and Federal labor commissioners have been active in attempting to settle the trouble at Ely, and the Governor has addressed the miners at Virginia City, but without result. The labor commissioners are en route to Tonopah on request of the workers, but in view of the emphatic statement of George Wingfield, one of the largest operators at Divide, that he will close the mines he controls in preference to granting an increase, it is considered doubtful whether they will be able to accomplish anything. Miners from all districts affected,

particularly those in the southern part of the State, are entering Arizona rapidly, and one result has been the relieving, at least temporarily, of a shortage of miners at Goldfield, a junction point on the railroads leading south. The wage scale at Goldfield is the same as at Virginia City. It is estimated that 250 men left Tonopah on the first three days of the strike.

GOLD MOUNTAIN.—The Washington Gold Quartz Mining Co., which has been developing on a small scale the old Randolph mine at Gold Mountain, 40 miles southwest of Goldfield, has been completely financed and, according to J. K. Turner, general manager, a large force of miners will be employed for further exploration. The Washington Gold Quartz is a reorganization of the Randolph Mining Co. and A. S. Terrell of Chicago, who is reported to have spent over \$100,000 as one of the principal backers of the old company, is president of the new organization. The Gold Mountain in which the mine is situated is not the district recently renamed Divide. Both are in Esmeralda county. The Randolph company did 2200 ft. of development work and, although figures are not available, according to Mr. Turner, who has been familiar with the mine for many years, the production was large. A 726-ft. tunnel was driven in the Randolph vein and at the mouth of this tunnel a 410-ft. shaft was sunk, from which several hundred feet of driving was done. The ore is lead carbonate and sulphide and contains gold and silver. There are two grades, milling and smelting, 10 tons of the former being exposed to one of the latter. The average value of the milling ore is \$15 and of the smelting ore \$40. There is no ore actually blocked out in the mine, the object of all work done by the former management having been to gain depth. The formation in the district is principally granite, with some quartzite, shale, and limestone. There are three well-defined veins, the main one, the Butte Goldfield, being exposed on the surface for several miles. This vein is named from the Butte Goldfield claims, owned by a company of that name and on which a comparatively small amount of development work has been done. It has been opened at a number of places, showing a width of from 5 to 15 ft. Little work has been done in the other two veins. The new management will resume sinking the shaft and will do the first lateral work at 600 ft. The vein is leached at 200 ft., the greatest depth at which it has been opened, and it is the belief of Mr. Turner that the metallic content will be higher at greater depth.

GOLDFIELD.—The Silver Pick has started cross-cutting into the Mohawk No. 2 claim on the 350-ft. level. Part of this claim is leased from the Goldfield Development company. The company is driving in the Silver Pick vein in this claim at a depth of 700 ft. The new work will be for the purpose of exploring the Mohawk vein under the place where ore has been found in an old lease shaft. A drift is being driven south-east in the Merger, following the fault recently found at 910 ft. Good ore was found in the drag from this fault and the drift is being driven to prospect for the source. No work has been done recently in driving the drift on the 365-ft.

level of the Great Bend owing to a heavy flow of water which damaged the timbers. Repairs have now been completed almost to the face of the drift. Jack-hammer drills formerly used at the Copper Canyon mines near Battle Mountain are being used in the Florence, resulting in a reduction of operating costs, according to the Florence superintendent. The west drift on the seventh level, being driven into the hanging wall of the vein, is cutting seams of good ore. This drift will be driven 365 ft. into the wall. A south-east drift has been started from the shaft on this level to cut what R. C. McCarthy, superintendent, believes is the extension into the Florence of the Jumbo vein.

The Goldfield Development Co. is moving to the mill 9000 tons of ore broken in the Red Top and after the workings on the 165-ft. level have been cleared sufficiently, additional prospecting will be done in the hanging wall of the vein and further blasting done. Twelve 6 by 10-ft. raises have been completed in the Combination, and one furnished a surprise by breaking \$25 for the entire height of 50 ft. These raises are being driven in solid rock to tap the stope filling above the 380-ft. level. A 70-ft. head-frame has been erected over the shaft through which the Combination, January, and Florence ore will be hoisted and a 500-ton ore-bin is half completed at this shaft. The bin is constructed so that additional units may be added. Two 3-ton skips, operated by a 150-hp. motor, will be used. A 1000-ton bin has been excavated at the 380-ft. level.

MONTEZUMA.—O. R. Whitaker, O. W. Whitaker, and Harry Moon, owners of the Monitor group in the old Montezuma district, 12 miles west of Goldfield, have opened at the surface, at 50 ft. and at 100 ft. an ore-shoot $3\frac{1}{2}$ ft. wide. The ore is silver-lead and assays \$75 per ton. The Monitor group adjoins the patented claims of the Montezuma Mining Co., from which ore was shipped to Candelaria in the early days. Drifts have been driven in ore for 15 ft. on the 50 and 100-ft. levels. The ore is found in the farthest west of three veins striking north. Within 100 ft. of the farthest east of these veins and paralleling them is a cross-cut tunnel that enters a vein striking west. This west vein was stoped by former owners from the surface to 80 ft. and for a length of 150 ft. Turning the tunnel west, the present owners cross-cut the three veins striking north and shipped ore from all at a point 100 ft. beyond the faces of the drifts from the shaft, indicating that the ore-shoot may be this long. Starting from the surface, 87 ft. of sinking and 67 ft. of driving was done by O. R. Whitaker without assistance. A 1-hp. engine, connected with belts to a hoist made by Whitaker, was used.

EUREKA.—The ore recently discovered at a depth of 900 ft. in the Eureka-Croesus has been opened to a width of 25 ft. assaying 4 oz. gold, 277 oz. silver, and $61\frac{1}{2}\%$ lead. The ore was opened in a winze from the 400-ft. level of the Catlin shaft, on the Connolly claim. This shaft was sunk to explore the stopes in the Home Ticket and Dunderberg claims, which were producers of rich gold-silver-lead ore in the '70s, and it was by following

the opening of these stopes that additional work resulted in finding the 25-ft. orebody. The company is preparing to ship 50 tons of this ore daily. This is the third important orebody to be found through the Catlin shaft in territory not explored in the early days, and it is at least 400 ft. below the greatest depth attained by former managements in mining in this part of the claims. The production of the Eureka district came principally from the Dunderberg and Home Ticket, and it is estimated that there are from five to eight miles of workings in the former, with 1,000,000 tons of ore of an average value of over \$25 per ton, much of which is stope filling. It is estimated that \$100,000,000 worth of ore has been produced from the district from the early '70s, when the first important work was done, to date. Following a long period during which experiments were conducted, it has been announced that a 250-ton flotation plant is to be built, later to be enlarged to 1000 tons capacity. This plant will also treat ore from other mines, where huge quantities of low-grade ore are exposed.

OREGON

GENERAL NEWS.

GOLD HILL.—The field party of the engineers and geologists of the Oregon Bureau of Mines and Geology is making its headquarters at Gold Hill for the next few weeks. The party has spent two months in the mining districts north and south of Gold Hill and during that time has examined, by request, a number of mines and prospects that are being developed and operated. Surveying, mapping, assaying, geologic study or whatever was required to assist the development of southern Oregon mines was done. Some of the better known deposits that have been thus examined in detail are the Blue Ledge (copper), the Opp (gold), the Sterling (placer gold), and the War Eagle (mercury). Several Gold Hill mines are slated for examination, after which the party will make its headquarters at Grants Pass, and later in the Waldo district. The field party is in charge of G. E. Stowell, assistant mining engineer, under the direction of H. M. Parks, director of the Oregon Bureau of Mines and Geology. It is likely that the party will return to Medford late this season.

A mining deal involving a purchase price of \$50,000 was closed and filed in Josephine county recently, when a group of copper claims in the Grave Creek district, west of Gold Hill, was sold to the International Copper Co., an Arizona corporation. The payments extend, in installments, to January 1920. The proposed extensive improvements on the Almeda copper and gold mine on Rogue river, west of Grants Pass, have been suspended by reason of the revival of the litigation between rival stockholders and directors of the Almeda Mines Co. and the Almeda Consolidated Mines Co. Suit was recently started in the Federal court of Portland, when one stockholder brought the suit against the other stockholders, as well as the directors and State officials, for a complete accounting of all affairs of the two concerns. The amount involved runs high into the millions. The same litiga-

tion has been before the same court on former occasions after passing through the Courts of Josephine, Douglas, and Multnomah counties in Oregon. The plaintiff asks that the Federal court nullify the proceedings now pending in the circuit court of Josephine county, and that the entire property involved be awarded to the Almeda Consolidated Mines Co. against the Almeda Mines Co. The plaintiff charges many of the officials with fraud and deception, and alleges that the original litigation, dating several years back, was commenced as a means by which the opposing parties could procure control of the property.

MEXICO

CANANEA AND SONORA.

CANANEA.—The Cananea Consolidated Copper Co. has posted notices that wages of employees will be increased to the same figure paid last December or to P4 and P5 per day for muckers and miners, respectively. This is an increase of 50 cents per day. It is currently reported in Cananea, although not yet confirmed, that the company proposes in the near future to increase its forces by the employment of about 1000 additional men in the mines, mill, and smelter divisions. There also are unconfirmed reports that the Democrata mine owned by the Hoffman interests of Cincinnati, Ohio, which has been closed for several months, will resume work soon. The

Calumet & Sonora property also is expected to go to work again within the next few weeks. The Promontorio mine of the Moctezuma Copper Co., a Phelps Dodge subsidiary near Moctezuma, Sonora, plans to resume work on high-grade copper ore in the near future.

SONORA.—In spite of washouts, which prevented the bringing of ore in appreciable quantities over the Nacozari railroad during the last week of July, the export record for that month lacked little of the usual average, according to the records of the Agua Prieta customs house. The very respectable total of 8944 tons of ore and concentrates, valued at \$1,985,700, Mexican gold, was made. The statement of shipments follows: Nacozari district, 8452 tons; El Tigre, 281 tons; San Jose, 21 tons; Santa Rita, 7 tons; Granadita, 7 tons; Escuadra, 20 tons; Nuevo Potosi, 20 tons; La Nueva Amistad, 11 tons; La Cruz, 41 tons; San Pablo, 46 tons; Esperanza,

8 tons; Vetarron, 30 tons. Plans are being made for overhauling the concentrator of the Moctezuma Copper Co. at Nacozari. A flotation process may be added to the plant and tests are being run on the ore at the Copper Queen smelter, it is understood, with the idea of determining what equipment will be needed. Good reports continue to come in concerning the mining activity in the part of Sonora tributary to Douglas. At the San Nicolas in the Cumpas district, the reconstructed concentration mill, including a 50-ton flotation plant, is now in operation. The present daily output averages two tons of concentrate from about 40 tons of ore. The average grade of the concentrate is 800 oz. silver, 80% lead, and 6% copper. The concentrate is hauled by wagon to Nacozari and shipped from there by way of Douglas to the El Paso smelter. The property is operated by the Desarrrolladora leasing company, of which Marion Williams is president, F. H. Fisher treasurer, Carl Knudson manager, and Leo J. Cloud director. A force of 50 men is employed. The North Tigre property, near El Tigre, is constructing a concentrator which is expected soon to be in operation. The property has large proved ore-reserves, developed during several years, which are sufficient to guarantee many years mill run at present capacity of 50 tons daily. Power for operation of mine and mill machinery will be obtained from the transmission line from the Copper Queen smelter power house which now serves El Tigre. R. D. Brown, of Douglas, is president of the company and Frank Holmes the manager. The Cinco de Mayo at Pilares de Terras, not far from El Tigre, after passing through a checkered career of several years, during which it has been operated for a time under private lease and for a time under management of officials appointed by the State of Sonora, soon will be returned to the widow of Col. Francisco Garcia, the original owner. The property was confiscated by the State government because of the alleged reactionary politics of its then owner, a former Diaz official. State operation of the property proved a costly failure, owing to poor methods employed, even though considerable rich ore was extracted. In removing the richer orebodies the waste and low-grade was left in the workings. It is stated that this method was used to such an extent that it will be necessary practically to re-open the ground from the surface in order to get at the ore. The extent of these bodies is such that the move would be justified, however, once the title has been assured. Captain Barnett, manager of the Roy mine, which adjoins the Cinco de Mayo, was in Douglas recently to report to Col. B. A. Packard, the owner, the result of a test-run made in the recently completed 50-ton mill. The test showed a recovery fully up to the expectations of Colonel Packard, but developed a few mechanical imperfections that will have to be corrected before the mill can enter continuous operation. Captain Barnett while in Douglas obtained the needed parts and by September 1 the mill is expected to be operating on the Roy's silver-lead ores. A considerable quantity of low-grade for mill-run has been mined and stacked.

BRITISH COLUMBIA

GENERAL NEWS OF THE PROVINCE.

Foreclosure proceedings are to be taken against the Lucky Jim mine, at Zincton. The foreclosure is to be made on a second mortgage, amounting to \$35,000. A first mortgage of \$50,000 was foreclosed in 1915, and A. G. Larson was placed in charge of the mine as receiver-manager. During his tenure of office he sold some \$200,000 worth of ore, making a profit of \$80,000. The first mortgage was paid off, a floating debt of \$14,000 was settled, and \$7500 was placed in trust against the second mortgage. The mine was then closed down. Last year the capital of the company was increased from \$3,000,000 to \$6,000,000, but, it is stated, the accounts of the transaction seem to be in a muddle. When the present foreclosure proceedings have placed the mine in the mortgagee's hands the company will be re-organized and, according to Lendrum McMeans, who is acting for the mortgagees, every shareholder will be given an opportunity to participate on an equal basis. The Canada Copper Corporation and its employees have settled their dispute, and operations are to be resumed at once. The trouble, which lasted four months, probably will delay the starting of the new concentrator until next spring. After a dispute between the Western Fuel Co. and its employees, the company has agreed to raise the rate of wage at its Nanaimo mines 25c. per shift.

Arrangements have been practically completed by which the Canada Copper Corporation will sell the Dominion property, at Phoenix, and the smelter, at Greenwood, to citizens of Greenwood, who propose to re-start the smelter. A car of manganese ore has been shipped from Hill 60, Cowichan lake, to Tacoma, where it will be converted into ferro-manganese. This property was staked last year, and several bodies of manganese ore, running from 40 to 55% manganese, have been exposed by open-cutting and stripping. Analyses show the ore to be low in sulphur and phosphorus, but fairly high in silica. There appears to be every indication that there is a good-sized body of ore. A car of ore shipped recently from the Silver Bell mine, Kaslo creek, ran 238 oz. in silver, 31% lead, and 7% zinc.

ALBERTA

STRIKE AT CROWS NEST PASS SETTLED.—IMPERIAL OIL CO. TO DRILL NEAR LETHBRIDGE.

The Crows Nest Pass miners have voted to return to work. The miners from the Drumheller field in Alberta returned to work last week, and those at the Galt mine, at Lethbridge have voted to return. The strike has been broken none too soon, as fuel conditions in the Prairie provinces were becoming desperate.

Charles W. Taylor, chief geologist for the Imperial Oil Co., who has had 12 parties exploring in the foothills of Alberta since the early spring, has announced that a site has been selected to the south-west of Lethbridge, and drilling for oil will be started as soon as the necessary machinery can be got to the spot.

CALIFORNIA

Downieville.—C. D. McGonigal has taken the Gibraltar mine under bond from the Kieffer brothers. The tunnel is being pressed ahead to tap the main channel, and construction of surface buildings is proceeding. The Gibraltar produced well in past years.—Another shift has been added to the working force at the Brown Bear gravel mine, and development of the channel is proceeding vigorously. The channel was intersected recently, and rich gravel exposed. The company is improving its equipment and laying in supplies for the winter.—Work has been resumed at the Trinity quartz group on Spanish creek. A strong vein of milling ore has been opened and conditions are considered excellent for early production. Thomas Trinity is managing owner. The property is near Goodyear Bar.

Nelson Point.—Good ore containing payable quantities of gold, silver, platinum, and copper has been uncovered in the Gold Drift mine, according to reports from the property. The property lies three miles from Nelson Point and is being vigorously developed. The management is contemplating erecting a 20-stamp mill early in 1920. Charles A. Haas is manager.

Sawyers Bar.—Rich gold-bearing gravel has been uncovered in the Hickey Gulch property, which was recently re-located by Fred Meyers and Edward Hickey. It was discovered 20 years ago by Meyers and worked to some extent. Several small nuggets and much coarse gold has been found in the past two weeks, and the deposit appears of considerable value.

Washington.—With R. H. Conrad in charge, operations have been resumed at the Sierra asbestos mine, owned largely by Oakland residents. The ore is quarried and the fibres separated from the rock by a combination milling and separation process. Heavy shipments to San Francisco will be resumed soon.

COLORADO

Chandler.—The Chandler Petroleum Oil Co., which is drilling a well near Bumback Springs, is obtaining favorable results. At 500 ft. a small amount of oil was found, and the strata the company has been drilling in for the past 200 ft. indicate excellent oil possibilities. Geologists estimate that oil will be found in good quantities at 1500 to 1700 ft. The property has a standard rig and is well equipped to drill as deep as may be necessary. William Lloyd is president of the company and the chief shareholder. The company has been financed by 28 stockholders. In the past few weeks several different Texas and Oklahoma people have been attracted to the property by the showing that has been made, and the territory round about has been thoroughly investigated by different geologists representing them. According to those in touch with the Chandler well, these men have declared the prospects far above the average.

Denver.—Net earnings of Colorado Fuel & Iron Co. for the quarter ended June 30, after deductions for bond interest, taxes, sinking fund, and other fixed charges, were \$627,154, compared with \$1,700,170 for the same period of 1918, according to the quarterly statement of the company just made public. Gross receipts in the second quarter

of 1919 were \$10,529,414 and operating expenses were \$9,385,099, leaving a net operating income of \$1,144,315. Additional income from other sources amounted to \$132,815. Deductions for fixed charges were \$649,976. In second quarter of 1918 gross receipts were \$12,812,003; operating expenses, \$10,474,161, and net earnings from operations \$2,337,841, while income from other sources amounted to \$128,124, and deductions for fixed charges \$765,966.

Grand Valley.—N. W. Bansill and M. Mulling of Las Vegas, New Mexico, directors and stockholders of the Champion Oil Shale & Refining Co., were in Grand Valley recently to consult with their local manager, J. L. Herrick, with regard to the patenting of the property in the Grand Valley shale district and the completion of the road to the company's holdings. A plant is to be installed as soon as delivered and an order has been placed in Denver for re-torts and other necessary material. The Champion Oil Shale & Refining Co. also holds leases on 160 acres of oil lands in Oklahoma and 480 acres in Texas.

Kokomo.—The Star of the West group on Jacque mountain in the Ten Mile mining district of Summit county, at the present time under lease to Stillwell Connor of Denver, formerly a well-known and successful Cripple Creek district operator, has recently been examined for Chicago and New York investors holding an option on the controlling interest in the Star of the West company, owned by the estate of the late Charles J. Moore. The property is now producing and the dumps are said to contain silver ore that can now be shipped at profit. These are being sorted over by the lessee. The consideration asked has not been made public, but with a record in excess of \$2,000,000 production with comparatively light development, the price is understood to have been around a million dollars.

Leadville.—The mining developments this season in the St. Kevin district are very encouraging to those interested in that part of the country. A strong leasing company has secured the Griffin property, and development work is to be carried on with a complete electrical plant, the power-line of the Colorado Power Co. being now extended to that point. The old Griffin tunnel is in over 1000 ft. and there is a good vein showing in the face. This tunnel will be driven ahead several hundred feet farther to a point where it is expected that even better results will be secured.—The New York owners of the Matchless mine on Fryer hill have determined on a vigorous campaign of development of the famous old bonanza, and operations have already started. Dr. Bailey of New York is in charge of the work. The surface plant has been put into good shape, and after necessary repairs to the shaft it is understood that sinking will commence.—The Colorado Power Co. is extending its line to the Hill Top mine, which is one of the most extensive lead producers in this part of the State.

Rico.—Ore shipments from the Rico station for the month of July were as follows: Marmatite Mining & Milling Co., 7 cars of copper ore to Durango; Valley View, 1 car lead-silver to Durango, Colorado. Total, 48 cars.

Emmett Nutter, who has been operating the Iron mine for some time, has incorporated a company named the John Doyle Mining & Milling Co., which will operate the Iron

mine from now on. It is now taking out some rich ore from a cave-in caused by a slip in the main tunnel. This ore runs as high as 1000 oz. of silver and 10% copper. It is not yet known what the slip will show with development. On the Missouri lode a tunnel has been started that is intended to cut the main orebody of the Iron mine vein. The tunnel is east of the Blackhawk tram terminal and will be about 600 ft. deep. On Expectation mountain Mr. Nutter has taken a lease and bond on the St. Louis and Bancroft claims, belonging to S. M. Ransom. He also has a lease and bond on the Iron Clad, owned by V. J. Kraft. The former claims will be worked through the Iron Clad tunnel.

IDAHO

Adair.—The Richmond Mining, Milling & Reduction Co. shipped four carloads of copper ore between August 1 and 16 and will probably increase the number to seven by the end of the month, according to J. E. Codd, president. The chief source of ore is the 260-ft. level, where a large body of mixed carbonates and sulphides is being opened by a drift and a stope, but other scenes of development are supplying

re-concentration of 1000 tons of concentrate for shipment to the smelter, the lower grade concentrate to be cyanided on the property, using the Koering machine process. The company is also contemplating re-concentration of a tailing dump of 3000 tons, which averages approximately \$8 per ton. Capital is now being raised for development work, which will consist largely of driving a tunnel 1000 ft. below the present level in order to reach the old workings. A 300-ton mill will also be erected. The present equipment consists of a 15-stamp mill. The main office of the company is in the East, and it will be financed through the Michigan Investment Co. of Grand Rapids, Michigan. Ben R. Koering is superintendent.

Wallace.—The strike at the Morning and Hunter mines at Mullan, the Hecla and the Hercules at Burke, and the Interstate-Callahan and Tamarack at Nine Mile, has been notable for the absence of disorder. The various companies maintain watchmen at the mines and mills, most of whom have been commissioned as deputies by Sheriff Scott, who has also taken other precautions to meet any emergency that

THE ELM ORLU MINE

their quota. The width of the shoot on the 500-ft. level has increased to five feet in the face of the drift. The ore is solely a sulphide and its quality is good. Much of it is of a shipping grade and some of it, contained in chunks, has a copper content of 30 to 35%. The ore will be sorted and what is not shipped will be saved for concentration.

Dixie.—A. H. McKnight, president and manager of the Swastika Mines corporation, is en route to the holdings at Dixie from Washington, D. C. The Swastika has been opened by several thousand feet of workings and a large quantity of low-grade ore is reported to have been uncovered. A few gold prospects have been partly developed in the Dixie district, where some exceptional placer properties have been responsive, but, owing to the lack of transportation, it has been difficult to interest capital in them. The completion of the new South Fork highway to serve the Dixie country is expected to stimulate mining there.

Pioneerville.—The Golden Age Jr. Mining Co., in the Boise Basin country on Grimes Pass, is now working on

may arise. So far as reported, however, there has been no disturbance and no arrests made in connection with the strike. The strike call included pumpmen and some difficulty was first experienced in keeping the pumps in operation. This was soon overcome by the companies and the mines are now amply protected. When the walkout took place about 30 men remained at work at the Hecla, practically all of whom were employed in the machine-shop and other surface work. It was stated that the number has since been increased to about double that number, but none of them is employed underground. With the exception of the Hecla all other mines affected are closed down tight. Since the strike was called it is estimated that about half the men have left the district. The issue has been reduced to the demand for eight hours "from portal to portal", and if this should be conceded it has been officially stated by the union that the strike would be called off. The mining companies, however, show no disposition to make any concessions on this point, although willing to make every effort to expedite

the movement of men to and from their work in order to reduce the time underground to the lowest limit possible. The strike was called by the Coeur d'Alene district union of the International Union of Mine, Mill, and Smelter Workers and without the sanction of the international body. For this reason it has been believed that the international would bring pressure to bear that would result in calling the strike off. Efforts are no doubt being made in that direction and there is reason to be hopeful that they will prove successful. Many of the union men were opposed to the strike and still feel that it was ill-advised and would be glad to have it called off and return to work. With the disappearance of the more irresponsible element from the district, it is hoped that the influence of the conservative element will make itself felt.

MONTANA

Butte.—The Elm Orlu case was settled on August 25, after a trial lasting four weeks, when Judge Bourquin, in the United States District Court, approved the formal decree of settlement. By the stipulation of the agreement the Elm Orlu, which is owned by the Clark-Montana Realty Co., was awarded 186 ft. additional eastward on the Rainbow vein below 1200 ft., and the Butte & Superior Copper Co. that portion above 1200 ft. The Jersey Blue vein west of a new plane below 1300 ft. is awarded to the Elm Orlu. Each side pays its own costs. Those interested may find the geology and legal points involved in an article, 'The Elm Orlu Case,' in the 'Mining and Scientific Press' for May 10, 1919.

NEVADA

Pioneer.—W. J. Tobin has returned to Pioneer to personally direct operations at the Reorganized Pioneer group. The shaft has passed the 500-ft. point and is going down in rhyolitic breccia. The shaft is expected to reach water-level at an approximate depth of 800 ft. and from this point drifts will be thrown out to reach the Pioneer vein. This orebody produced much high-grade ore above the 400-ft. level, but later faulted. Equipment includes steam-driven hoist, compressor, and mill.

Reno.—Nevada Rand Mines Co., operating in Rand mining district, has purchased a mill with capacity of 30 to 40 tons daily. The management reports a large reserve of milling ore, with good ore on the 200-ft. level. Six cars of \$45 ore were shipped recently. C. G. H. McBride, of San Jose, California, is president, and W. V. Rudderow, of Reno, secretary. C. E. Hymer, of Rand, is manager.

Reservation.—Contracts have been let by the V-7 Mining Co. for sinking the new 50-ft. shaft to a depth of 200-ft. Cross-cutting will start in a short time from the 50-ft. level to reach the high-grade vein of silver-lead ore exposed in the 100-ft. shaft. The vein is 30 in. wide and samples \$50 to \$145 in gold, silver, and lead. E. L. and G. A. Peacock, William and B. B. Percovich, J. C. Nagel, Daniel Darnell, W. C. Walker, and George Jamieson of Oakland are heavily interested, also F. L. Wildes and W. E. Casson of Carson City, and George L. Hedges of Reservation. The last is manager.

Tonopah.—Elkton Divide Co. has been incorporated by Nevada and San Francisco people to operate in the Divide and Reservation districts. Two claims have been acquired in the north end of the Divide district, and a three-year lease taken on a claim carrying high-grade silver-lead ore about two miles from Reservation, in the Mountain View district, Mineral county. Operations on the lease are to commence about October 1. It is officially stated a good tonnage of shipping ore is exposed. C. H. Church, Tonopah, is president; E. R. Yerington, Carson City, vice-president; S. C. Jameson, Tonopah, secretary-treasurer and manager. Principal owners include F. T. and C. F. Krebs of San Fran-

cisco, and Wills Brougher and W. E. Casson of Carson City, Nevada.

OREGON

Greenhorn.—A. R. Sweet and Spokane associates have purchased the Humboldt gold mine at Greenhorn. The property is equipped and ready for operation. There is a modern three-stamp mill with heavy Merrill stamps, together with crushers and concentrating tables, all capable of handling 20 tons per day. The ore is found in a four-foot vein and runs from \$4 to \$20 per ton. Most of the good ore is included in two feet of the vein.

UTAH

Alta.—J. D. Lewis, manager of the Alta Consolidated, reports the company is driving a drift on the Copper Prince level along the Hoboken fissure to intersect a big bedding of copper sulphides which, it is expected, will be caught at a distance of about 400 ft. The company, he says, already has ore of the same general character, only higher grade, at other points.

Bingham Canyon.—The report of the Utah Copper Co. for the second quarter of 1919 shows an operating profit of \$1,043,758, compared with a deficit of \$12,948 for the first quarter. Production of copper in concentrate and precipitates from the leaching-plant for the second quarter was 28,046,978 lb., an average of 9,348,993 lb. per month, compared with 29,261,209 lb. for the first quarter. The report says in part:

During the period there was treated at the Arthur plant a total of 1,242,500 tons, being 284,000 tons less than for the preceding quarter. The average grade of the ore was 1.35% copper, as compared with 1.27% copper for the first quarter, and the average recovery was 81.80%, as compared with 74.70% for the preceding quarter, being a decided improvement. The average cost per pound of net copper produced, including plant depreciation and all fixed and general charges, but excluding Federal taxes, and without credit for gold and silver or miscellaneous income, was 11.59c., as compared with 13.72c. for the first quarter, calculated in the same way. The value of the gold and silver in concentrates and the miscellaneous income for the quarter amounted to 5.40c. per net pound of copper produced. The earnings for the quarter are computed on the basis of 14.74c. per pound for copper, as against 12.89c. for the previous quarter. The low carrying price is due to the small sales of copper made during the period and the increase in the amount of copper unsold and carried at 13½c. per pound. The regular quarterly disbursement of \$1.50 per share was paid on June 30. Operations were continued on the curtailed basis of approximately 50% of normal. The operating cost per pound of copper for the quarter is lower than it has been for a long time, fulfilling the prediction made in the report covering the first quarter of this year. During the period there was removed a total of 333,048 cu. yd. of capping, being an average of 111,016 cu. yd. per month, as compared with 379,264 and 126,421 cu. yd., respectively, for the first quarter of the year. This decrease was due to the second curtailment of operations, which took effect about March 1. A daily average of 6753 tons of ore and of 1981 tons of commercial freight was transported over the Bingham & Garfield railway, making a total daily average of 8734 tons, as compared with 13,520 tons per day for the previous quarter. This decrease was caused by the curtailment in the operations of the Utah Copper Company.

Milford.—The Gold Crown Mining Co. is now down to the 400-ft. level and contemplates going on down to the 600-ft. level. It has ore on all levels and the grade of the silver ore is rapidly increasing, the orebody becoming stronger with depth.

Park City.—Shipments from Park City during the week

ended August 23 amounted to 1414 tons, compared with 1352 tons the preceding week. Among the shippers were Silver King Con., 110 tons, and Iowa Copper, 44 tons. The former, it is expected, will be a regular contributor to the camp's output from this time on, due to the finding of the orebody during the week in a raise from the incline in the Electric Light claim. Production follows:

| | Tons |
|---------------------------|-----------|
| Silver King Con..... | 1,180,620 |
| Ontario | 640,000 |
| Judge M. & S..... | 378,680 |
| Judge M. & S. (zinc)..... | 100,000 |
| Daly West | 221,300 |
| Silver King Con..... | 220,000 |
| Iowa | 88,000 |

Total2,828,600

WASHINGTON

Orient.—The First Thought mine has been acquired under an option by the First Thought Gold Mining Co., a corporation formed recently, and operations will be started when financing is complete, according to M. B. Grieve, president of the new company. "The value of the ore removed from the First Thought is in excess of \$600,000, of which about half was a profit," said Dr. Grieve. "It was removed from a lens 50 ft. wide and 150 ft. long between the 100 and 300-ft. levels. The gold content averaged \$16.50 per ton. Diamond-drilling from the bottom level, at a depth of 600 ft., disclosed five feet of ore at \$12 per ton, according to the records. We will reach the ore by sinking a distance of 50 ft., following the course of the drill-hole. Low-grade and some high-grade ore has been disclosed in the operations of our predecessors. Tests of the milling ore have been made by Francis A. Thomson, dean of the School of Mines, University of Idaho, who says it can be dressed by the cyanide process. The mine has been opened on six levels, each 100 ft. apart, that are reached by a shaft. It is equipped with hoisting machinery and with a tramway 2½ miles long that connects it with the railroad. The property has an assay office and is perfectly equipped for the accommodation of a crew." The board of the First Thought Gold Mining Co. is composed of Dr. Grieve, president; O. J. Smith, secretary-treasurer; Joseph McCarthy, an attorney; Samuel Eslick, a contractor; and Frank Ansley, mining man. The capitalization is \$1,000,000, divided into 1,000,000 shares.

BRITISH COLUMBIA

Hedley.—The Hedley Gold Mining Co., near the Washington line, earned \$132,578 in 1918, according to a recent report. Dividends of \$108,000 were distributed in the same period. The earnings were but \$10,000 for the first two months of the year, owing to the expense of keeping the flume free of ice. The size of dividends will be reduced until the return of normal conditions, says the report. The company mined 67,313 tons of ore in 1918. The average grade of 20,028 tons was \$11.18 per ton, and the average of 47,285 tons was \$9.99 per ton, the latter being the lowest in the history of operations by the company. The quantity of ore in reserve is given as 263,000 tons valued at \$9.40 per ton and 87,650 tons valued at \$6 per ton. The value is mainly in gold.

Trail.—The Consolidated Mining & Smelting Co. received 7611 tons of ore in the first seven days of August, according to a report from its smelter at Trail, as compared with 7398 tons in the first seven days of July. Rossland is reported to be under consideration by the Consolidated Mining & Smelting Co. as the site for a concentrator.

KOREA

Umsan.—The Oriental Consolidated Mining Co. extracted \$75,820 worth of gold in July.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

S. P. Lowe is at Salt Lake City, with Chas. Butters & Co.

R. N. Dickman has moved from Florida to La Jolla, California.

T. Bruce Marriott has returned to London from South America.

A. S. Blomfield, of Colorado Springs, is on his way to Australia.

C. C. Broadwater, of the Merrill Company, has gone to New York.

H. E. Ferguson, of the U. S. Geological Survey, is at Manhattan, Nevada.

Walter E. Gaby is in San Francisco on his return from Santa Rita, New Mexico.

Howard D. Smith visited Ely, Nevada, on his way from San Francisco to New York.

J. J. Martins has returned to Oakland, California, from Chiksan, Korea, owing to ill health.

Edward H. Cook, of Culiacan, in Sinaloa, Mexico, is visiting San Francisco on his return from Denver.

J. H. Batcheller has finished the examination work at Strelina, Alaska, and has returned to Mattapoisett, Massachusetts.

T. D. Jarvis, head of the pathological department of the International Nickel Co. of Canada, was in San Francisco last week.

F. H. Newell, president of the American Association of Engineers, addressed the Engineers Club of San Francisco on August 26.

Henry Hanson has returned to San Francisco from the examination of mines at Oatman, Arizona, and Cripple Creek, Colorado.

R. L. Chase, of Denver, has returned from examining properties at Lake City and has left for the western slope to inspect oil-shale land.

F. Sommer Schmidt is now manager of the Florence Goldfield mine, at Goldfield, as well as of the Copper Canyon mine, near Battle Mountain, Nevada.

Arthur F. Taggart and R. B. Yerxa have formed a partnership as consulting metallurgists, with offices and laboratory at New Haven, Connecticut. They were in San Francisco last week, on their way to Miami, Arizona.

Elisha Hampton, who met his death in an automobile accident August 20, near Vallejo, California, was well known to the mining fraternity of the Pacific Coast. He was born in Cornwall, England, on February 24, 1851, and had been engaged in mining since boyhood, having worked in the mines of his native land before coming to California. Since that time he has been superintendent and associated with such properties as the Treadwell, Goldfield Consolidated, the Oneida, Central Eureka, and Bunker Hill. He retired about four years ago and resided at his old home in Nevada City. He leaves a wife, Mrs. Carrie Hampton, two daughters, Mrs. B. C. Austin of San Francisco and Mrs. N. E. Smith of Monrovia, and a son, George Hampton, of Nevada City. The accident in which Mr. Hampton met his death occurred near Vallejo while he was on his way to this city, and at the time of the accident his daughter Mrs. Smith and her three children were dangerously injured.

THE METAL MARKET

METAL PRICES

San Francisco, August 26

| | |
|--|-------------|
| Aluminum-dust, cents per pound..... | 50-60 |
| Antimony, cents per pound..... | 10.50 |

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

FOREIGN EXCHANGE

During the week serious further declines occurred in foreign exchange, but good recoveries have since been made, so that, as fluctuations are measured these days, the position on August 26 is not much worse than a week ago. Sterling at 4.12½ on August 20 established a new low record, but the recovery has been almost complete. This low record may have been caused by the current inflooding of bills being augmented by the letting go of some that had been held back in the hope of a recovery. The delay in definite formulation of credit relief plans and the Lloyd George remarks may have added to the discouragement in such quarters. The vital issue of credit extension is still in the discussion stage. Only specific items rather than a general plan have so far emerged, the latest development reported being a project for a \$200,000,000 loan to France. There is not much doubt that twice that amount could well be employed in this single direction. The difficulty of the situation was brought out by recent remarks of Mr. Stettinius in Paris to the effect that American exporters were showing "no wild enthusiasm" in the matter of long-time credits. It is a plausible surmise in New York that Mr. Morgan's impending departure for Europe, although ostensibly for pleasure, will not be unrelated to the exchange problem.

Gold. Gold for exchange purposes has practically ceased to move from this country. During last two months, since the embargo on shipments of gold was removed, gold coin and bars aggregating \$128,787,500 have left this country. The movement has taken several directions. The most extensive one has been to South America, which has taken \$57,200,500. Asia has been a close second, taking \$30,832,000 for Japan, \$20,423,000 for China, and \$500,000 for India, making an aggregate of \$51,755,000. Movement of gold to Europe practically ceased a month ago when gold stopped flowing from this country to Spain. Since then there have been only shipments of approximately \$500,000 to France and \$200,000 to England. At the time the embargo was lifted, certain bankers predicted total shipments of gold for exchange purposes would be in the neighborhood of \$100,000,000. That this prediction has proved too true will be readily seen when it is noted that, with the exception of the gold flowing to the Far East, the movement has practically ceased, and, if we deduct from the full aggregate the gold shipped to China, because it will not be used directly for exchange purposes but will be worked up, it is found that \$108,364,500 is the extent of the gold movement. Small shipments to South America will continue for a time, but the flow of gold from this country, except to the Far East, appears to be practically over for the time being.

Quotations on August 26 are as follows:

| | | |
|-----------|--------|------|
| Sterling: | Cable | 4.22 |
| | Demand | 4.21 |
| France: | Cable | 8.03 |
| | Demand | 8.05 |
| Lire: | Demand | 9.52 |
| Marks | | 5.00 |

Eastern Metal Market

New York, August 20.

All the markets are more active and prices have in most cases advanced, the recent dullness having disappeared.

The outside market in copper has approached that of the leading producer and quotations are strong on better demand.

Quietness characterizes the tin market with spot tin in better supply and prices consequently lower.

The lead market is higher, the outside quotations and that of the leading interest being nearly the same. Demand is good.

Zinc prices have advanced along with those of copper and the tone is strong.

Antimony is quiet but strong.

IRON AND STEEL

The prospect of an extended strike in the steel industry is the important topic, but it is the opinion of 'The Iron Age' that a general and long continued stoppage of production is not now indicated and that in some quarters it is known that the results of concentrated efforts of organizers in the last two months have been disappointing. Exports of American steel are at a high rate with August orders equal to the June and July record, which represented the full 10% of the product of the independent steel companies which they agreed upon as their export business. There have been recent advances in the foundry pig-iron market. The Carnegie Steel Co. bid 2.50c. on nearly 30,000 tons of plates for battleships but other bids were \$3 per ton higher or at the March 21 schedule. No awards have been announced on the 100,000 tons of rails for the Railroad Administration.

COPPER

The declining tendency of the past two weeks has given place to a stronger tone. In the last week prices have gradually risen until they are about 2c. higher than a week ago. Today electrolytic copper in the outside market is quoted and sold at 23.50c., New York, for early delivery with futures about $\frac{1}{8}$ c. higher for each month beyond September. Lake copper is about 24c., New York, for the same position or at an advance of $\frac{1}{8}$ to $\frac{1}{4}$ c. over electrolytic. There have been several causes for the change in front of the market position. Most of the metal in second hands has disappeared and nearly all the important strikes in the brass and other industries using copper have been settled. There is also a growing appreciation of the fact by consumers and producers that costs are likely to be higher instead of lower, to which a not improbable increase in freight rates will contribute. There is also a prospect of a large foreign demand later as well as the difficulty of increasing production because of labor scarcity. Demand for last quarter is heavy and there is also considerable inquiry for first quarter delivery. Producers are still firm in their quotations of 23.50c. for September-October delivery and are reluctant to sell beyond these positions.

TIN

After standing around 70c., New York, for many months, spot Straits tin has at last fallen in price and today can be purchased around 56 to 58c., New York, which is quoted as the market. It is true that only small amounts are thus far obtainable but with the large quantities probably afloat it is not unlikely that it can in the near future be obtained freely. The cause for this is the arrival in the last week or so of several hundred tons from England which, while con-

signed to consumers in most cases, was re-sold by a few who purchased it, probably at lower levels, a short time ago. There was also considerable Lamb & Flagg tin received. Reports show that there are 5480 tons of tin afloat of which 2050 tons is from the Straits and Australia. Arrivals for the month to August 15 have been 2630 tons, of which 1930 tons came in at Atlantic ports—the largest at these ports for many months. The market has been very quiet on the surface, but there have been fair sales for last quarter delivery from the East—probably 75 to 100 tons per day in the last week.

LEAD

The outside market is considerably stronger and its prices have nearly approached that of the American Smelting & Refining Co. which still quotes 6c., New York. The cheap outside lots have nearly all been absorbed and today it is almost impossible to buy lead under 5.90 to 5.95c., New York, and it is stated that some sales were made at 6c. in the outside market yesterday. There is some prospect of a strike of miners in the Missouri districts and this prospect has tended to advance prices, production not being on a large scale in the industry.

ZINC

Almost daily in the past week prices of zinc have advanced until today prime Western for early delivery cannot be bought for less than 7.75c., St. Louis, or 8.10c., New York, which we quote as the market. The change in the condition of this market is due in large part to the better tone of the copper market as well as perhaps the lead. Demand is better from the brass makers for this reason. Another factor affecting values is the appreciation of the fact that output is now estimated at only 30,000 tons per month, as compared with 45,000 tons per month in 1918. The tone of the entire market is strong.

ANTIMONY

The market though quiet is strong and slightly higher at 9.25 to 9.37 $\frac{1}{2}$ c., New York, duty paid, for wholesale lots for early delivery.

ALUMINUM

Quotations are 32 to 33c., New York, for wholesale lots for early delivery of No. 1 virgin metal, 98 to 99% pure.

ORES

Tungsten: Not very much business is reported but quotations range from \$7 to \$10 per unit in 60% concentrates with some Western producers quoting \$15. It is reported that demand for ferro-tungsten is better, which some makers quote up to \$1.20 per lb. of contained tungsten, but it is claimed by some buyers that as low as \$1.05 can be done.

Molybdenum: Quotations are nominal at 75c. per lb. of MoS₂ in 90% material but no business is reported.

Manganese: Very little if any business is recorded with quotations nominal at 50 to 60c. per unit for foreign ore at seaboard. The market is weak due to the recession in ferro-manganese values.

Manganese-Iron Alloys: The ferro-manganese market is dominated by the offering of British alloy, which is obtainable at \$100 to \$105, seaboard, depending on the seller. American makers still quote \$110 to \$115, delivered, but would doubtless meet British competition where necessary. Spiegeleisen is quiet at \$35, furnace, for 20% alloy.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

PORTABLE POWER DRAG-SAW

A portable power drag-saw marketed by Harron, Rickard & McCone, of San Francisco and Los Angeles, has done much to lighten the burdens of timbermen, ranchers, wood-cut-

Beaver Drag-Saw

ters, contractors, and all others who cut timber into short lengths. The first of these saws, equipped with 2-cycle engine, was put on the market four or five years ago. Since that time many new and improved machines have been developed. The first big improvement was a free-engine clutch, which allows the engine to be started without running the saw-blade. When the engine is cold it can be easily started by throwing the clutch out and relieving it of all load. The latest improvement is the 4-cycle engine, which weighs but 10 lb. more than the 2-cycle. It has many advantages over the old 2-cycle type. Under the worst conditions it will use only two-thirds as much gasoline, and under favorable conditions only half as much. But above all it is reliable, and to give results does not require the fine adjustment of the 2-cycle to keep on pulling its load. For this reason it can be used on other work as well as operating the saw.

These machines can be operated and moved on the log by one man and carried from log to log by two men. Consequently, thousands of farmers have taken to them during the past few years, thereby solving the problem of fuel shortage. Contractors use them for clearing right-of-way and cutting timber into exact lengths, and loggers use them for cutting fuel for their donkey-engines and locomotives, as well as on the pond for cutting timber into shorter lengths.

NEW OLIVER FILTER CATALOGUE

The Oliver Continuous Filter Co., San Francisco and New York, has issued Bulletin 12, a new catalogue which gives in attractive and useful form the latest developments and improvements in the Oliver filters and auxiliary equipment. For the benefit of those unfamiliar with these filters, their general construction and uses are first described, including the filtration and washing of ore slimes resulting from cya-

niding, the de-watering of flotation concentrate from copper, lead, and zinc ores, the complete removal of copper solutions from oxidized copper ore slimes that have been leached with sulphuric acid, and many other filtration uses in the manufacture of beet sugar, caustic soda and other chemicals, dyes, paints, starch, and gluten. The wide range of materials handled by Oliver filters is given in a list of over 80 products. This is followed by a table of standard sizes, and a short description of capacities with different materials. The advantages of the Oliver filters and details of construction are then given, illustrated by both diagrams and photographs. The operation of the filters and necessary auxiliary equipment receive a suitable amount of space. The art of filtration is next discussed clearly and at length, grouping all existing types of filters under four heads and discussing the advantages and disadvantages of each type. This is followed by a description of vacuum pumps and compressors, both reciprocating and centrifugal, speed reducers, and the Oliver sand-table filter. Special filters, such as for laboratories and technical schools, and for acid solutions, are adequately treated. The bulletin closes with a brief summary of the products manufactured by the Oliver com-

pany, an incomplete list of Oliver installations, and a statement of Oliver service in the way of laboratory tests and engineering on erection. This new catalogue, of which the illustration shows the front cover, is attractively illustrated

and well printed on good paper. It treats clearly the filtration problem and the way in which it has been solved by the Oliver filter, and will be most useful to those interested in filtration.

COMMERCIAL PARAGRAPHS

The Edison Storage Battery Co. announces the removal of its Pittsburgh office to Room 431, Union Arcade Bdg.

The Chicago Pneumatic Tool Co. announces the appointment of J. L. Canby as district manager of sales at Chicago, succeeding Nelson B. Gatch, who has been transferred to New York as district manager of sales.

The Pelton Water Wheel Co. of San Francisco has issued Bulletin No. 12 on Pelton water wheels. Many of the standard types of wheels and enclosed motors are illustrated and described, together with water wheel accessories and illustrated examples of the many applications to which this wheel is put. Engineers and mine managers will find this a valuable publication especially for the engineering information contained therein.

The Sullivan Machinery Co. announces the appointment of R. S. Weiner as district manager at El Paso, Texas, succeeding Don M. Sutor. Mr. Sutor has been transferred to the company's St. Louis office as district manager for Missouri, eastern Texas, Oklahoma, Kansas, western Kentucky, and western Tennessee. The company's office at El Paso remains at room 511 Mills building, as heretofore.

The Overstrom Manufacturing Co. announces that its Los Angeles factory and offices have been closed, the factory having been moved to Berkeley, California, where it will be more closely in touch with and directly under the supervision of the main office of the company in San Francisco. The company therefore requests that all communications, inquiries, orders, etc., regarding Universal concentrating tables, for use in the United States and its possessions, be sent to the Overstrom Manufacturing Co. at its main office, 1215 First National Bank Bdg., San Francisco.

Booklet No. 118, entitled 'Drills,' has just been issued by the Sullivan Machinery Co., Chicago. This little pamphlet of 32 pages is published to illustrate and describe briefly an efficient drill for every kind of rock excavation, in mine, quarry, or on public work. The illustrations show the different drills both in detail and under working conditions, and are accompanied by specifications and brief statements of the work for which each type is best suited. With each drill is given a reference to a Sullivan Bulletin that describes it in greater detail. Submarine drills, diamond-drills, drill-sharpeners, and air-compressors are also described briefly.

An electric apparatus for detecting small power losses and so determining the efficiency of gears has recently been perfected by C. M. Allen, Professor of Hydraulic Engineering at the Worcester Polytechnic Institute. A number of tests were made with this apparatus to determine the best sort of gear lubricant. The best results were obtained with a mixture of heavy oil and flake graphite. With a perfect blending of the oil and graphite there was a minimum loss through friction. The Joseph Dixon Crucible Co., Jersey City, N. J., claims that this test proves that flake graphite properly combined with oils and greases is unexcelled because of its ability to build up microscopic irregularities in gear surfaces, forming a tough film of graphite, and so preventing metal-to-metal contact.

'C-H Mine Duty Apparatus' is the title of a new 8-page 8½ by 11-in. booklet just issued by the Cutler-Hammer Mfg. Co., Milwaukee, Wisconsin. This new booklet makes special reference to the mine duty apparatus installed in the plant

of the St. Louis Smelting & Refining Co. at St. Francois, Missouri. A detailed description is given of the method of handling the ore from the three levels of the mine until it is ready for shipment. Special emphasis is laid on the hoist and conveying machinery and the C-H automatic control and safety apparatus used on this machinery. The pamphlet is attractively illustrated, showing the mine-hoist control panel, master switches, limit switches, overspeed governors, and electrically operated brakes, as well as the automatic starters for the crushers and conveyors. These starters are controlled from push button stations and the speed of the conveyors and crushers is governed by armature regulators. The front and back covers of the booklet display a panoramic view of the buildings above the mine, including everything from man-hoist to chat dump.

The Bonnot Co., Canton, Ohio, has issued an illustrated catalogue describing the Holbeck pulverized coal systems. Many of the data presented therein are of an informative nature. A novel method of illustration is used in the form of perspective drawings of pulverized coal plants, showing in detail the various units completely assembled. The catalogue is profusely illustrated with photographic reproductions of actual installations, showing the wide variety of application for this method of burning coal. Illustrated descriptions are given of the various individual pieces of apparatus that enter into the equipment of complete plants. It is evident that the Bonnot Co. has taken unusual care and thought toward providing for any contingency, however remote, that might interfere with successful continuous operation. Automatic mechanical handling of the coal from the time it enters the receiving bin to the performance of its function as fuel are characteristic of the Holbeck system. Engineers, designers, and mine and smelter managers will find this publication useful in helping them toward a better understanding of the use of pulverized coal as a fuel. Copies of this catalogue will be sent gratis upon application.

The transcontinental trip of two complete U. S. Motor Transport Corps companies of war strength, consisting of 42 army trucks, which started from Washington on July 7, is receiving an enthusiastic welcome at all points along the Lincoln highway. The trucks are scheduled to arrive in San Francisco on September 1. Detailed road maps of each State to be traversed and national highway maps were supplied by the National Touring Bureau of the B. F. Goodrich Rubber Co. The army truck train is as follows: 5 passenger cars, 35 trucks, all of army types, 2 ambulances, 6 motorcycles, 2 tank trucks, 2 kitchen trailers, 2 water tank trucks, 1 engineer shop truck, and 1 searchlight truck. Technical personnel from the motor transport corps, engineer corps, medical corps, field artillery, and air service are making the journey. According to Brig. Gen. Charles P. Drake, chief of the Motor Transport Corps, the purposes of the long trip will be to provide service and performance tests of various types of army motor equipment, to collect data to be used in connection with the technical training of the personnel of the M. T. C., and to provide an opportunity for extensive study in terrain observation, to demonstrate the practicability of long distance commercial motor truck transportation, and to point out the necessity of governmental appropriations to assist in the continuous improvement of all through connecting routes in the United States, to provide an opportunity for procuring recruits for the Motor Transport Service. The convoy is under command of Colonel A. Owen Seaman of the General Staff who will have charge as far as Salt Lake City, Utah, at which point General Drake will take personal command. Service stations and branches of the Goodrich company, whose equipment is on a number of the passenger cars and trucks of the army motor train, will render expert tire service along the route from coast to coast, where the occasion demands.

Established May 24, 1860, as The Scientific Press; name changed October 20 of the same year to Mining and Scientific Press.

Entered at the San Francisco post-office as second-class matter. Cable address: Pertusola.

Branch Offices—Chicago, 600 Fisher Bldg.; New York, 3514 Woolworth Bldg.; London, 724 Salisbury House, E.C.

Price, 15 cents per copy. Annual subscription, payable in advance: United States and Mexico, \$4; Canada, \$5; other countries in postal union, 25s. or \$6.

Specially designed and built for laboratory requirements

Appreciating the importance of having a laboratory table properly equipped for use in college laboratories, mill offices and testing plants we have developed

The WILFLEY TABLE

No. 13—Laboratory Model

which has a deck 14 in. by 30 in. and is equipped with the latest Wilfley enclosed self-oiling motion.

The stroke and side inclination can be adjusted while the table is running. Two decks are furnished, one of which is riffled for roughing, the other riffled for fine work. These decks are quickly inter-

changed—it is only necessary to loosen the draw bar nut and lift the deck out of its bearings. Water and feed boxes are attached to each deck.

Despite its small size, the No. 13 embodies all recent Wilfley features, and can be depended upon for accurate work.

Details furnished promptly on request

Represented by Harron, Rickard & McCone on the Pacific Coast

CARNEGIE'S bequest of annuities of \$10,000 to Mr. Taft and to Mr. George, and of \$5000 to the two widows of ex-Presidents, is one of the most gracious things he ever did. The British Premier will be entitled to a pension and he may decide that it is improper for him to accept the bequest of his American friend, but the other annuities suggest once more that some statutory provision should be made for the President of the United States when he retires from office.

RARELY does a daily newspaper publish an article on a technical subject worthy of being re-printed in a technical journal, but the 'New York Times' is a great newspaper, probably the best in our language, so we were not surprised to read an article on deep well-sinking in its issue of August 21 and to find that the article was an exceptionally good one. We give it to our readers on another page. It must have been based upon first-hand information, probably from the office of the State Geologist of West Virginia. The only part of the article that is open to correction is that in which the depth of the deepest mines in the world is given. This is not quite up to date, as many of our readers will note. The deepest shaft is that of the St. John del Rey, a gold mine in Brazil, which is now 6326 feet vertically below the surface and is likely to be further deepened, despite the difficulties of temperature (116°F.) and ventilation. For many years the No. 5 shaft of the Tamarack copper mine, which is 5368 feet deep, held the record, but it is far behind now and is shut-down, as are the deepest mines of Pzibram, in Bohemia, and of Bendigo, in Australia.

AMONG the articles we publish this week is one by Mr. Lloyd C. White, who describes the No. 1 concentrator of the Mountain Copper Company, with which he was connected as metallurgical engineer before his recent entry into partnership with Messrs. Albert Burch and Oscar H. Hershey, in San Francisco. Mr. P. B. McDonald, who writes on the guild system, was formerly on our editorial staff and is now in New York. Mr. C. A. Grabill, of Berkeley, has recently returned from South America and gives some useful hints on the buying and selling of ore in Chile. Mr. Chester W. Purington, formerly on the U. S. Geological Survey and since then prominent in the technical direction of mining enterprises in Siberia, is particularly well informed con-

cerning the mining industry of Asiatic Russia. The article that we print was contributed originally as a series of contributions to the 'Echo' of Vladivostok.

UPON another page we publish a short review of an old book on Cornwall by Mr. J. C. Murray, formerly editor of the 'Canadian Mining Journal' and a writer well known on both sides of the frontier that has no guns or fortifications. In the antique phrasing and quaint spelling of Richard Carew's volume the reader will find many examples of archaic English, and he will recognize some of the terms used by the Cousin Jacks, who have played so useful a part in the mining development, for example, of the Lake Superior copper mines, of the gold mines of Gilpin county in Colorado, and of Nevada county in California. The gold that "they kept in quills" recalls the use of 'pure quill' to express richness of ore; we are reminded also of the fact that the pioneers from Georgia who first prospected Cherry Creek, near Denver, in 1849, put the gold they found into quills made from the feathers of wild geese. The Cornish cherished the fallacy, as old as mining, that veins and lodes increase in size and richness the deeper they are followed. They did it out of a meagre experience; our modern promoter does it in the face of a vast array of contrary testimony. The reader will find many delightful touches in the quotations given by Mr. Murray and will join us in thanking him for this pleasant diversion from the beaten ways.

COBALT is the latest mining centre to suffer from the prevalent industrial unrest. The strike of the miners, after many premonitory rumblings, finally broke forth on July 23, when 2200 men stopped work. The Cobalt Miners Union, which called the strike, is acting under the leadership of the Western Federation of Miners, and that is the point that seems to have prevented a peaceful adjustment of the difficulty. The issue has not been wages or profit-sharing or living conditions, but the old dispute over the recognition of the union. The mine operators on their side have organized to form the Temiskaming Mine Managers Association, and at the present writing the deadlock is complete. The pumps have been withdrawn from the mines, which are being allowed to fill with water. Apparently the Managers Association has decided that the issue must be fought out sooner or later, and that nothing is to be gained by delaying set-

tlement. Meanwhile the Great War Veterans Association has taken a hand. This organization, if it can manage its affairs in wise and orderly fashion, has great possibilities for influence on Canadian public questions. In this instance it seems to be throwing its weight on the side of breaking away from the Western Federation of Miners and forming a new union, with which, presumably, the Managers Association would not refuse to deal. The chief stumbling-block in the whole trouble is the reputation of the Western Federation of Miners. Senator Robertson, the Minister of Labor, who made many attempts to prevent the strike by conciliatory methods, and has, since it started, tried vainly to settle it by arbitration, states that the Western Federation is under new leadership, that the men whose lawlessness brought it into evil repute are gone, and that at the present time, in insisting upon its recognition as the power behind the Cobalt Miners Union, it is merely insisting on the right of collective bargaining; he says that much might have been done with a little yielding on the part of the mine managers, and bewails their unfortunate obduracy. On the other hand, the Minister has been criticized as helping to precipitate the strike by showing sympathy in favor of the labor leaders, who felt that, through him, they had the Government back of their demands. The mine managers insist that the leopard cannot change his spots, and refuse to deal with any union affiliated with the Western Federation of Miners. It is hoped that the Great War Veterans Association may be able to adjust the difficulty, although its efforts have not yet been attended by much success. A committee of returned soldiers has asked to be relieved of its duties, stating that the feeling of distrust is still too great for mediation, and prospects are not bright for a speedy settlement. Grave suspicion exists that the grievance of the men, who, during the visit of the Royal Commission on Industrial Relations in May, seemed among the most contented workers in Canada, is not justified, and that the whole affair is the attempt of the unscrupulous leaders of the union to stir up trouble in a peaceful community and capitalize to their selfish advantage the present unrest of industry.

WE learn, with interest and sympathy, that the scientific and technical staffs of the U. S. Geological Survey have been impelled to call a meeting to protest against the order of the Public Building Commission reducing by one-half the space available for them in their quarters in the New Interior Building at Washington. Our readers need not be told of the value of the work done by these men in behalf of the mining industry; the industrial, social, and economic progress of a country like ours is largely measured by its capacity to encourage scientific research and to place the results in the hands of those by whom they can be applied to utilitarian purposes. The Geological Survey draws its staff from among the best educated men in the community, from men of the highest ideals and the keenest intelligence. They are deserving of considerate treatment by their employer, the Government. After thirty years of the

most efficient service the Geological Survey found itself housed under crowded and insanitary conditions, so prejudicial to efficiency as to menace its standard of work and endanger the health of its staff. A protest to the Public Health Service resulted in the preparation of plans for a building specially adapted to this scientific bureau, and in 1913 a bill was passed by Congress authorizing the construction of the New Interior Building, of which the Survey now occupies one-third. The present personnel of the Survey includes 320 geologists, engineers, chemists, and other technical employees, besides 260 on the clerical staff and 121 skilled mechanics and workmen. By the proposed reduction in allotted space the first two groups, aggregating 580, must do their work in 20% less floor-space than that occupied by them in their former crowded and insanitary quarters. It is said that the reduction in space is made in the interest of economy; it may be economical but it is not economic; it is the kind of cheapening that defeats its purpose. The health and comfort of the worker is a matter of immediate practical importance; it is particularly important in the case of brain-workers, who, to be at their best, require quiet, freedom from interruption, proper lighting and ventilation, easy access to books of reference, drafting-tables, room for maps and specimens, and other special equipment. Packing technical investigators like steers in a cattle-car is a huge mistake; the scientific worker is worthy of more than his hire; he is entitled to the best consideration of his employer, more particularly of an employer who represents the Nation. These men are under-paid; most of them receive less than the unskilled laborer of today and not many of them are paid better than a skilled manual workman; they forego the making of money for the love of science; they are scholars and gentlemen drawn to their work with fine enthusiasm, for the sake of which they are willing to live simply, even precariously. They deserve to be treated properly. If they are both under-paid and badly housed, they will be compelled to go elsewhere. This is not a time for trying the patience of the scientific worker and educator; he is peculiarly the victim of the high cost of living; if the Government is so foolish as to deny him a chance to do his work well—the professional ideal—it will lose his services. During the last decade the Survey has lost several of its best men; it has failed to hold them because of the greater attractions offered elsewhere—attractions not wholly pecuniary; it would be a great blunder to blunt the loyalty and dull the enthusiasm of those that remain by housing them uncomfortably and trespassing upon their self-respect. The mining industry as a whole, we feel sure, will join in protesting in their behalf against the step that the authorities at Washington propose to take.

IN the article by Mr. A. H. Heller in our issue of August 2 on the operation of the Horwood process at the Afterthought mine, the horse-power used by each Marcy mill was stated to be 125. Mr. Heller asks us to make a correction. The nominal horse-power for each mill is 100, but the actual running horse-power is only 68.

Arrival of the Fleet

On May 6, 1908, the people of San Francisco stood on their seven hills and waved a welcome to the fleet under Admiral Evans then on its way around the world. Yesterday they welcomed the mightier armada of the Pacific Fleet, under Admiral Rodman, as in single column ten miles long it entered the Golden Gate, to make its home on this coast. History repeats itself; eleven years ago as yesterday the fog threatened to mar the glory of the day, but it shifted just before the long line of battle-ships entered the bay, and when the flagship passed Alcatraz island toward the inner harbor the sunlight broke through the rising mist and quickened the gray hulls into living beauty. The blue sky of California canopied the scene ere the leviathans of war had come to anchor, as on the former occasion, but the tide on whose flood they entered served to symbolize the flow of human events in which the American navy had but lately played a splendid part. In 1908 we looked on the fleet and thought of the Spanish war; yesterday the 'Oregon' revived those memories, as the Secretary of the Navy, with the Governors of California and Nevada, stood on her deck to receive the salute of the entering warships. Then we thought of war; today we think of peace. The fleet by its service overseas had brought the War to an end and we looked upon it as insurance against war in the future. In 1908 Admiral Evans and his 18 ships came around the Horn; this time Admiral Rodman and his 51 ships came through the Panama Canal, and at our feet lay sundry remnants of the 1915 Exposition, which had celebrated the completion of the isthmian waterway. Yesterday the drone of engines in mid-air made us glance skyward, as aeroplanes flew overhead and their pilots took photographs of the arriving squadrons. In 1908 man's mastery of the air was not anticipated, although in the following year Bleriot, by crossing the English Channel, proved that another dream had come true. Eleven years ago the coming of the fleet served also to celebrate the rise of San Francisco from the ruins of the earthquake-fire that two years before had brought death and devastation to this community. We thought then that imagination could not conjure a worse horror than that calamity; yesterday we celebrated the ending of a greater calamity and hoped intensely that the conflagration of war and the earthquake of social disruption might be spared to us and our children in the years to come.

Engineering Unity

The president of the American Association of Engineers, Mr. F. H. Newell, is signaling his year of office by visiting the principal centres of engineering activity, all the way across the continent, from Boston to San Francisco. During his short stay in our city he gave an address before the Engineers Club and had no difficulty in holding the close attention of a thoroughly repre-

sentative gathering of the profession while he explained the origin and aims of the Association. It started early in 1914 as an organization of the engineers employed by the City of Chicago, and it had barely made a start when it was rent in twain by a difference of opinion as to the desirability of affiliating with the labor-unions. The half that did take the extreme step was duly absorbed and lost its identity, whereas the other half proceeded to work out its own salvation, incorporating under the laws of Illinois as the American Association of Engineers. From the first Mr. Newell gave it his sincere support. As former chief of the U. S. Reclamation Service he had a large acquaintance in the profession and with his gift of leadership he was able to rally a considerable number of recruits, in which he was aided notably by Mr. W. H. Finley, formerly chief engineer and now president of the Chicago & Northwestern Railroad, who was his predecessor in the presidency of the Association and attracted many of the younger railroad engineers to it. Mr. Newell spoke feelingly of the late Arthur Kneisel, first president of the Association, "who literally gave his life to the cause of engineering unity and brotherhood," for, by his exertions, he overtaxed his strength fatally. Enrollment at the present time, we are told, is at the rate of 1000 new members per month, a fact that in itself commands attention. Mr. Newell asserted that there existed "a ground-swell movement" among the younger engineers, who were gaining a larger pride in their profession and a keener vision of its duties to the community; also of the community's debt to them. One of the first moves made by the Association was to wait upon the Railroad Administration, and ask for an increase in the salaries paid to the civil, mechanical, and electrical engineers, who up to that time had been paid at the same rates as obtained fifty years ago, when the purchasing power of the dollar was three times greater. Since then the Association has sent its representatives to interview State bureaus, municipal councils, and other employers of engineers, and has succeeded in obtaining raises of salaries. Indeed, this feature of its program—the bread and butter feature—differentiated the Association from the ordinary technical societies from the very start. Next it is undertaking to help engineers to obtain employment, and has established a bureau for this purpose. Moreover, at its various meetings the subjects discussed are not the purely technical phases of engineering, but such as are related to the life of the engineer himself and his activities as a member of the community in which he lives. The old idea that the term 'engineer' is synonymous with 'engine-driver' is pretty well exploded, for the modern world recognizes that the engineer is "a man of ingenuity", as Mr. Newell said. He is "the most useful man in the community" and it is ludicrous to see how even in these days he is overlooked when appointments are made for public offices requiring a knowledge of engineering; for example, when the mayor of Chicago had to appoint a smoke inspector, he selected a dentist! Mr. Newell made it clear that the organization of which he is president has for its purpose

the strengthening of the engineer's status in society and an increase of the engineer's participation in public affairs as a man and a citizen peculiarly fitted to give valuable service to the State. We are glad that he corrected the prevailing idea that the Association was drifting toward labor-unionism; instead the Association aims to preserve the independence of the profession. He and his friends have plenty of genuine enthusiasm for their cause and they are accomplishing results not to be ignored by the older technical societies.

War Minerals Relief Scandal

Those who read our editorial of August 16 on this subject should read the letter from Mr. J. E. Spurr on page 323 of this issue. He makes it clear that he himself favored equitable interpretation of the Relief Act and that it was not his fault if the Attorney-General interpreted the intent of it otherwise. Mr. Spurr suggests that our criticism indicated some sort of notion that the Attorney-General had "authority to modify legislation". We are perfectly well aware that he has no such authority, and our remarks do not justify any such inference. We do believe, however, that as the administration of the Act was placed in the hands of the Secretary of the Interior, he could have given more generous interpretation, such as Mr. Spurr advocated, without incurring criticism. If the language of the Act "could hardly be more clear", why did he have to ask the Attorney-General to interpret it? We note Mr. Spurr's tribute to the work of Mr. Burch and his assistants; it is well merited. We have not the least doubt that Mr. Spurr's prolongation of his own war-time connection with the Government was prompted by patriotic reasons, for we know that he gave his services unreservedly to the Nation during the War and that those services proved of great value in several directions. It would be entirely unnecessary for us to mention this phase of the matter if he had not, in his letter, referred to it himself. Mr. Spurr's further remarks about the "request or demand" on which the miners acted are interesting, but his attitude toward Mr. Toll is not in harmony with them. He dismissed that engineer because he gave a letter that assisted a claimant in obtaining compensation. That is the reason given in the telegram of dismissal. In a confirmatory letter he says that he is well satisfied with Mr. Toll's reports, "but it is necessary in this work to have an examiner without bias, one way or the other, and these letters and affidavits which you have made to help out claimants evidently take you away from the judicial position." We see nothing in Mr. Toll's statements, as given to various claimants, to justify the charge of bias; he simply put in writing what he had been authorized to state at the time when, as an assistant of Mr. Burch, he had taken part in the official campaign for stimulating the production of war minerals. Mr. Spurr says that he was "advised by the Commission" that Mr. Toll received payment for "reports, letters, and affidavits for claimants". This is not true; Mr. Toll did examine mines and

did make reports while out of the Government service, but not while he was in it, nor did he at any time ask or accept payment for confirming by writing the verbal statements he had made to the miners during the period when he was authorized to make such statements. Mr. Toll was out of the Government service between September 15 and June 2. Is it suggested that he should have abstained from practice as a mining engineer during this interval on the mere chance of re-employment by the Government, or is it suggested that the reports he made on mines for private clients would be more optimistic than those he might make for the Government? Such a suggestion is an insult to the profession and an impertinence to Mr. Toll, whose record gives no excuse for it. As to whether he over-stated the facts in his letter to Mr. Payne, we quoted Mr. Spurr's telegrams to the same effect and the one sent by Mr. Sanford to the President of the San Francisco Chamber of Commerce. Whether Mr. Spurr's telegrams were dated before or after Mr. Toll's statement to Mr. Payne does not matter, for they indicate the probability that Mr. Toll was only saying what he believed himself justified in saying on the authority of Mr. Burch and other Government officials. He had no written instructions to this effect, we understand, but he was told to advise the miners not to start any large work the cost of which could not be redeemed within a year, and this warranted the inference that the market would be maintained by the Government for one year at least. Shortly afterward, on August 8, the War Board stated that the Californian production of chrome must be maintained and that the Board itself was "ready to take whatever steps are necessary". A month later an assurance was given that the market would be maintained for the first half of 1919. We quoted the telegrams, in which these assurances were given to the mining public, in our issue of August 16. Whether Mr. Toll "over-stated the facts", as Mr. Spurr asserts, we leave the reader to decide for himself. We took up the cudgels for Mr. Toll because we believe that the 'Mining and Scientific Press' can perform no better service than to defend a member of the profession when he is unjustly treated either by an official or by a corporation. We believe that the treatment meted to Mr. Toll is unjust to him and derogatory to the mining profession. As to the personal touches in Mr. Spurr's letter, in so far as they are aimed at the Editor, we waive the opportunity to retort in kind. When he has been an editor himself he will learn that criticisms must be made as a matter of public policy even at the risk of imputations of various kinds. We have no quarrel with Mr. Spurr personally, and that is why, in our editorial of August 16, having once mentioned him by name, we referred to him repeatedly as the 'Chief Engineer' for investigative work under the Act. We were criticizing an official, not Mr. Spurr as an individual. We did not ask him for an explanation, because the whole case at issue was stated in the telegram of dismissal sent to Mr. Toll. To have asked Mr. Spurr privately for further explanation would only have aggravated the controversy.

DISCUSSION

Blast-Furnace v. Reverberatory in Copper Smelting

The Editor:

Sir—Referring to the article by O. E. Jager in your issue of June 21 and the letter from Walter G. Perkins in your issue of July 19, under the heading of 'Exit the Blast-Furnace', I beg to say that the blast-furnace has made its exit and re-entrance several times in the history of copper smelting in this country. Having been interested in the development of both the blast-furnace and the reverberatory, I think I can speak impartially.

There is no doubt but that at the moment, in favored localities where pulverized coal or fuel-oil can be obtained at a much cheaper rate than coke, the reverberatory has the better of the argument, but there is always something turning up in favor of the other side in every controversy. It resembles the perpetual fight between armament and projectiles that we are all much more familiar with at present than we were prior to 1914.

The latest improvement in blast-furnace practice is the introduction of pulverized coal at the tuyeres, the notable examples of this being the Tennessee Copper Co. smelter and the International Nickel Co.'s plant at Copper Cliff, Ontario. If the experiments now being tried at various plants, besides the two mentioned, prove that pulverized coal can be used economically in the blast-furnace, either with or without a proportion of coke, the probabilities being that a certain proportion of coke will be necessary, the existing interest in blast-furnace practice will receive an impetus.

At one plant where the reverberatory was for a time dominant, it has had to take a back seat recently, namely, that of Copper Cliff, where the tendency is to return to blast-furnace practice. Also please note that when the reverberatory smelter-man runs across a refractory charge, he immediately puts his blast on the job, if he has one, and if he hasn't, he tries to dispose of the refractory material to some more fortunate metallurgist who is provided with the necessary blast-furnace.

There is no talk of the Tennessee Copper Co. giving up its blast-furnaces.

The new plant being erected in Chile for the Braden Copper Co. contemplates the use of the blast-furnaces entirely, using nodulizing-furnaces to prepare the charge. Today it is about a stand-off in cost between nodulizing or sintering for blast-furnace practice and roasting for reverberatory practice.

The essentials for successful reverberatory practice today are much as they have been in the past, namely, self-fluxing ores, cheap fuel, and cheap silica-brick; whereas for blast-furnace practice the charge may be more refractory, but must be either sintered or nodulized or come naturally in lumps, and in addition the fuel and power must be comparatively cheap.

The exit of the blast-furnace is not yet in sight, at least the door has not opened widely. Both styles of furnaces have their field, but for the moment, owing to the great increase in tonnage treated by oil-flotation and the improvements in reverberatory practice, the reverberatory seems to be gaining materially in tonnage treated.

New York, August 13.

E. P. MATHEWSON.

The War Minerals Relief Scandal

The Editor:

Sir—I note your editorial on this subject in your issue of August 16, and it apparently calls for a reply. I will not attempt to follow the sinuosities of your article, but will go straight to the point and give certain information which you could have had before if you had wanted it.

(1) It may interest you to know that on May 9, 1919, I submitted to the proper authorities a plan to interpret the provision which Congress had inserted in the War Minerals Relief Act (limiting the possibility of compensation to those who had produced certain minerals "in compliance with the request or demand" of certain Departments and War Boards), by assuming that the *general Government campaign of stimulation* could be interpreted as such a request or demand. There follow extracts from my presentation, which was a long one and contains much that is not germane to the point I wish to make:

"The proper application of the Act and the correct interpretation of the phrase above quoted can only be made through a close knowledge of the history of the situation which led miners to feel that the Government had enlisted assistance in a program of which the Government itself failed to carry out its part, and led Congress to see the justice of their complaint and to provide for compensation at the Secretary's discretion."

"The activity of the Government which gave rise to the situation on which the claims of the miners for compensation were based, was that of the Shipping Board and the War Trade Board which, in accordance with the Executive Order of the President to secure ships for

military purposes by cutting down imports, formulated and put into effect a program for the restriction of imports of pyrites, chromite and manganese, and called on the country in unmistakable and vigorous terms to produce enough to make good the deficiency, as an act of patriotism."

"The general active stimulation and vigorous encouragement which amounted practically to a general 'request or demand' by the Government concerning these minerals warrants, in my opinion, a general plan of compensation for the losses entailed in mining these minerals as a consequence of this governmental campaign of stimulation; and is a far stronger justification for compensation by the Government than the representations or informal advice, opinion, or encouragement of any minor official or officials of the Government."

(2) You must know, however, that in the United States the only body or individual authorized to dip its hand into the public Treasury is Congress. The question was, therefore, not what I or you, the Commission or the Secretary, would like to pay out of the Treasury, but what Congress had authorized to be paid out; our personal opinions do not warrant our tapping the public funds, whether for our own enrichment or that of our friends, or of attempting to do so; and fortunately for the public, there would be little guarantee of personal safety to anyone thus attempting to carry out his convictions. The matter was finally referred to the Attorney-General, as the official interpreter of legislative language, and he rendered on July 1, 1919, a decision, in which he clearly showed from the language of the Act and its history, the intent and authority of Congress. He stated, "The language used could hardly be more clear or allow less room for construction. No claim based upon a general solicitation or appeal is recognized by it, but to come under the statute the claimant must have been asked specifically by either the Department of the Interior, the War Industries Board, the War Trade Board, the Shipping Board, or the Emergency Fleet Corporation to produce or prepare to produce one or more of the four named minerals."

Even the Attorney-General, you must know, has no authority to modify legislation. Your editorial would indicate that you thought he had.

(3) The work done by Mr. Burch and his assistants in stimulating the production of chromite and other war minerals on the Pacific Coast was of the most effective and valuable character and their patriotic services have always been fully appreciated by their colleagues in Washington. The stimulation was of the most vigorous kind which circumstances and their authority permitted; not only individuals were exhorted, but addresses were made by the engineers at public gatherings in mining districts. (Entirely similar activity, it may be noted, was carried on by Government engineers and geologists in the East.) It was on account of this most valuable work and their familiarity with the field that on the organization of the War Minerals Relief field examinations as many of the old staff as could be secured were

re-engaged. Only Messrs. Shonts (in Oregon) and Messrs. Cameron and Toll (in California) could be secured.

(4) All decisions relative to War Minerals Relief are in the hands of the Commission. On request, I undertook (dare I say, for patriotic reasons?) to prolong my war-time connection with the Government long enough to organize the investigative force, but no longer. The function of this force is to provide the Commission with such facts as they may request, whereon to base their decisions. Therefore, I do not know what their attitude may be on any question, but personally (not officially) I have always felt that the case of the Pacific Coast chrome miners was one of the strongest which they will have to consider on this very point of "request or demand", and precisely on account of the requests presented by our field engineers. And in the case of each claim which comes up for examination (this applies to the whole United States) the field engineer or other government official who is named by the claimant as having made upon him a request or demand for production, is immediately interrogated by special letter as to the facts, and such testimony is very influential in determining the order of examinations. In the case of large numbers of claims we have the written testimony of engineers, nearly all of them now on our staff or on that of the Geological Survey, that they made such request or demand, and in my personal opinion, these represent a very strong class of claims for the Commission to consider.

(5) The claim of L. R. Payne & Co., No. 480, was judged on the basis of Mr. Toll's testimony to belong in the above class, and a field examination was ordered July 18, 1919, by Harry Sheafe, engineer (employed on recommendation of Mr. Burch) and E. L. Fleming, auditor.

(6) What, then, was the basis for discontinuing Mr. Toll's services as field examiner, of which he and you make a national issue?

You state that he was dismissed "for telling the truth". Judged on the basis of this statement alone, you would have been in little danger of dismissal had you been in Mr. Toll's place.
